

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

# Food Requisites For Cottage and Camp

That lessen the task of *HOT-WEATHER* cooking and add relish to the *Summer Diet*

## *Armour's* Extract of Beef

For making cold bouillon, consomme, salad dressing, sauces, and beef tea.

*At druggists or grocers, or 2-oz. bottle by mail in U. S. on receipt of 50c.*

## *Armour's* French Potage

AN EVAPORATED SOUP

**Packed in Glass Jars, 15c. Each  
Pure, Wholesome and Delicious**

To make soup, add contents of jar to quart of water, boil, season and serve.

Will keep in any climate.

*At all grocers, or sent by mail in U. S. on receipt of price.*

## *For the Soldier, Sailor, Tourist or Sportsman*

A day's rations may be carried in vest pocket. A handy way to use Beef Extract where the conveniences of the kitchen are not to be had.

*Sold by all druggists or grocers, or sent by mail in U. S. on receipt of 35c.*

VOL. XXVI.

NEW YORK, JULY, 1902.

No. 1.

### THE PROGRESS OF THE WORLD.

*Peace and the Coronation.* Edward VII. had been on the throne for a year and four months. He had waited a long time to come into his inheritance, and, from the very moment of the Queen's death, had shown himself every inch a king, conscious of his prerogatives, alert, industrious. The manner of his reign had become known throughout his empire, and had been accepted with good will everywhere. His friendly attitude toward other nations had given an additional guarantee for the peace of the world. Thus his coronation, toward the end of June,—while interesting, certainly, as a pageant, and a curious exhibition of formalities that do not belong to our modern life,—had no relation at all to anything vital in public affairs. For many Americans it is not quite easy to understand why so practical a people as the English should take the coronation show so seriously,—allowing it, seemingly, to outweigh, in their estimation, as a matter of concern and importance, the ending of the South African war. The King, however, had all along perceived that peace was the one thing needed to make his coronation something more than a gaudy and an empty formality. Thus he used every influence consistent with his position in a constitutional government to have the conditions of surrender made such for the Boers that they could accept them and lay down their arms with self-respect and honor.

*A Subject for Historical Controversy.* The Boer war will be one of the great subjects of discussion and, doubtless, of historical controversy for at least fifty years to come. From the very moment when the Boers took up arms, issued their ultimatum, and crossed the line into British territory, Transvaal independence was absolutely doomed. If England had been at war with another power, the Boers would, of course, have won their cause easily, and would have acquired the whole of British South Africa. But every great nation for thirty years has made it the cardinal object of its policy to keep out of

war with any other power of first-class rank; and there was never at any moment the slightest ground for the Boer hope of formidable help from other quarters. It was not at all unnatural that British imperialists,—of the Cecil Rhodes type in Africa, and of all types in England,—should have looked forward to the annexation of the Transvaal. This became especially true after Mr. Rhodes had succeeded in adding to the empire Bechuanaland and Matabeleland,—thus getting the allied Dutch republics surrounded on all sides by British territory, excepting on the side of the Portuguese coast strip. Furthermore, it was not unreasonable to believe that in the long run it might well be a better thing for the population of the Dutch republics to be federated with British South Africa, and to come under the general sway of the British Empire,—which, for self-governing colonies, has hitherto meant protection and help, without any sacrifice whatever of real freedom, to live their own lives and to develop in their own way.

*A Raid and Its Consequences.* There were no conditions existing in South Africa that even in the smallest degree justified the resort to arms on either side, prior to the Jameson raid. If that raid had not occurred, there would have been no subsequent Boer war. Even a different treatment of the raid after it had occurred, by the British Government and by press and public opinion in England, might have reassured the Boers and averted the great conflict. But the Boers became profoundly convinced that the British Government was, in reality, implicated in a plot to steal their country, and so they began importing munitions of war on a large scale and preparing to defend themselves. In due time the diplomatic methods of Chamberlain and Milner took on a form that the Boers fully believed was intended to have no other effect except to provoke a quarrel that would give England the opportunity to make open conquest where she had failed in the Jameson episode. The future

historian is likely to draw a curious and, in some respects, a significant parallel between the Jameson raid and the John Brown raid upon Harper's Ferry. John Brown's lawless action, together with the ill-considered praise that it evoked throughout the North, probably did more than all other incidents put together to deepen sectional misunderstanding, to inflame passion, and so to provoke secession and war, where, in a critical period, the things supremely needed were calmness, patience, toleration, and some little sense of the value of time as a factor in the working out of all national and historical problems.

*What Was the  
True British  
Motive?*

The Jameson raid was avowedly for the relief and aid of the Uitlanders in Johannesburg and vicinity, whose grievances under Boer rule were being exploited so successfully by a combination of capitalists and politicians. With their fast-growing numbers, their superior wealth, and their cleverness and intelligence, the Uitlanders would, within a very short time, have had everything their own way, without interference on the part of England or any other foreign country. Probably the thing really feared by the imperialist politicians like Rhodes, Chamberlain, Milner, and others was that the Uitlanders, in due time, might supersede the Dutch as the controlling element in the Transvaal Republic, and then might be even more opposed than the Boers themselves to having their little country painted British red on the map of South Africa. When the underlying facts come to be known, it may well turn out that both the Jameson raid, and the subsequent provocation of war under pretense of concern about the Uitlanders, were due more than anything else to the British realization of the fact that Germans, Frenchmen, Americans, and men of all nationalities were flocking to Johannesburg, and were by no means certain to favor the ultimate acquisition of the country by Great Britain.

*The New Boer  
Nation,—A  
Paradox.*

However that may be, the question is now one of merely academic interest. The Boers have accepted British sovereignty in good faith, and the British have conceived an almost exaggerated respect and admiration for the character of the Boers, whom they frankly despised at the beginning of the war. There is one remarkable historical paradox to be noted in the outcome of this lamentable struggle. In the loss of their beloved independence, in the defeat of their cause, and in their seeming extinction or absorption, the Boers have really come into a new birth as a nationality. It is not written that a young people capable of such heroism shall, after practically dictating

terms to the greatest empire in the world, permit themselves to forget that they have had a great part in the making of history. This is not a day when small nationalities are assimilated and yield up their identity; and so, far from this being the end of the Boer nation, the Peace of Pretoria is the beginning of it. These Boer farmers were the most obscure people of European stock in the whole world. They were far less known than the Icelanders. To-day they are passionately admired throughout every nook and corner of the civilized world.

*Terms of  
Settlement.*

The Boer leaders were well aware, more than a year ago, that political independence, in the sense of sovereign membership in the family of nations, was an impossibility, and they were ready to come to terms with Great Britain on a basis which, while making them part of the empire, should give them colonial home rule, with assistance in restoring their devastated country, and with clemency, if not full amnesty, for the Cape Colony Dutch, who had joined their Transvaal and Orange Free State brethren in the war. Lord Kitchener, who was fighting the campaign, and should have had something to say about the terms of peace, would readily enough have ended the war more than a year ago. But Milner and Chamberlain, sustained by Lord Salisbury, insisted upon unconditional surrender, with the literal enforcement of their proclamation of perpetual banishment of

"Brave minds, how'er at war, are secret friends,  
Their generous discord with the battle ends:  
In peace they wonder whence dissensions rose,  
And ask how souls so like could e'er be foes."

From the *Ohio State Journal* (Columbus).

Boer leaders from South Africa, and with the enforcement against all Cape Colony Dutchmen who took up arms of the penalties for high treason. The Boers refused to modify their conditions, fought steadily on, and, in the end, conquered practically every point that they had held out upon, and seemingly somewhat more besides.

*Vital Points  
Gained by  
the Boers.*

The great point for which they had chivalrously fought on was that of clemency toward the men of Cape Colony who had forsworn their British allegiance and joined the Boers. This point was completely won; for the loss of the right to go to the polls on election day is a very small matter to a man who had expected to have all his property confiscated, and to be either shot or hung himself as a traitor. As to banishment of Boer leaders, the British were compelled to withdraw their proclamation and recant completely; and, further, to promise to bring back promptly and at their own expense the many thousands of Boer prisoners, both officers and privates, whom they had sequestered in Ceylon, St. Helena, Bermuda, and to some extent elsewhere. Further than that, the British agreed to pay the Boers outright a cash indemnity of \$15,000,000, to be used for the restoration of the building and stock of the devastated farms of the Transvaal and the Orange Free State. To make sure that the British themselves should really pay this money, it was stipulated that no part of this sum, or of the British war outlay, should be levied in the form of taxes upon Boer lands or property.

*A Remarkable  
Bargain.*

Furthermore, the British agreed, in addition to the \$15,000,000, to advance large sums of money free of interest, if needed by the Boers, to buy stock and replenish their farms and herds. As to government, the Boers were accorded full amnesty and full political rights, with the promise, at the earliest possible day, of self-governing institutions for the Orange River Colony and the Transvaal, and with just as good a status as the Australian or the Canadian enjoys. Thus there could not possibly have been a greater contrast than that between the public assertions of Lord Salisbury and the leaders of the British Government, more than a year ago, as to the terms to be accorded to the Boers, and that which has actually taken place. The stipulations even go so far as to give validity and protection to the debt incurred by the Boers in carrying on their war. It is true that the Boers have lost a separate international position; but that is something that they never had really grown into, or exercised, in any important sense. It was hard for them to yield

LORD KITCHENER, THE ONLY ENGLISHMAN WHO HAS GAINED MUCH REPUTATION IN THE SOUTH AFRICAN WAR.

this theoretical point; but since they had to do it, they made a most remarkable bargain for themselves, and demonstrated statesmanlike qualities equal to the amazing military prowess the world had already recognized.

*The Develop-  
ment of a  
Race.*

The great West and the new South in this country, after the Civil War, were created by the thousands of young men whose energies had been developed and whose powers of achievement and leadership had been discovered and trained through the emergencies of the conflict. Certainly, one of the most important effects of the South African war will, before long, come to be recognized in the marvelous personal transformation of thousands of Boer farmers and their sons, through the experience of heroic participation in so great a war against an enemy so highly civilized and so humane, as well as so brave and, upon the whole, so untiring and effective. This war has brought the Boer people from the primitive conditions of eighteenth-century peasants to the realization of many of the strenuous conditions of life in the twentieth century. It is true they had a scanty population, and could ill afford to lose the men who perished in battle and camp, while still less could they afford to lose the scores

GEN. CHRISTIAN DE WET, NOW A GREAT CITIZEN OF BRITISH SOUTH AFRICA.

(A dispatch of June 19, from Bloemfontein, reports that General De Wet has addressed a circular letter to his adjutants, in which he says:

"Let me tell you that you and I and every burgher can win the heart of the new government by our future conduct, and of this conduct I am not in the least doubtful.")

of thousands of little children who perished through the starvation and disease consequent upon the burning of farm buildings and the sweeping destruction of crops and cattle. But the Boers are an extraordinarily prolific race, and they have been by no means decimated by the war.

The bringing back of the Boer prisoners, and the restocking of the farms through British aid, render it as certain as anything in the future that the Boer race

will experience a great revival in numbers, in wealth, in ambition, in influence, and in power; and that it will supply the hardy racial stock that must be relied upon for the pioneer work of redeeming for civilization the stubborn wilderness of South Africa. All this is perfectly compatible with their remaining in the British Empire for an indefinite period, and with no small degree of contentment. But for the rude awakening of this war, they might, through sheer backwardness, ignorance, and sluggishness as a race, have lost their language and merged their identity. But this experience will have made them one of the self-conscious and assertive races. It is important to remember that they stipulated for the right to use their own language in schools, courts, and government proceedings. This, also, from their point of view, is a vital consideration. Hardly less vital, in the Boer estimation, is the victory in the matter of the political status of the native population, consisting principally of negroes of the Kaffir stock. The English disposition was to enfranchise the Kaffirs,—who had been on their side in the war,—partly in deference to a sentiment of human equality, but principally in order to use them as a political makeweight against the Dutch in the future politics of the Transvaal as a self-governing colony.

*White Boer  
vs. Black  
Kaffir.*

The South African Dutch, however, have always been most tenaciously opposed to the admission of the native black races to political privilege, and the British completely yielded the point; that is to say, they agreed to leave it as a colonial question, to be dealt with, or not dealt with, by the white voters of the Transvaal when civil order is fully restored and local self-government goes into effect. In this country, at the close of the war, the North en-

bised the Southern negroes, and made the tance of their full political status a condi- of the restoration of the States. In South a, on the contrary, the English victors were d to agree in advance that they would do ng resembling the enfranchisement of the vaal negroes, but would leave the question dealt with locally. Of course, it need not plained that slavery would be illegal and isible under British sovereignty.

The Uitlander element of Johannes- burg and that region will, of course, have full political privileges, without , in so far as it is made up of British sub- Americans, Germans, and Frenchmen rring to keep their allegiance will have y such protection and such rights and privi- as they enjoy anywhere else under the h flag. For the development of industrial tions in South Africa, including the mining ess, the new conditions will be far better, less, than the old. Thus, if the state of s that will come into existence by virtue of rms and stipulations contained in the agree- of peace could only have been brought without war, it would have been a good gement for everybody immediately con- d, and an advantageous one indirectly for orld at large.

While it is true enough, as a matter of historical record, that the Boers won the honors in the war, and pre- d the conditions of peace, it is none the less hat there is nothing in any of the conditions s either detrimental to British interests, or y manner humiliating either to British arms tesmanship. If the Boers had surrendered ditionally, it would still have been good manship for England to grant them, of her free will, all the benefits and immunities were secured by the treaty of Pretoria; for ost difficult conquest of all is that of men's s and hearts. Thus, if the British had ended the war at the time when they pro- ed it at an end,—which was in the early nn of 1900, more than a year and a half —there would have remained the necessity eeping the whole country garrisoned with s, and England would have had on her hands anentely, not merely an Ireland in South a, but something much worse. As matters l, large garrisons will not be needed in any of South Africa. The fighting Boers have ully presented themselves and made their mission, and taken the oath of allegiance. English have fortunately learned to respect

the Boers, and, on the other hand, the bitterness and antipathy of the Boers toward the English has spent itself in the long struggle. The war has brought to the forefront the men who are the natural leaders of South Africa, and to these men the British Government should frankly in-

GENERAL DELAREY.—A GREAT LEADER, AND A SPLENDID ADDITION TO THE RESOURCES OF THE BRITISH EMPIRE.

trust the direction of South African affairs. Mr. Steyn, the late president of the Orange Free State, is one of the ablest men of our generation, and he is only one of a splendid group of men of vigor, character, intellect, and tenacity. The British Empire will make a great mistake if it does not, without much delay, frankly avail itself of the services of these men, whose heroic support of the cause to which they were pledged shows their capacity for patriotism, and demonstrates their right to remain the local leaders of the land which has produced them.

*A Hard Lesson  
for "Ruling"  
Races.*

It is extremely hard for a nation holding the reins of superior authority to know how to treat another nationality with breadth of wisdom and with essential justice. England lost her North American colonies

through that fatal temptation, always begotten of power, to deal in an arbitrary way with questions as they arise. The alienation of Ireland,—so costly and so humiliating to England,—grows out of a stubborn unwillingness to let the Irish manage their own affairs,—an unwillingness which amounts to something like an incurable mental or moral malady. This useless war against a few farmers in South Africa,—which is perhaps the biggest war that England has ever waged in her history,—was wholly without cause, and altogether provoked by an arbitrary and tyrannical attitude. The Boers were ready to allow any and all points of difference to be settled by friendly arbitrators, and would have been willing enough to let fair-minded Englishmen themselves sit as sole members of the tribunal. It is not the English alone who do not grasp sound principles in dealing with peoples that come more or less under their control. Russia is weakening herself, as well as doing a moral wrong, by refusing to allow Finland to go on in its own happy, contented way. The Germans are only sowing the seeds of future trouble for themselves by their treatment of the Poles in East Prussia.

*Our Own Experiences.*

A monumental instance is our own reconstruction policy after the great war, when we committed the almost irreparable mistake of depriving the responsible Southern population of the conduct and control of its own affairs. The Philippine instance is not a parallel one, although many people in this country believe it to be. Nevertheless, in our dealing with the Philippine situation, it is probable that at certain points and moments a good deal more exercise of tact in the treatment of individual Filipino leaders might have lifted some of the burden that our army has been compelled to bear, through so much hardship, and with so much of patience and humanity, under great provocation. Here, of course, many questions of exact fact are involved, and it is not well to jump to conclusions. The Filipinos differ from the other peoples to whom we have been alluding in the fact that they are not a homogeneous people, with institutions of their own, with a history, a language, a literature, or a type of political life or organization. At much expense to ourselves, we are making a people of them, and instructing them in the principles and art of government all along the line, from the local township up to the general government of the archipelago. They will gradually come to understand this, and at no distant future they will be happy, prosperous, and contented beyond most regions of the earth. In the end they must be free to be their own rulers. But first they must become a political entity.

*Providing Philippine Government.*

Acting-Governor Luke Wright reported last month that there was no fighting going on in any part of the Philippines, and that all portions of the archipelago were ready for organized civil government,—excepting, of course, the islands and districts occupied by the Mohammedan Moros, who will for a long time keep the tribal organization and semi-independent life that they have always lived. The long Philippine debate in the Senate at Washington came to an end early in June, when the pending bill was passed by a vote of 48 to 30, all the Democrats voting against it, Senator Hoar and Senator Mason also voting in opposition. The bill, as explained heretofore in these pages, gives specific legislative authority for the work of civil government carried on by Governor Taft and the Commission, and provides in great detail for many matters that needed immediate action, such as land titles, the granting of franchises, mining permits, and the like. The Senate bill differs from the House bill in that it does not undertake to provide for the establishment of a Philippine legislative assembly, but only goes so far as to arrange for a census and the collection of various data as a preliminary basis for a future representative government. The Senate bill maintains a silver standard for the Philippines, while the House bill provides a gold standard. Various points of difference between the two bills will, of course, have found adjustment at the hands of conference committees.

*Making a Party Issue.*

The protracted debate was marked by a persistent and elaborate attack upon the conduct of the army in the Philippines, with the result of establishing the fact that no army in the history of the world has ever made so good a record under comparable circumstances. The Democrats in Congress, and also in various States, as shown in a number of platforms adopted in State conventions for use in the campaign of the present season, have agreed that they will make the Philippine question a distinct party issue. Their doctrine is that we should treat the Philippines as we have treated Cuba. They rest their case upon the pure assumption that there exists a political entity that they call the Filipino people, or the Filipino nation, as a distinct population recognizing its own racial identity, its kinship of aims and aspirations as well as of blood, and possessing a national patriotism, along with a clear and great ambition to become an independent member of the family of nations. Senator Hoar's great and eloquent speech, masterly as an exercise in rhetoric, and most beautiful and exemplary in its manner and tone, was all de-

veloped by a process of purely abstract, *a priori* reasoning. To be sure, it was adorned with many allusions to fact and references to history. But its structure was wholly abstract; and if its premises were at fault, it was a beautiful speech, a dialectic exercise, and nothing else.

HON. GEO. F. HOAR, OF MASSACHUSETTS, THE SENATE'S FOREMOST ORATOR.

Mr. Hoar says that we have been fighting in the Philippines for dominion, and that the Filipinos have been fighting for liberty and for the establishment of an independent republic, and that our "practical statesmanship has succeeded in converting a people into sullen and irreconcilable enemies, possessed of a hatred which centuries cannot eradicate." But the facts are that the Filipinos are not fighting for a republic. Practically all those who are fighting at all are bandits. The intelligent Filipinos, far from being sullen and irreconcilable enemies, are fast becoming enthusiastic in their affection for Governor Taft, and in their appreciation of the splendid spirit of justice, intelligence, and humanity that pervades his entire administration. The best way on earth,—in fact, the only way,—to make a republic at some time in the future out of the Filipinos is to do exactly as we have been and are doing,—namely, first, restore peace and order so that the plain man may live and work in security; and, second, create institutions of government just as fast as possible. In the ordinary Filipino community to-day there is no American at all except the school teacher, and the work he

is doing commands the ardent admiration of the Filipinos, who are begging us to send ten times as many American teachers, and to pay them twice as much, so that good ones may volunteer, and may feel justified in staying.

*The Real Situation.* Under Spanish administration, which is all the Filipinos have ever known anything about, the natives were robbed with or without pretense of taxation, denied ordinary justice, and maltreated in a thousand ways. All those abuses have disappeared. Even at this moment the sensible Filipino has no more desire to have the United States Government leave the archipelago than the sensible Egyptian peasant of the Nile valley desires to have the British withdraw from Egypt. Everything that makes life worth living to the Egyptian fellaheen has come through the British occupation. The American occupation of the Philippines is even more necessary and more desirable, because the conditions of the people are more arduous, and their ability of themselves to remedy those conditions is even smaller than was that of the Egyptian peasantry. There are not, probably, a thousand people out of the ten million native inhabitants of the Philippine Islands who are so lacking in practical sense and judgment as to attach at this moment the importance that Senator Hoar supposes they attach to a thing that every unbiased outside observer would declare to be both impossible and undesirable,—namely, the exercise of independent sovereignty by the inhabitants of a group of islands who are not yet welded into a nationality, who have no common language, and who have no background of history.

*The Land and the Friars.* There are Americans who oppose our being in the Philippines on the perfectly understandable argument that we are not called upon to make such altruistic sacrifices. Those men are able to see that we are doing a marvelous work for the Filipinos; but they are not able to see that we are getting any commensurate benefit, either present or prospective, for ourselves. When Senator Hoar and the other "antis" talk about "sullen and irreconcilable enemies, whose hatred cannot be eradicated in centuries," they are talking of a situation that is changing so steadily and so visibly that it would be safer to say months, or even weeks, than hundreds of years. The practical question of the friars and their lands is a hundred times more interesting to the Filipinos than Mr. Hoar's question of abstract sovereignty. Last month Judge Taft visited Rome, with full instructions to negotiate, on a business basis, at

CARDINAL RAMPOLLA.

he Vatican, for the purchase of the agricultural lands held by the religious orders, and for the withdrawal of the deeply-hated friars from the ecclesiastical and civil life of the Philippine islands. The Pope received Judge Taft with every mark of consideration, and a committee of five cardinals,—composed of Cardinal Rampolla, papal secretary of state, and Cardinals Vives y Cuto, Steinhuber, Gotti, and Vannutelli,—was immediately appointed to join the American reputation in working out the details of an agreement. It promptly became known that Judge Taft's errand would be entirely successful, and that the land would be acquired by the Government, at a fair price to the ecclesiastical holders of the title, so that it could be made over on suitable terms to the native farmers who have heretofore tilled it as tenants.

*Substance  
Rather than  
Shadow.*

The question of land titles in general has been given careful consideration, and in all such practical matters the truest spirit of justice to the people prevails, and the very best intelligence, native as well as American, has been brought to bear upon the solution of questions as they have come up. These are the real services that make people happy and contented; and it is precisely because of the existence and retention in those islands of

American sovereignty that these matters can be adjusted and the way paved for Philippine progress. With the going into effect of the civil government act, the establishment of a good monetary system, and the granting of franchises so that railroads can be built and many other enterprises undertaken, the Philippines will enter upon a new era of prosperity. Our great orators like Senator Hoar will, within five years, be the eulogists of a transforming colonial policy which, for brilliancy of achievement in the Philippine Islands, must challenge comparison with anything ever done by any nation. Those who opposed our intervention in Cuba now praise it to the skies, and they will have another clearing of vision some day. As to the recent work of the army on the side of its show of force, it is not war but vigilant policing. It is the breaking up of the brigandage that is always apt to follow the last stages of guerrilla fighting. Brigandage has to be faced and put down, whether in the Philippines, or in Mexico, Spain, Italy, or Bulgaria. As a matter of practical policy, we are doubtless very near to the day when it will be wise to enlist Filipinos to a large extent in the army, and to intrust principally to them the work of subduing the marauding bands who, under pretense of patriotism, are really nothing but outlaws. It is intimated that a general amnesty proclamation may be issued as early as the fourth of the present month of July. One of the results of such a proclamation would be the immediate return of the Filipino prisoners who are at present detained on the island of Guam. Señor Llorente, who was Supreme Court Judge under General Otis' administration, and afterward governor of Cebu, has been made Governor of Samar, and will establish there a civil government on the scene of the recent disturbances.

*Cuba and the  
Special Mes-  
sage.*

The depressed business condition of Cuba, and the discouraging outlook in the Senate at Washington for the passage of the Cuban reciprocity bill, led to the sending of a special message to Congress by President Roosevelt on June 13. In this message the President re-stated his well-known views, and urged Congress to come to Cuba's relief. A group of eighteen Republican Senators had joined the beet-sugar movement against reciprocity, and thus the situation had become very dubious. From the President's standpoint, the question at issue is not primarily an economic one, but one of public honor and good faith. Under the limitations imposed by the Platt amendment, Cuba is not, in the full sense, a foreign country, but is an American dependency.

Under these circumstances, it would seem only reasonable to give Cuba some advantages as compared with foreign nations in the American market. From the strictly economic point of view, the reciprocity bargain would be an excellent one for us, because the Cuban market would be beneficial to many lines of American production and industry, while the concessions granted by us in return would hurt none of our industries, and would cost us nothing appreciable. The remission in favor of the Cubans of a portion of the tariff on their sugar crop would benefit them, without affecting by a single cent the price that any Western producer would obtain for his sugar-beets, or any Louisianian for his cane.

*The Fallacy of the Beet-Sugar Argument.* It is plain that there is a good argument, from the standpoint of the American sugar producer, against a general lowering of the tariff on sugar. But it is equally plain that a reduced rate on the Cuban crop alone could not affect the level of sugar prices in the United States. The home producer, who declares that he wants the benefit of the tariff, has to-day exactly the same degree of effective protection that he had before we admitted Porto Rican sugar free of duty. And he would have neither more nor less tariff protection remaining to him, whether one policy or another should be adopted in respect to Cuba. The men who have been telling him things contrary to this have been either ignorant themselves, or else have been guilty of confusing his mind intentionally. The remission of 20 per cent. of the duty upon the Cuban crop alone would have exactly the same effect as the admission, free of duty, of one-fifth of the Cuban sugar crop, while charging full duty rates upon the other four-fifths. And this admission, free of duty, of one-fifth of the Cuban sugar crop would affect the beet-sugar producers of the United States neither more nor less unfavorably than the addition to our home sugar crop of an equivalent quantity. In other words, the effect of a 20 per cent. reduction upon the Cuban tariff would be simply that of the addition of, say, 100,000 tons to the domestic sugar crop, out of a total consumption of considerably more than 2,000,000 tons.

*How Prices Are Fixed.* The merest schoolboy knows that the American price is fixed by the deficit that we have to import at the full duty rate. Even if we admitted the whole of the Cuban crop free of duty, instead of only one-fifth of it, as is proposed, the American beet-sugar producer would not be affected at all, because we should still have to import from other countries

SENATOR BURROWS, OF MICHIGAN.

(Who led the Republican group of Senators that opposed the policy of Cuban reciprocity.)

about 1,000,000 tons, or half our total consumption, at full tariff rates, and this, of course, would maintain the price. The average American citizen, from his standpoint as a sugar consumer, has nothing at stake whatever in the controversy that has been pending. He will continue to pay for the sugar he uses the price prevailing in the world markets,—as in England, for instance,—plus some charge for transportation, and plus the full rate of the Dingley tariff. It might, however, make some difference to a man engaged in the sugar-refining business where his factories are located. The Western farmer had been so carefully hoodwinked that he did not for a time see that the extra profit due to the tariff does not go into his pocket, but into that of the owner of the beet-sugar factory. But his eyes are opening.

*Is Annexation the Game?* The present economic position of Cuba is about as forlorn as Florida's would be if Florida were a separate republic, without separate trade relations with the United States. If Congress refuses to give Cuba special tariff treatment, it follows inevitably that Cuba must seek admission as a State, and we should not be justified in refusing to admit her. It is possible, indeed, that this is what the lobbies are really driving at. It is obvious that the great sugar refineries situated on the Atlantic seaboard might be expected to have some interest in the progress and development of the cane-sugar industry of the West Indies, from which

they derive their supplies of raw material. Thus, a policy at Washington that would precipitate the annexation of Cuba might, in the end, prove considerably to the advantage of the so-called American "sugar trust." Undoubtedly, the behavior of the gentlemen acting ostensibly against the sugar trust, and in the interest of the beet-sugar producers, has been the one and only thing that has revived the talk of annexation, and made it possible if not probable. The men who own the principal beet sugar factories of the West, and who have been supposed at Washington to represent the farmers, do, as a matter of fact, represent Eastern capital. What motive lies behind their conduct, unless it be that of producing distraction and despair in Cuba, in order that they may buy the sugar lands at reduced prices, and then bring about annexation, to their own vast enrichment?

American farmers from a few States, chiefly new ones, have been duped into bringing pressure upon their representatives at Washington; and these representatives have presented no argument, and given no reason, for their position,—except that they have discovered a sentiment in their States against doing anything for Cuba. This sentiment at home has, in its turn, been produced by active and persistent scheming, which began, two or three years ago, in preparation for the present situation. Meanwhile, if the plotters have intended to bring financial ruin upon Cuba, they must have felt last month that their cause was making headway. Authentic reports from the island were marked by deep gloom and anxiety. General Wood's administration had done splendid things, but had spent money freely to accomplish them. President Palma was expected to maintain the high standard throughout, yet saw no way to provide sufficient public revenue to keep the work up to the mark set under the American occupation. The situation was altogether a painful and a cruel one, whether viewed from the public or the private standpoint. The people of the United States have intended to deal justly by Cuba, and the men of those parts of the West who have been so determined to prevent Cuban reciprocity have simply been misled as to the facts and conditions.

*The Senate and the Isthmian Canal.* At the conclusion of the Senate's debate on the Philippine question, in the first week of June, the debate on the Isthmian Canal was opened with an agreement that it should continue for two weeks,—that is, until June 19, when a vote should be taken. Senator Morgan, chairman of the Inter-oceanic

Canal Committee, opened with a speech in support of the Nicaragua route. On the following day, Senator Hanna spoke in favor of what was known as the Spooner substitute for the Hepburn bill. It will be remembered that the House, with almost absolute unanimity, had voted to adopt the Nicaragua route, and had instructed the President to proceed with the work. The Spooner substitute in the Senate proposed the adoption of the Panama route, provided the President, on due investigation, should find that the French company, which was proposing to sell its assets to us for \$40,000,000, could deliver the property with a clear title. The Isthmian Canal Commission had preferred the Panama route, but had at first recommended the other, chiefly because of the large price asked by the French company for its claims. It took the ground, in its original report, that the work already done at Panama would not be worth more than \$40,000,000 to a builder who should undertake to complete the canal. Thereupon, the French company promptly reduced its price from more than a hundred millions to forty millions, and the Commission, upon being reassembled, made a supplementary report, recommending the Panama route, if acquired under the reduced terms.

The Nicaragua route would be much nearer to the United States than the other, and would be feasible for sailing vessels, whereas the prevailing calms would interfere with their use of a canal at Panama. Upon the other hand, the Nicaragua Canal would

UNCLE SAM: "I could be happy with either were t'other fair charmer away."

From the Ohio State Journal (Columbus).

be 183 miles long, and the Panama only 49. If the Nicaragua route should finally be defeated, it may, perhaps, be said that the scale was turned by the recent terrible eruption of volcanoes in the West Indies. More than once, in years past and gone, arguments have been made against the Nicaragua route on the ground of its lying in a dangerously volcanic region. But the argument made no impression on the public mind until Senator Hanna advanced it again, with great maps and charts, in the Senate chamber, while Mont Pelée and La Soufrière were still in active eruption, and the newspapers were full of the terrors of volcanoes and earthquakes. The Senate on the 19th voted for Panama by a decisive majority. The question was at once taken up again in the House, with no certainty as to results, but a chance of concurrence on Panama.

*Popular  
Opinion in  
Suspense.*

The people of the United States are strongly committed to the policy of an inter-oceanic canal owned and controlled by the United States Government. For many reasons of an historical and more or less sentimental nature, they would have preferred the Nicaragua route. They have been abundantly justified in viewing the French project of selling out to the United States with suspicion and distrust. If, therefore, the Panama route should win in the end, it must be on its sheer merits and in spite of the plea that our Government should not have involved itself in any negotiations with a private European company, but should have dealt solely and directly with the Government of Colombia, securing an outright acquisition of the Isthmian route, including full sovereignty over the whole or a part of the Colombian State of Panama. On its face, the French charter had already been forfeited, and the circumstances of its alleged extension were said to be irregular. If, however, the physical conditions render the Panama route decidedly preferable, the tangle regarding rights,

SENATOR JOHN C. SPOONER, OF WISCONSIN.

(Who has been more prominently identified with the leading subjects of legislation in the Senate, during this session, than any other man.)

claims, and franchises can, of course, be straightened out. There is no reason to think that any man with a particle of influence in either House of Congress, or in our executive government, is placing himself in a suspicious attitude by favoring the Panama route, any more than there is reason to suppose that the geologists have been bribed to invent stories about Nicaragua volcanoes. President Roosevelt will not buy out the French company in case of the adoption of the Spooner substitute until all doubts and difficulties of a legal and diplomatic nature have been completely cleared away. Although the House voted for the Nicaragua route, its vote was intended, not so much to settle the route question finally as to show its disposition to have an interoceanic canal built by the Government without further delay.

## THE PRESIDENT AT THE WEST POINT CENTENNIAL.

*Matters Affecting Army and Navy.* A great event of the past month was the celebration at West Point of the hundredth anniversary of the founding of the Military Academy. The ceremonies were impressive, and the speeches were of a high order of merit and interest. Gen. Horace Porter, our ambassador at Paris, was the chief orator, but the President and the Secretary of War made eloquent and memorable addresses, and General Schofield and General Alexander,—the latter a distinguished Confederate veteran,—spoke wisely and impressively. We publish elsewhere an article on West Point and the celebration from the pen of Colonel Tillman, one of the professors in the academy. The celebration was rendered the more enthusiastic by an action of Congress which had made certain an appropriation of about \$6,000,000 for the much-needed pro-

vision of new buildings for the academy. The United States army is now in a state of the highest efficiency. By a recent order issued at the War Department the total army strength will be cut down from (in round figures) 77,000 men, as at present, to 66,000. It will be organized on the plan of keeping about one-third of it in the Philippines, with such shifting of men and regiments as to equalize Philippine service. Heretofore promotions in the navy have been made by seniority, while in the army they have been made by selection. It is understood that President Roosevelt and Secretary Moody have decided to apply the army system to the navy, at least to some extent. The Senate did not agree to the provision in the House naval bill requiring that one-half of the new vessels authorized should be built in government yards. The naval bill, as passed by the Senate, appropriated an amount exceeding \$78,000,000. Both Houses agreed in ordering two new battleships, two new cruisers, and two new gunboats, but the Senate also added an order for five submarine torpedo boats. The

Senate also recommended an increase in the number of cadets at the Naval Academy at Annapolis by ninety-five, and an appropriation was made for another new building at Annapolis. Much interest in naval circles has been manifested in the plans for a great series of naval maneuvers on a scale never before undertaken by the United States.

*The River and Harbor Act.* One excuse urged for the passage of an unprecedented appropriation for the improvement of rivers and harbors was that no river and harbor bill was passed by Congress last year. But under the system now in vogue, of authorizing contracts for the future completion of work, a good many millions are paid out every year in the Sundry Civil bill, to continue work on improvements ordered by

river and harbor bills of former years. The new bill dwarfs anything of the kind in our history. It amounted to \$60,000,000 when it left the House; the Senate added \$10,000,000, and the conference committee split the difference. Thus it carries a total appropriation, in round figures, of \$65,000,000. Of this amount something under \$30,000,000 will be paid out of the Treasury next year, and the payment of the remainder will be distributed through several years, as called for by the improvement contracts. To put it mildly and cautiously, this measure is not defensible as meritorious legislation. Congress made confession of the impropriety of the methods by which such vast raids on the Treasury are organized, by putting in this very bill a clause providing that there shall be created a permanent board of engineer officers, to pass henceforth upon all proposed river and harbor improvements.

*Another Log-Rolling Affair.* This union of local interests for a grand raid upon the United States

Treasury can be applied to other objects besides the improvement of rivers and harbors. Thus the method has been successfully adopted this year by nearly two hundred cities, towns, and villages, which, being ambitious to have the United States build for them pretentious public structures, pooled their issues and forced through Congress the so-called "Omnibus Public Buildings Bill." As passed, it makes a net demand on the Treasury for about \$20,000,000,—petty villages in some cases securing large sums for wholly unnecessary federal buildings. Such a combination, of course, is almost impossible to beat. The country, as well as local interests, imperatively needs large expenditure for improved postal facilities in New York City, and appropriations were duly made for New York in the new measure. But the bill was so skilfully constructed on the united-we-stand-divided-we-fall principle that the group of New York Congressmen, in order to secure a meritorious and necessary appropriation, were obliged to vote for a bill which, in many of its details, was an outrageous imposition upon the taxpayers of the United States. Here again Congress needs to provide a way by which to protect the country against a vicious application of the log-rolling principle in a new direction. Of course, many of the items in the river and harbor bill, and many of those in the omnibus buildings bill as well, were meritorious.

*An "Omnibus" Statehood Bill.* Another "omnibus" bill, though on a more limited scale, is that which proposes the immediate admission of Oklahoma, New Mexico, and Arizona as States

in the Union. This bill passed the House of Representatives on May 9. If the admission of these States meant nothing to the Union except four members in the House of Representatives (Oklahoma would be entitled to two, while the others would have one apiece), there would be no very serious objection to the statehood bill. But it is a wholly different matter to add six more members to the United States Senate from States of scanty population. The objection is not theoretical only, but practical. For example, if the people of the United States had been proportionately represented in the Senate last month, there would have been no difficulty at all about securing justice for Cuba. A number of the eighteen or nineteen Senators who refused absolutely to act with the President, and with the majority of the prominent and influential Senators of their own party, were men from comparatively small States. Thus, if representation in the Senate were according to population, New York, as compared with Nevada, ought to have four hundred Senators, for New York has two hundred times as many inhabitants as Nevada. Yet, in this contest over a great issue that involves the public honor, Nevada exactly counterbalances New York in the Senate. If Senator Mason of Illinois is omitted, the remaining eighteen Republican Senators who refused to act with their colleagues represent, in the aggregate, about as many people as the inhabitants of the one State of New York.

*Reasons Against Admission.*

The grotesque inequality of representation in the Senate has come to be one of the most serious practical difficulties with which our American political system has to contend. To admit just now three more States of small population would be to make a bad matter worse. By the last census Oklahoma had not quite 400,000 people, New Mexico had 195,000, and Arizona had less than 123,000. Oklahoma is certainly developing rapidly, but its present boundary lines are not satisfactory. With the addition of the Indian Territory, it would have an area about equal to that of Missouri, Wisconsin, or North Dakota, and it would even then be a good deal smaller than many other of the States. It would be both absurd and scandalous to admit Oklahoma with its present boundaries. It is true that Arizona and New Mexico have large areas, but most of their land is mountainous or desert waste; and even if united into one State, their territory would be considerably smaller than that of Texas. The Republican members of the Senate Committee on Territories,—of which Mr. Beveridge, of Indiana, is chairman,—voted last month not to consider the omnibus statehood bill at the

present session, the Democratic members of the committee favoring immediate consideration. Senator Quay, of Pennsylvania, however,—for reasons which, correctly or incorrectly, have been assigned by the newspapers as personal and private rather than public,—undertook to take the subject out of the committee's hands and force action upon it. Although the Democrats regard themselves as normally stronger than their opponents in all three of the Territories in question, the parties have been so evenly divided in recent elections that the question of political advantage to either organization need not enter into the discussion.

Although not widely understood in the East, the irrigation bill, as successfully carried through both Houses and signed by President Roosevelt on June 18, is one of the most far-reaching and fundamentally important measures enacted at Washington in recent years. It required steady persistence and effort to formulate a general irrigation scheme, and then secure for it the approbation of Congress. But this sort of union of effort on the part of many localities is upon a very different plane from that which results in river and harbor bills or omnibus building raids on the Treasury. Mr. Newlands, of Nevada, one of its most prominent advocates, predicts that under the provisions of this bill at least \$150,000,000 of the proceeds of the public lands will be available in the next thirty years for irrigation works without further appropriation. This measure will, of course, in the long run, greatly increase the prosperity and add to the population of the arid regions of the West. Under the system provided, the receipts from the sale of United States Government lands, amounting lately to an average of about \$3,000,000 a year, will be used to provide works for the irrigation of lands which, in turn, will be sold at an enhanced price, and the proceeds added to the irrigation fund. It is believed that on this plan the fund will gradually swell and make financially possible increasingly large projects for the watering and reclamation of desert lands. It is a fascinating idea.

*Against Assassins and Anarchists.* The general sentiment in favor of measures against the anarchists, and for the better protection of high officials, growing out of the assassination of President McKinley, has not resulted in the stringent enactments that were expected a few months ago. The Senate, in March, passed a bill the principal object of which was the better protection of the President, but at that time it declined to deal in the same measure with the general question of

HON. FRANCIS G. NEWLANDS, OF NEVADA.

(Member of the House Committee on Irrigation of Arid Lands.)

restraining the anarchists. Various bills relating to that topic were held in reserve by the Judiciary Committee, where they have slumbered ever since. The House, on June 9, passed a substitute for the Senate's bill to protect the President, and in the same measure added certain sections that will have considerable interest for our anarchist brethren. It is likely that before the session ends the two Houses will have come together on some measure. Both Senate and House have voted to make the intentional killing of the President or Vice-President, or any officer entitled by law to succeed to the Presidency, punishable by death. To attempt to kill the President or any of these officials, or to threaten to do so, or to advise or counsel anybody else to do so, is made punishable by a term of imprisonment in both bills. The House bill extends similar protection to foreign ambassadors or ministers accredited to this country. The Senate bill provides for the punishment of those who conspire against the sovereign of a foreign country, and the House bill deals separately with the same matter, but more specifically. The House bill has sections which provide against the admission into the United States of any person who "is opposed to all organized government, or is a member of any organization entertaining or teaching such opposition." It also prohibits the naturalization of anarchists, and gives the judges

authority to investigate before issuing naturalization papers. The exclusion of anarchist immigrants is also specifically provided for in an important general immigration bill passed by the House several weeks ago. This measure undertakes to unify and consolidate all existing laws on the subject of immigration, and makes a good many changes of detail, especially with the view to a more efficient enforcement of such restrictions as already exist upon the entrance of undesirable persons. It is hardly probable that the immigration measure can be dealt with by the Senate in the present session.

*As to Electing Senators.* The resolution which passed the House of Representatives so sweepingly in favor of election of United States Senators by direct vote of the people of the States, has been completely tied up in the Senate Committee on Privileges and Elections, and will probably not come to a vote on the Senate floor either this year or next. In order to prevent consideration on its merits, it was amended by its real opponents in the committee in such a manner as to provide for the holding of Senatorial elections under Federal auspices, and the regulation of other conditions as to the qualifications of voters as well as the direct supervision to insure a full and free vote. There is, of course, no more reason why the election of Senators should be under Federal supervision than the election of Representatives in Congress, or of Presidential electors. The question is a very simple one indeed. The cumulative experience of recent years has convinced most of the people of the United States that it would be well to relieve the State Legislatures of the business of choosing United States Senators. If the people of the country had not been of this opinion, it is scarcely probable that the proposed resolution to amend the Constitution of the United States would have passed the House of Representatives by a practically unanimous vote. The Senate should be willing to give the States a chance to show whether or not they would ratify such a proposed constitutional amendment.

*The Pacific Cable Question.* Unless Congress changes its mind completely,—of which there is no sort of prospect,—there will be no government-owned Pacific cable line laid. The so-called Corliss bill came before the House with fair prospects, and in such a way as to test conclusively the opinion of that body on the question of government as against private cable ownership. The route had been surveyed by the Government at a cost of \$200,000, and had been found feasible. Mr. Corliss made a strong ar-

gument to show that it would be profitable to the Government to construct the line, at an estimated cost of \$10,000,000, and advantageous to the American Government and people in every way. Opposed to the governmental project were the friends of Mr. John W. Mackey's Commercial Pacific Cable Company, which is proposing to construct on its own account a line from San Francisco to Manila by way of Hawaii and Guam. After a brief debate, the House voted, on June 11, by 116 to 77, against the governmental project.

*Questions of Money, Banking, and Business.* Although this long session has seemed to afford the best possible opportunity for the completion and perfection of the gold standard and currency laws, it was voted early in June, at a Republican conference, to postpone the subject until next December. More than a month ago the House passed a bill authorizing the Secretary of the Treasury to use the silver bullion accumulated under the Sherman Purchase Act of 1890 in the minting of subsidiary coins. This, of course, involved the repeal of that part of the former act which had required the bullion to be coined into standard dollars. It is supposed that the Senate will concur in this desirable measure. On June 17, the House, under the leadership of Mr. Ray, chairman of the Judiciary Committee, passed a series of important amendments to the bankruptcy act, the result being, according to the prevailing opinion of those best informed, a bankruptcy system more perfect, upon the whole, than that of any other country.

*The Coal Strike.* Important as the work of Congress has been this season, the affairs of the great business world have more than divided attention with those of the world of politics. First in the claim upon public attention last month was the anthracite coal strike, with its serious direct and incidental effects and its still more serious possibilities for the future. We publish in this number an interesting descriptive article upon the anthracite mining industry, from the pen of Mrs. Rhone, of Wilkes Barre; a valuable article on the anthracite coal-carrying railroads, from Mr. Newcomb, editor of the *Railway World*; and a judicious discussion of the principles involved in the strike, from Dr. Talcott Williams, of the *Philadelphia Press*. All attempts to end the trouble through the conciliation of the Civic Federation were unavailing. It gradually became apparent that the strike was not so much one for increased wages or the abatement of specified grievances, as for full recognition of the miners' union and the adoption in the

anthracite regions of the wage-scale system. The principal operators, as represented by the heads of the coal-carrying railroads, stuck steadily to their doctrine that it is not feasible to regularize labor conditions in the hard-coal region. An easy reply, of course, is that, in spite of the different conditions prevailing in different parts of the anthracite field, the capitalists themselves have succeeded in forming a combination by which they have completely eliminated competition, with the result of regulating the total output and controlling the market price. It is not necessary to assume that the wage scales demanded by the miners' union would mean uniformity where conditions do not permit. It would seem scarcely more difficult to provide different wage scales in the anthracite districts under the general sanction of the mine-workers' union, than to arrange the different scales that exist under the same auspices in the various bituminous districts.

*The Position of the Railroads.* In refusing so persistently to deal with the miners the operators would seem to be challenging public opinion rather boldly. For these operators are, in effect, the railroads themselves. Contrary to established principles, and to the laws of most States and countries, the roads have gone beyond their legitimate functions as common carriers, and have assumed monopolistic control of a necessary article of traffic and ordinary use. This relation of

the railroads to the mining, shipping, and marketing of coal is at the basis of the whole anthracite trouble. In the wild scramble, some years ago, for the acquisition of coal lands, and the control of what were formerly independent coal-mining companies, fictitious prices were paid and immense sums of money were invested upon false economic principles. The existing combination is for the purpose of making the public pay interest and dividends upon a huge volume of improper capitalization. But for this artificial situation, which—morally, if not technically—constitutes the most flagrant violation of the Sherman anti-trust law to be found in the whole country, the public could have cheap coal, the miners could have fair wages, and the railroads could charge a reasonable price for transportation. President Roosevelt, when called upon, early in June, to try to bring about a settlement of the coal strike, showed that the law under which the Pullman strike was investigated had subsequently been repealed. But Col. Carroll D. Wright, as head of the Department of Labor, made certain inquiries into the facts for the President's information. The public would like to read his report.

*Substitutes for Anthracite.* Much inconvenience was caused, especially in New York, where hard coal has been almost exclusively used, by the shrinkage in the anthracite output. Attention was naturally drawn to the question of

THE INNOCENT MAY SUFFER THE SAME AS THE GUILTY.—From the *Journal* (Detroit).

substitutes for hard coal, and the use of petroleum as a fuel was determined upon in various quarters. A number of tank steamers were chartered for bringing crude petroleum from the new Texas oil fields for consumption in New York, and naval experts announced successful experiments in the use of oil as a substitute for coal in the furnaces of warships. The chief substitute, however, for hard coal was to be found in the abundant and widespread deposits of the bituminous article; and the strikers soon found that unless they could greatly curtail the output of the soft-coal mines, their strike was doomed to certain failure. Accordingly, a convention of the United Mine Workers of America was called by an order issued on June 17, to meet in the middle of July at Indianapolis, to consider the question of a sympathetic strike among all the organized coal-miners of the United States.

COMMISSIONER CARROLL D. WRIGHT.  
(Of the United States Department of Labor.)

*The Bituminous Miners.* Such a strike, if consummated, would bring about an almost unthinkable cessation of general industry. In most of the bituminous districts, the men are working under yearly agreements with their employers as to wages and conditions. It is true that these agreements do not contain any pledges or promises that the miners will not suspend or

JOHN MITCHELL.  
(President of the United Mine Workers of America.)

abandon their work. Thus, it is not strictly fair to say that if the Western bituminous miners should suspend work in sympathy with the anthracite miners, they would thereby have violated existing contracts or agreements. It would certainly violate their agreements if the miners of Ohio, for instance, having accepted a wage scale for a year, should at the end of six months demand an immediate increase of wages, and strike to enforce the demand. But these wage scales do not obligate the employer to keep his mine running or to give full employment for a year to his men; and they cannot, therefore, on the other hand, require the men to keep on working in the mines if they choose to work elsewhere or to be idle. We are sure, however, that the bituminous miners would make a colossal blunder if they should strike, and that they would forfeit the approval of the country and destroy the confidence in their union that they had been gradually building up.

*A Ship-building Combination.* The formation of something like an ocean steamship trust under American auspices caused the indefinite postponement of the ship subsidy bill at Washington. But it remained for a combination of American shipbuilding yards to give the subsidy measure

its final quietus. The so-called "Morganization" of the Atlantic steamship lines showed that American capital can carry on an ocean business in the transport of passengers and freight without financial assistance from the Treasury of the United States Government. The explicit statements made by the leading men in the new combination of shipbuilding plants also showed,—what this magazine has again and again asserted,—that the new industrial conditions in the United States render it easily possible for our shipyards to turn out steel vessels in competition with foreign shipbuilders without government aid, whenever the right combination of men and interests choose to make the attempt. Mr. Lewis Nixon, the famous naval designer and shipbuilder, who is one of the chief factors in the new combination, has been very outspoken in his expressions of confidence in the ability of the United States Shipbuilding Company to build vessels in open competition with the European shipyards. The new company owns the great San Francisco plant which built the *Oregon* and the *Olympia*, as well as various other vessels, and it includes also such Eastern plants as the Bath Iron Works, the Crescent Shipyard, of Elizabethport, N. J., the Eastern Shipbuilding Company, of New London, Conn., and the Harlan & Hollingsworth Company, of Wilmington, Del. It has also acquired the Bethlehem (Pennsylvania) Steel Company's plant, which is especially adapted to the making of armor plate and guns. Mr. Nixon tells the public, furthermore, that the Shipbuilding Company has made arrangements with the United States Steel Corporation for the prompt and ample supply of hull steel on a basis of prices that will enable the company to compete against British and German shipyards for non-American orders. Thus, with its own steel plant at Bethlehem, the new shipbuilding concern can turn out a complete warship, armored and supplied with guns, out of its own resources and facilities.

*Europe and  
the Ship  
Trust.*

Mr. J. Pierpont Morgan's movements in Europe this summer have been more keenly watched and more constantly discussed by the newspapers of England, France, Germany, and the rest of the Continent than the comings, goings, and doings of emperors and prime ministers. Of all Mr. Morgan's achievements, nothing has impressed the European mind so much as the formation of the steamship combination. The great concern of the English last month seemed to be to prevent, if possible, the absorption of the Cunard line by Mr. Morgan's company. It was thought in England that the Cunard had given an option of purchase to Mr. Morgan and his associates, conditioned upon its failure to bluff

the British Government into bribing it with large subsidies to remain true to its old allegiance. Lord Brassey himself, the great authority on shipping, and formerly secretary to the admiralty, went before a House of Commons committee last month, to beg it to subsidize the Cunard line as the only remaining British champion in the Atlantic traffic. He declared that it would be a national disaster if the line were transferred to a foreign flag. No negotiations, however, seem to have been pending for the transfer of the Cunard line.

*Subsidies  
Wanted  
Everywhere.*

It is not primarily a matter of flags and allegiances, but simply one of a closer and more economical management of the business affairs of the great Atlantic ferry. The steamship subsidy question in England will have entered upon a new stage of discussion, as the colonial premiers,—the coronation being over,—are now settling down to their talk at London about various matters affecting the inter-relations of the United Kingdom and the great colonies. The Canadians have gone to London eager to secure support for their scheme of a great Anglo-Canadian steamship line, to be heavily subsidized by the Dominion and the British governments, and to operate in close relations with the Canadian Pacific Railroad. The chief promoters of the Canadian company,—which hopes to get a million dollars a year from the government at Ottawa, and at least twice as

JOHN BULL "SEEING THINGS."  
From the *Journal* (Minneapolis).

much from the government at Westminster,—are said to be Lord Strathcona and Sir Christopher Furness. At its recent annual meeting, the great French shipping corporation,—the Compagnie Generale Transatlantique,—explained that the absence of dividends was due to British and German competition. The French are worried about the steamship combine without seeing anything that they can do about it. It will, of course, be made an excuse for the promotion of various subsidy schemes in France, as in England. The Hamburg-American line issued to its shareholders, and thus to the public, a month ago, a very full statement of the terms of the arrangement by which the two German shipping lines had entered into a working arrangement with the Morgan syndicate.

*A Season of Prosperity.*

Business conditions in the United States continue to be favorable; and but for the disturbance caused by the anthracite coal strike, it might probably be said with truth that never at any time in the country's history has there been so much well-paid employment for everybody able and willing to work, never so little grinding poverty, and never so bright an outlook in the economic sphere for all classes of young men. There has been no slackening in the demand for iron and steel products. We have not been exporting as much as last year, but one reason for that is the unsatisfied demand of the home market. The railroads were never handling such large quantities of goods, and they are finding it profitable to spend large sums of money in improving their grades and making extensive renewals and betterments. The production of copper in May in the United States reached nearly 26,000 tons, breaking all previous records. For the fiscal year ending with June, the exports of the United States will be from \$90,000,000 to \$100,000,000 less in value than those of the year ending June, 1901; but they will still exceed those of every other year, and amount to about \$1,400,000,000. The imports, on the other hand, will amount to considerably more than those of any previous year, and the so-called balance of trade,—that is to say, the excess of exports over imports,—will be not far from \$500,000,000. The falling off in exports is in part due to the shortage of the corn crop; but also largely to the steady demand and high prices for commodities prevailing in this country, which has had the effect of keeping our products for the home market.

*The Crop Outlook.*

Late in June the general crop conditions in the United States were reported as exceptionally favorable for corn and cotton. The corn acreage seems to be

larger than ever before, and thus far the weather has been encouraging, although it will be many weeks before corn is safe from all possible vicissitudes. The winter wheat crop, much of which has now been harvested, will be a little smaller than usual. While the spring wheat outlook is favorable, the acreage is reduced, and the total wheat crop of 1902 will probably be 100,000,000 bushels less than that of last year. It will, however, still be the third largest wheat crop in the history of the country. The prospects for other small grains are good, and the reports about the various fruit crops are, as usual, contradictory. The marked feeling in the corn and cotton belts, however, is one of great cheerfulness. If the crops turn out as well as we have reason to expect, the railroads will continue to make the fine earnings they have been

GOV.-ELECT CHAMBERLAIN, OF OREGON.

lately reporting. The disposition to unify and extend railroad systems shows no check. The Northern Securities' cases are still in the hands of the courts, but the railroads concerned are meanwhile profitably employed. The plan of the United States Steel Corporation to retire \$200,000,000 of its preferred stock, and to issue bonds instead, although accepted by the holders of nearly all of the stock, was objected to by a few, and is in litigation.

*Current American Politics.*

With the approach of midsummer we find active preparation for the Congressional campaigns. In several States, also, governors are to be elected, and nominations have already been made. Oregon, which votes at an unusual date, had a close election on June 2, which resulted in the choice of Republican Congressmen and of Republicans for all the State offices, except that of governor. Factional differences in the dominant party allowed the Democrats to elect their candidate, Hon. George L. Chamberlain, by a small majority. On June 16, the people of Connecticut voted upon the draft of a new constitution, submitted to them by the recent convention, which had occupied more than four months in its work. A very light vote was cast, and the project was defeated by about two to one. The principal question at issue was that of representation in

Legislature. Connecticut still keeps its system of equal representation by towns, with the result that petty rural neighborhoods count for almost as much as large towns and cities. The rural districts dominated the constitutional convention,

JUDGE SAMUEL W. PENNYPACKER.  
(Republican nominee for Governor of Pennsylvania.)

and refused to put representation upon a modern and equitable basis. Naturally the people of the towns voted against the constitution project and defeated it. A number of Republican State conventions have been held, and their endorsement of the administration of President Roosevelt has been as emphatic as language could make it. It was not a little gratifying to the President that his Cuban policy was so strongly endorsed, and particularly that the Republicans of Western States like South Dakota and Nebraska emphatically repudiated the position of their Senators on Cuban reciprocity, and stood squarely by the President. It is also to be remarked that the Republican conventions have sustained the army administration and the War Department in their work in the Philippines and elsewhere. The Maine Republicans have renominated Hon. John F. Hill. On June 19, the Vermont Republicans nominated Gen. John G. McCullough, after a long and interesting canvass on the part of several prominent candidates. In Pennsylvania, after a tremendous preliminary contest, Senator Quay was successful in securing the nomination for governor of Judge Samuel W. Pennypacker, of Philadelphia. The Kansas Republican nomi-

nee for governor is ex-Congressman W. J. Bailey. In South Dakota the Hon. John Perrier, a Republican leader of talent, character, and promise, has been renominated. After a lively contest in Nebraska, the Republican convention, on June 18, selected the Hon. John Mickey as its candidate for governor.

The Democrats, all along the line, are putting into their platforms strong resolutions condemning the Republican Philippine policy, and are talking of tariff reform; but they have, as a rule, dropped the money question, and have cut loose from Mr. Bryan and the Kansas City platform of 1900. This is conspicuously true of the Indiana convention, held on June 4, and the Illinois convention, held on June 17. The Democrats of Tennessee have renominated Hon. James B. Fraser, of Chattanooga, for governor; and in Arkansas, Hon. Jefferson Davis has been renominated, and ex-Gov. James P. Clarke is selected to succeed Hon. James K. Jones in the United States Senate. It is too early to discover any important indications as to the Congressional elections, although the Democrats declare that they expect to make considerable gains. A great Democratic harmony meeting occurred on the occasion of the opening of the Tilden Club's new house in New York, on the evening of June 19. Ex-President Cleveland was the most conspicuous guest and speaker, and Ex-Senator David B. Hill came second. Mr. Bryan's presence had been hoped for, and he would have been highly welcomed; but he did not come. The third speech was made by that brilliant and fast-rising Democratic leader, Gov. A. J. Montague, of Virginia. Colonel Gaston, of Massachusetts, and National Committeeman Thomas Taggart, of Indiana, were the other orators of an occasion which brought together a large number of well-known members of the Democratic party. Mr. Cleveland's speech was a plea for the return to fundamental party principles as represented in the old days by Samuel J. Tilden. His words that attracted the most attention, however, were those that related to himself and his permanent retirement from political activity. Many of the Democrats in the gathering made it plain enough that they were thinking of Mr. Cleveland as a candidate for 1904.

The two great volcanoes of Martinique and St. Vincent, which wrought such dire havoc in May, continued more or less active last month, though with little additional harm to people or property. Official French statements were to the effect that 10,000 of the Martinique people had taken refuge in

*From the Vol-  
canic Centers.*

Photo taken by the New York Herald.

**A GROUP OF DISTINGUISHED DEMOCRATS AT THE TILDEN CLUB MEETING, JUNE 19.**

(In the front row, reading from right to left, are ex-President Grover Cleveland, ex-Senator David B. Hill, Gov. A. J. Montague, of Virginia, and L. Laflin Kellogg, of New York. Behind Mr. Cleveland is Mr. Robert E. Dowling, president of the Tilden Club. Behind Governor Montague is Hon. John C. Calhoun.)

Guadeloupe, Trinidad, St. Lucia, and Guiana; that about \$600,000 had been contributed from all sources for relief, and that aid had been distributed to 10,000 sufferers. In the southern part of the island of Martinique agricultural work was going on as usual. Meanwhile, a number of American scientists and explorers had been making investigations, which were duly reported at great length from day to day in the newspapers. They found, among other things, that there had been no overflow of molten matter from the

Mont Pelée crater, no topographical alteration of the country, and no change in the height of Mont Pelée. It has become known that, coincident with the eruptions in the West Indies, there were volcanic disturbances and earthquakes in several other parts of the world, including Central America, Alaska, the Hawaiian Islands, and some European countries. Among some other significant consequences of the new interest in these terrible forces of nature was the change of feeling about Nicaragua as a safe route for the

canal in view of the existence of volcanoes and the frequency of earthquakes in that region.

*South  
American  
Affairs.*

The irrepressible General Matos spent last month in a fresh and formidable revolutionary assault upon the Castro government of Venezuela. Foreign warships assembled at La Guayra to watch the situation.

*New York Herald.*

M. COMBES, NEW FRENCH PREMIER.

The rebellion in Colombia seems to have subsided to a considerable extent, although it is not yet extinct. Chile and Argentina were sensible enough toward the end of May to sign a treaty for general arbitration, limitation of naval armaments, and the placing of landmarks on the frontier. There was friction last month between Brazil and Bolivia owing to the concession by the Bolivian Government to an Anglo-American syndicate of a vast area of rubber forests in the region known as the Republic of Acre, and which is partly claimed by Brazil. The government of Haiti is in process of reorganization.

*Affairs  
in England.*

The official functions for coronation fortnight were to begin with the arrival of royalties in London on Monday, June 23, and to end with King Edward's dinner to the poor on Saturday, July 5. We publish an article from the pen of Mr. Stead on the chief British topics of the moment. Mr. Stead believes that after the coronation, in view of the making of peace, Lord Salisbury will retire from the premiership, to be succeeded by

his nephew, the Right Hon. Arthur J. Balfour. The British newspapers manifest much interest in the anticipated discussions of the colonial statesmen, under the auspices of Mr. Chamberlain, on questions of imperial trade and preferential tariffs. The death of Lord Pauncefoot, British ambassador at Washington, was deeply regretted in both countries. His successor, who was promptly appointed, is the Hon. Michael H. Herbert, formerly a member of the British legation at Washington, but for some years past secretary of the embassy at Paris.

*Various  
Foreign  
Notes.*

The expected change of ministry in France has already become an accomplished fact, M. Waldeck-Rousseau retiring at his own instance on account of ill-health. We publish elsewhere an article from the pen of Prof. Othon Guerlac on the retiring premier and his successor. It gives an account of the career of the new prime minister and an outline of the political situation. While the new cabinet is more frankly Radical, it has much in common with its predecessor, inasmuch as M. Delcassé remains as Minister of Foreign Affairs, and General Andre as Minister of War. The very successful visit of the Rochambeau party to the United States has been the subject of much friendly comment in France. The German

HON. A. J. BALFOUR READING TERMS OF PEACE AGREEMENT IN THE HOUSE OF COMMONS.

Reichstag adjourned on June 12, after having passed a bill to ratify the agreement adopted at the Brussels International Sugar Conference abolishing bounties. The strained relations between the two halves of the Austro-Hungarian empire have reappeared conspicuously in their failure to renew the so called *Ausgleich*, or tariff and commercial union, which was formed upon the reorganization of the Hapsburg dominions after the disastrous war of 1866. From Russia the reports of serious and widespread disaffection grow worse rather than better, and the enforcement of the new military conscription law in Finland threatens a dangerous crisis.

**Educational  
Concerns.**

Of the changes in our educational world, at the end of the scholastic season last month, the most conspicuous was the retirement of President Francis L. Patton, of Princeton, and the immediate election,

PRESIDENT FRANCIS L. PATTON.

—on President's Patton's motion,—of Dr. Woodrow Wilson, a professor in the university, as his successor. We publish elsewhere a sketch of Woodrow Wilson's career from the pen of his college classmate Robert Bridges, of New York. Dr. Patton remains as a professor in Princeton, and he will not be obscured as a shining light in the educational and theological world or lost as an intellectual force in American life and literature. As for President Woodrow Wilson, it is enough to say that no one doubts his eminent and complete qualifications. Mr. Alexander C. Humphreys, of New York, a well-known engineer, has been chosen to fill the place, as president of the Stevens Institute of Technology at Hoboken,

THE LATE LORD PAUNCEFOOT.

of the late Henry Morton. Dr. Joseph Swain, president of Indiana University, resigns to become head of Swarthmore College. Dr. Dan F. Bradley was inaugurated president of Iowa College on June 11, and Prof. John H. T. Main was installed as dean of the faculty. Dr. George H. Denny was inaugurated as president of Washington and Lee University, on June 17.

**Obituary  
Notes.**

Some distinguished names appear in our obituary list this month. King Albert of Saxony died on June 19 at the age of seventy four, and on the same day Lord Acton, the great English scholar and professor of modern history at Cambridge, died at the age of sixty-eight. To Lord Pauncefoot's death we have already referred. The death of President John H. Barrows, of Oberlin College, was deeply deplored. The foremost member of the Southern Presbyterian church was the venerable Dr. Benjamin Morgan Palmer, of New Orleans, who was in his eighty-fourth year. Dean Hoffman, of the General Theological Seminary of New York, and the Rev. Dr. George H. Hepworth, also died last month.

THE INTERNATIONAL ARBITRATION CONFERENCE AT LAKE MOHONK, N. Y.

## RECORD OF CURRENT EVENTS.

(From May 21 to June 20, 1902.)

### PROCEEDINGS IN CONGRESS.

May 21.—The Senate passes the "omnibus" public building bill (about \$20,000,000) and a resolution congratulating the Cuban Republic....The House begins consideration of a bill for the restriction of immigration.

May 22.—In the Senate, Mr. Hoar (Rep., Mass.) speaks in opposition to the Government's Philippine policy.

May 26.—The Senate debates the Philippine civil government bill....The House considers District of Columbia business.

May 27.—The House passes the bill restricting immigration, with amendments forbidding the sale of liquors at Ellis Island and in the Capitol building at Washington.

May 28.—The House considers a bill for the coinage of subsidiary silver....The "omnibus" public building bill is agreed on in conference (\$19,425,000).

May 29.—The Senate adopts an amendment to the Philippine civil government bill extending constitutional privileges to the Filipinos....The House passes the bill for the coinage of subsidiary silver.

May 31.—In the Senate, Mr. Spooner (Rep., Wis.) concludes his speech in support of the administration's Philippine policy; general debate of the civil government bill is closed.

June 2.—In the Senate, Mr. Lodge (Rep., Mass.) offers amendments designed to perfect the Philippine civil government bill.

June 3.—The Senate, by a vote of 48 to 30, passes the Philippine civil government bill; the Nicaragua Canal bill is then taken up....The House begins consideration of the bill for the protection of Presidents from anarchists.

June 4.—In the Senate, Mr. Morgan (Dem., Ala.)

speaks in favor of the Nicaragua route for an isthmian canal.

June 5.—The Senate passes the Military Academy appropriation bill.

June 6.—In the Senate, Mr. Hanna (Rep., O.) presents arguments in favor of the Panama route for an isthmian canal....The House closes debate on the bill for the protection of Presidents.

June 9.—The Senate begins consideration of the naval appropriation bill....The House, by a vote of 175 to 38, passes the bill for the protection of Presidents.

June 10.—The Senate passes the naval appropriation bill....The House begins consideration of the Pacific cable bill.

June 11.—The House, by a vote of 116 to 77, strikes out the enacting clause of the Corliss bill providing for a government cable to the Philippines.

June 12.—In the Senate, Mr. Hoar (Rep., Mass.) offers an amendment to the Nicaragua Canal bill in the form of a substitute, providing for the selection of a route by the President, and appropriating \$10,000,000 to begin the work....The House begins consideration of the bill providing for irrigation in the West.

June 13.—A special message is received from President Roosevelt urging the immediate passage of a Cuban reciprocity bill....The House passes the irrigation bill by a vote of 146 to 55.

June 14.—The Senate agrees to the slight amendments to the irrigation bill adopted by the House, and passes the District of Columbia appropriation bill....The House passes nearly 200 private pension bills.

June 16.—The Senate passes the London dock charges bill....The House adopts a rule for debate and vote on the Philippine civil government bill, and passes, by a vote of 94 to 18, the Senate bill to increase pensions.

June 17.—The Senate continues debate of the Nicaragua Canal bill....The House passes a bill amending the national bankruptcy law.

June 18.—The Senate concludes its debate of the isthmian canal question....The House passes the general deficiency appropriation bill.

June 19.—The Senate, by a vote of 42 to 34, adopts the Spooner substitute for the Hepburn isthmian canal bill, providing for a ship canal by the Panama route....The House begins debate of the Philippine civil government bill.

June 20.—The Senate agrees to the conference report on the Military Academy appropriation bill.

#### POLITICS AND GOVERNMENT—AMERICAN.

May 22.—The Tammany executive committee of New York City votes to abolish the finance committee and chooses an advisory committee of three to manage the affairs of the organization.

May 23.—Kansas Democrats nominate W. H. Craddock for governor.

May 28.—Kansas Republicans nominate W. J. Bailey for governor....Ohio Republicans adopt a platform and nominate a State ticket.

May 29.—Tennessee Democrats nominate James B. Frazer for governor.

May 31.—The grand jury at St. Louis makes its final report on municipal corruption, accompanied by indictments of officials....President Roosevelt, through Secretary Root, issues an order reducing the present army force from 77,287 men to a total strength of 60,497 men.

June 2.—George E. Chamberlain (Dem.) is elected governor of Oregon; the Republican candidates for Congress are successful.

June 4.—South Dakota Republicans renominate Gov. Charles N. Herreid.

June 5.—Returns from Democratic primaries in Georgia indicate the nomination of J. M. Terrell for governor.

June 6.—The Virginia Constitutional Convention adopts the new constitution by a vote of 90 to 10.

June 9.—In the New York City police department seven new captains are appointed and twenty-seven transfers made.

June 10.—Arkansas Democrats renominate Gov. Jefferson Davis.

June 11.—Pennsylvania Republicans nominate Judge Samuel W. Pennypacker for governor....The Tammany advisory committee of three, in New York City, issues a statement declaring that Richard Croker will never again be leader of Tammany.

June 16.—President Roosevelt nominates Capt. Charles E. Clark, commander of the *Oregon* in the war with Spain, to be a rear admiral.

June 17.—Maine Democrats nominate S. W. Gould for governor.

June 18.—Tennessee Republicans nominate Judge H. T. Campbell for governor....Nebraska Republicans nominate John Mickey for governor.

June 19.—Vermont Republicans nominate John G. McCullough for governor....Ex-President Cleveland and ex-Senator Hill speak at the opening of the Tilden Club's new house in New York City.

M. WALDECK-ROUSSEAU.

(Who resigned the French premiership last month.)

#### POLITICS AND GOVERNMENT—FOREIGN.

May 23.—The resignation of M. Waldeck-Rousseau as premier of France is announced (see page 74).

May 25.—The Belgian general election results in a gain of four to the Catholic ministerialists, increasing their majority to 24.

May 26.—A provisional government is formed in Hayti, with M. Boisrond Canal as President....The Congress of the Cuban Republic passes a bill granting President Palma \$300,000 for current expenses of government.

May 29.—In the Ontario elections, the government (Liberal) carries 51 of the 98 seats in the Legislature.

June 1.—At the meeting of the new French Chamber of Deputies, M. Bourgeois, the Radical, is elected presiding officer over M. Deschanel.

June 3.—The French ministry resigns office.

June 4.—In the British House of Commons, Sir Michael Hicks-Beach reviews the financial situation.

June 6.—A new French ministry is formed under the premiership of M. Combes (see page 78).

Photo by Alman, N. Y.

HON. MICHAEL H. HERBERT.

(The new British ambassador to the United States.)

June 7.—M. Rouvier accepts the portfolio of finance in the new French ministry.

June 10.—In the British House of Commons the grain-tax clause of the budget passes the committee stage by a vote of 279 to 192....Premier Combes outlines the policy of the new French ministry before the Chamber of Deputies.

June 11.—Col. Arthur Lynch, the M.P.-elect for Galway, Ireland, who formerly served in the Boer army, is arraigned for high treason in London.

June 12.—The French Chamber of Deputies passes a vote of confidence in the new ministry.

June 13.—Writs are secured against many members of the Irish Parliamentary party on the charge of conspiracy in connection with tenant troubles in Ireland.

June 16.—The Venezuelan revolutionists are reported in possession of Ciudad Bolivar.

#### INTERNATIONAL RELATIONS.

May 21.—President Loubet of France is the guest of the Czar of Russia.

May 22.—The members of the Rochambeau mission from France are received at Washington by President Roosevelt.

May 23.—A basis for the limitation of naval armaments is agreed on by Chile and Argentina.

May 24.—Six Bulgarian revolutionists are killed by Turkish troops in Rumelia....The Rochambeau statue, at Washington, is dedicated by Representatives of France and the United States.

May 25.—President Loubet of France is the guest of the King of Denmark at Copenhagen.

May 26.—President Roosevelt nominates Minister McCormick to be ambassador to Austria-Hungary.

May 27.—An arbitration treaty between Chile and Argentina is signed at Santiago....King Christian of Denmark grants an extension of time for ratification of the treaty for the sale of the Danish West Indies to the United States....Ratifications of an extradition

treaty between the United States and Chile are exchanged at Washington.

May 29.—The seventh international Red Cross convention is opened at St. Petersburg.

May 31.—The Boer representatives, together with Lords Milner and Kitchener, sign a document at Pretoria embodying terms of surrender, thus bringing the South African war to an end.

June 2.—The terms of peace agreed upon in South Africa between the Boer and British representatives are read in the House of Commons.

June 4.—It is announced that Michael Henry Herbert will succeed Lord Pauncefoot as British ambassador to the United States; Señor Ojeda is appointed Spanish minister.

June 5.—Governor-General Taft of the Philippines is received by the Pope, and enters on negotiations regarding the friars' lands....President Roosevelt sends a report to Congress on British purchasing agencies in Louisiana, holding that no violation of the neutrality laws has taken place.

June 7.—Germany and Russia propose concerted action by the powers against anarchists; President Roosevelt expresses sympathy with the movement.

June 9.—President Palma signs the bill passed by the Cuban Congress granting amnesty to all Americans under sentence or awaiting trial in Cuba.

June 11.—It is announced that the ministers of the powers at Peking have reached an agreement on the basis of Secretary Hay's proposition making a reduction of about \$10,000,000 in the Chinese indemnity.

June 16.—Señor de Quesada, Cuban minister to the United States, is received by President Roosevelt.

Photo by Alman, N. Y.

THE LATE REV. E. A. HOFFMAN.

(Dean of the General Theological Seminary in New York City.)

June 20.—It is announced that the Vatican accepts, in the main, the terms proposed by the United States regarding the disposition of the friars' lands in the Philippines, as communicated by Governor Taft, but dissents on minor points.

#### LABOR DISTURBANCES.

May 22.—All the "washeries" in the anthracite coal region of Pennsylvania shut down.

May 28.—Teamsters employed by the great Chicago packing-houses go on strike.

June 2.—Nearly 80 per cent. of the engineers, firemen, and pumpmen employed in the anthracite coal region of Pennsylvania go on strike; the pumps are worked by non-union men, protected by 3,000 special policemen....The teamsters' strike in Chicago results in much rioting.

June 4.—Eight hundred street-railway employees in Rhode Island cities go on strike....Drivers for Chicago department stores join the packing-house teamsters in a strike for higher wages, but by the aid of outside

mediation an adjustment is reached and the men return to work.

June 5.—The employers of the striking packing-house teamsters of Chicago concede the wage demands of the men, who return to work.

June 7.—A strike is declared by the bituminous coal-miners of Virginia and West Virginia for an increase of wages.

June 12.—Much disorder occurs in connection with the street-railway strike at Pawtucket, R. I.

GEN. JOHN M. SCHOFIELD.

(A conspicuous figure in the centennial exercises of West Point, in June.)

June 18.—President Mitchell, of the United Mine Workers of America, issues a call for a convention to decide on a national strike of coal miners.

June 19.—A strike of silk dyers at Paterson, N. J., leads to serious rioting.

#### OTHER OCCURRENCES OF THE MONTH.

May 31.—A monument in memory of those who fell in the Spanish-American war, erected in Arlington Cemetery, near Washington, by the National Society of Colonial Dames, is unveiled by President Roosevelt.

May 22.—By an almost unanimous vote, the Presbyterian General Assembly adopts the revised creed.

May 23.—An explosion imprisons 109 miners in a coal mine at Fernie, British Columbia.

May 26.—The terms of the agreement of the German steamship lines with the Morgan combination are made public in London.

May 27.—The French Rochambeau mission is received in New York City.

May 28.—The volcano of Mont Pelée, Martinique, shows renewed activity.

May 30.—A soldiers' and sailors' memorial monument is unveiled in New York City.

June 1.—Prof. Angelo Heilprin ascends Mont Pelée, Martinique, and views the crater in active eruption.

June 8.—There is an outbreak of the volcano Kilauea, on the island of Hawaii.

June 9.—Nearly 200 Yaqui Indians—men, women, and children—are massacred by Mexican soldiers.

June 9.—The opening exercises of the centennial anniversary of the Military Academy at West Point are held (see page 45). . . . President Francis L. Patton, of Princeton University, resigns; Prof. Woodrow Wilson is chosen his successor (see page 36).

June 16.—A review of 31,000 British troops is held at Aldershot.

#### OBITUARY.

May 21.—President William Clarke Whitford, of Milton College (Wisconsin), 74. . . . Major Seward Dill, one of the founders of the Republican party in Maine, 90.

May 22.—Gen. Mariano Escobedo, commander-in-chief of the republican forces in Mexico which overthrew the government of Emperor Maximilian in 1867, 75. . . . Dr. John Vedder, of Kingston, N. Y., president of the New York State Anti-Vivisection Society, 86.

May 23.—Thomas Campbell Bushnell, of Morristown, N. J., a director of the Standard Oil Company, 60.

May 24.—Lord Pauncefoot, British ambassador at Washington, 74. . . . Justice George P. Andrews, of the New York Supreme Court, 67.

# *Elect* President of United States 1913 —

## PRESIDENT WOODROW WILSON.

BY ROBERT BRIDGES.

BY the election of Woodrow Wilson to be its president, Princeton has, for the first time in thirty-four years, one of its own graduates at the head of its affairs. Dr. Wilson is, moreover, representative of what is best in Princeton,—the Princeton re-created by McCosh, and admirably developed by Patton, out of the old Princeton which the Civil War had so terribly crippled. He also represents one of the most important elements in the life of that old ante-bellum Princeton,—the Southern man who once dominated the student life. Woodrow Wilson is a Virginian, with that inborn love of the study of statecraft which has been the heritage of so many Virginians from Madison and Henry to the present day.

But he is a great deal more than the product of a State or a section. His education represents many phases. He studied, first, at a North Carolina college; he took his academic degree at Princeton, his law degree at the University of Virginia, and his doctorate of philosophy at Johns Hopkins. He practiced law in Atlanta, Ga.; he taught history at Bryn Mawr, in Pennsylvania; and then at Wesleyan, in New England. While there he began to be known as a public lecturer all over New England, in its most intellectual centers. With that openness of mind which is one of his chief characteristics, he absorbed from North and South what was best. With this cosmopolitan education and training, he is to-day the product of no section,—he is a representative American.

Though his education has been so varied, there has been no haphazard in his career. Every step that he has taken has been one of conscious choice, leading to a definite, logical end. No one who knew him intimately in his undergraduate days had any doubt about his aim in life, or, what is more remarkable, had they any doubt of his ultimate achievement. That a boy under twenty should so impress other boys under twenty is not unusual; but that his whole career should be an abundant fulfillment of the boy's ideal is the remarkable thing.

This choice of *the best thing for his own purpose* was the marked quality of Wilson in his student days. He knew exactly what he wanted to do, and he had very definite ideas as to what part of the curriculum would help him to do it. He worked hard at the thing he wanted and let the rest go. What relative rank in class this system

of selection might bring him did not interest him in the least. He practiced the elective system in his own career ten years before Princeton had much of it in the curriculum.

Those who knew him well soon learned what he was driving at. He proposed to "study government and write about it." He knew that a necessary part of the preparation for it would be the study of law; but whether he should find the best opportunity to make himself a writer on Institutions through the practice of law, or through public life, or through teaching, he did not know. Of one thing he was sure,—if the practice of law did not give him the opportunity to write about government, by the application of law he would abandon it.

He also knew that not only must he be a good writer, but a good speaker and debater, if he was to make public affairs his career. Government is a device of men, and human nature is back of it and always present in its application. He showed an early intolerance for mere book knowledge; he wanted to understand the workings of men in the mass and individually. This science of government interested him because it was intensely human, and because he was himself intensely human. There never was a bit of the prig or "dig" about him. He was a marked man intellectually, but made no bones about it. He knew every kind of man in the class, and every kind of man knew him, and most of them liked him,—unless they were stupid or insincere. He was so intolerant of duplicity and impatient with stupidity that those people stayed out of his way.

He gathered around him a coterie of men who were interested in similar questions, and they debated them vigorously. In the literary Hall he was always ready for a debate, and in the actual machinery of the government of that often unruly body of two hundred men he took the liveliest interest. A society founded by James Madison in his undergraduate days would naturally furnish a favorite forum for his mind. One thing we soon found out,—and that was that, although Wilson was always ready for debate, he would never argue on a side which he did not believe. And so when the preliminary contest for the greatest debating honor of the course came—the Lynde debate—and Wilson drew the side of a question in which he did not believe,

he instantly withdrew from the competition. He was easily the best debater we had, and it was giving up a certainty, but he never hesitated. He did not believe—and that was enough.

There was one question that he never tired of arguing; when all other topics failed, and a lively tilt was wanted, some one would broach the question of Cabinet government as opposed to Committee government. I don't think we cared much about the question, one way or the other, but it was fun to hear Wilson argue it. We could always draw fire also with Burke, Brougham, Bagehot, or Chatham. He used to read their speeches out loud in Potter's woods, in order to get the swing of their style. And to-day, if you will read Wilson's books, or hear him make a speech, you will see the part that those great Englishmen played in the making of his own style.

It is often easy to write this sort of thing about a man *after* the fact, and make it fit his achievements. But in this case it is a matter of record in black and white. His essay on Cabinet Government was written and accepted by the *International Review* while he was an undergraduate. The old *Nassau Lit.* contained his famous essay on Earl Chatham, which is good reading to-day, and several hundred men will vividly recall his brilliant oration on Richard Cobden.

There was a definiteness of purpose, a maturity of achievement, about Wilson's undergraduate days which make them worth recalling. Moreover, he was always a good fellow, interested in every phase of college life,—president of the athletic association, editor of *The Princetonian*, a leader in social affairs, and the most loyal classmate and friend.

It was natural that, after graduating in 1879, Wilson should return to his native State, to the

Photographed last month especially for the REVIEW OF REVIEWS by Pirie MacDonald, New York.

PRESIDENT WOODROW WILSON, OF PRINCETON.

University of Virginia, to study law. There he left the same record of vigorous clearness in the pursuit of his aim as at Princeton. He practiced law in Atlanta, Ga., in 1882-83, in the same office with a man of congenial literary tastes. The net result of that experiment was the conviction that for him at least the way to a knowledge of the science of government, and the opportunity to write about it, did not lie through the routine of law. But the experience has left with him a flexibility of mind, an easy adjustment to all kinds of audiences, and a fund of anecdote which unite to make him one

of the most effective and graceful of after-dinner speakers, and a ready man in the emergencies of public life.

When he abandoned law practice, in 1883, he went to Johns Hopkins University, and found a stimulating atmosphere of vigorous mental life, the inspiration of which was "original research." Here he had the opportunity, as Fellow in History, to perfect his knowledge and polish his style in preparation for the final draft of his first book, at which he had been working since his undergraduate days. When completed it immediately found a publisher, and served also as the thesis on which Johns Hopkins granted him his Ph.D.

This book on "Congressional Government" (1885) was the first attempt that any one had made to describe the actual workings of our system in practice as developed from the theory of the Constitution. There was a literary charm about its style and a fine moral enthusiasm in its argument that immediately made him a far larger audience than a book on politics is apt to gain. The book remains, after seventeen years, the standard authority on the subject, and was the acknowledged basis of Mr. Bryce's chapters on committee government. Wilson was not yet thirty years of age, but gained at a bound a recognized place, not only among students of politics, but as a man of letters.

His next book, "The State" (1889), was a feat of scholarship, and by the breadth of its subject and the necessity for condensation, allowed little opportunity for the graces of style,—except for that supreme grace of clearness. It was the first book in English to present the workings of all constitutional governments as they are carried on at the present day, and it has held its place ever since as a college text-book.

In the writing of history he first showed his skill in "Division and Reunion," a sketch of the period from 1829 to 1889, and a few years later he produced a brilliant popular biography of "George Washington" (1897). These books have led up to his "Colonies and Nations," a "History of the People of the United States," an elaborate work, in four volumes, which he has just completed, and which will be published this fall. The chapters from it which have appeared in *Harper's* show that he has written a history that is fascinating in style and scholarly in matter. It is the first important history of the United States written by a Southerner,—but it is not a Southern history. It represents all the elements that have gone to the making of this great country. The New England point of view has heretofore dominated our historical writers. Professor Wilson's point of view is broadly American.

Two volumes, collected from various periodicals,—"An Old Master" (1893) and "Mere Literature" (1896),—show Wilson's versatility, lightness of touch, and quality as an essayist.

Admirable as his achievement has been as scholar, historian, and essayist, it would not of itself designate him as the ideal man to be president of a university. Along with it goes a wonderful success as a teacher for a period of seventeen years. As lecturer on Administration at Johns Hopkins, for ten years, he was brought in contact with a picked body of students from all over the country, many of whom are now professors in the leading universities. At the same time he was lecturing on Constitutional Law at the New York Law School, before men of an entirely different cast of mind; and his elective classes at Princeton, since 1890, have been the largest in that institution. He has been in constant demand as a public lecturer for many years.

In purely executive work he has shown force, diplomacy, and acuteness as a member of the most important committees in the Princeton faculty. All his life he has studied executive problems, and his fitness for executive work has been so marked for years that he has received invitations from many important institutions to be their president. It was told on the Princeton campus the other day that one of the political parties had asked him, months ago, to run for State Senator, and recently a Western newspaper pointed him out as the right kind of man to be a candidate for President of the United States.

That is the man whom President Patton, with the intellectual acuteness which he always exhibits, designated as his successor and the trustees unanimously elected. Princeton has never grown more rapidly than under Dr. Patton's presidency. It has been reaching out in many directions toward what is best in the modern system of education. Schemes have been started that as yet are formless, and Dr. Patton, with wonderful clearness, recognized in Woodrow Wilson the man to guide them to efficient completeness. At forty-five, Dr. Wilson takes up the great task with vigor, and a reasonable hope of years of successful labor. He knows the leading men and the best methods in universities here and abroad; the loyal body of Princeton alumni (and none are more loyal) throughout the country know him personally and trust him; and the undergraduates welcome him with cheers.

He has a great task, but he also has a great courage. And back of it lies the superb equipment founded on years of single-minded, persistent training in the science of government, leading up to this opportunity for applying it to the needs of Princeton University.

# THE SOUTH AFRICAN PEACE, THE CORONATION, AND THE BRITISH OUTLOOK.

BY W. T. STEAD.

[The following article was mailed from England on June 11,—some days before the news of King Edward's serious illness and resulting operation.—THE EDITOR.]

THE conclusion of peace in South Africa, on the basis of the complete effacement of the Boer republics, has been welcomed with relief by everybody. The public had long been sick of the war. The King was most anxious to have the war out of the way before his coronation. The Boers were almost at the end of their resources, and so,—in May, 1902,—a surrender was arranged which might have been carried out twelve months earlier, if Mr. Chamberlain had supported Lord Kitchener, instead of ridiculing him, when he attempted to come to terms with General Botha. For more than eighteen months the war has dragged on solely because of the utter distrust of the Boers in the good faith of the British Government. They believed that Mr. Chamberlain and Lord Milner were mere tools in the hands of Mr. Rhodes. They passionately protested that every effort they had made to avert the war had always been thwarted by Lord Milner or Mr. Chamberlain, and hence it was impossible to trust their promises, even if, as Mr. Fischer said, "They swore on a sackful of Bibles." They believed in Sir Redvers Buller, and of late they learned to place confidence in Lord Kitchener. But Lord Roberts abruptly destroyed Buller's chance of arranging peace by insisting on unconditional surrender, and Mr. Chamberlain paralyzed Lord Kitchener by contemptuously repudiating the terms on which the latter had almost made peace with General Botha. But in March Mr. Rhodes died, and about the same time the King's impatient anxiety to have peace before the crowning induced Mr. Chamberlain and his colleagues to give Lord Kitchener another chance. This time the negotiations were crowned with success. The Boers, having to deal at last with one whom they could trust, agreed to abandon a struggle which they had waged with such astonishing resolution for two years and seven months.

## WHY PEACE WAS LONG DEFERRED.

More than eighteen months ago, conditions substantially identical with those now agreed upon were informally submitted to President Krüger and the Boer delegates in Holland. They failed because of the rooted distrust which prevailed until Mr. Rhodes died and Lord Kitchener

became master of the situation. The formula was, "Give up your independence and you can have what conditions of peace you like;" to which the reply was, "Let us retain our independence and you may have any guarantees you like in the shape of the voluntary cession of this, that, or the other prerogative of sovereignty." It was in vain that it was pointed out to them that a British self-governing colony like Australia or Canada had far more real independence, coupled with the right of secession, than the Transvaal ever possessed. "What security," they asked, "have you to offer that we shall have the rights of an Australia or a Canada? Remember that a British Government promised us three times over representative government when we were first annexed, and after four years they placed us under the rule of the soldier, Sir Owen Lanyon. Once bit, twice shy."

## THE FINAL TERMS.

It remains to be seen whether the confidence which has at last been established in Lord Kitchener will be justified by events. The terms of peace are declared by many unthinking persons to be amazingly generous. Such a judgment is superficial, and will be reversed on reflection. The three millions sterling given as a free grant is merely the acceptance of the responsibility to meet the obligations entered into by the governments of the republics when they commandeered private property at the early stages of the war. The Boer governments issued notes and gave receipts, which became part of the floating debt of the republics. When the republics were annexed, the annexing government took over the debts of the conquered states. One of the first charges upon the so-called free grant will be the repayment of the gold seized by the Transvaal Government belonging to the mine owners of Johannesburg. When all the obligations thus incurred have been met, there will be little or no surplus for the compensation of the sufferers from the policy of devastation adopted to bring the war to a close. The rebuilding of the ruined farms, and the replenishing of the stock driven off or killed by the devastating columns, are to be provided out of loans advanced to the Boers by the English

THEIR MAJESTIES, KING EDWARD VII. AND QUEEN ALEXANDRA.  
(Taken in the robes worn at the opening of Parliament.)

Government for the first two years without interest; but after that period the loans must be repaid by installments, plus 3 per cent. interest. According to the principles of international law defined at the Conference of The Hague, all private property seized or destroyed during the campaign on the plea of the necessities of war ought to be paid for when the war is over. But the British Government, at the close of the war as at the beginning, has shown a cynical indifference to the recommendations which they made at the conference of peace.

#### THE MEANING OF BRITISH FEDERATION.

The future of South Africa depends upon the spirit in which its masters carry out the provisions of the settlement concluded with the Boers. If the King's ministers were to boldly adopt a wide and comprehensive constructive policy, they might even now secure South Africa for that loose confederation of self-governing republics which, by a somewhat absurd misnomer, is described as the British Empire. If they were to announce that, as the fortunes of war had compelled them to provide a new constitution for South Africa, they had decided to organize the country as an organic whole on the basis of federation,—and if they were, as a proof of this determination, to summon a nominated constituent convention, to which all the more prominent representatives of the Dutch were invited for the purpose of framing the future constitution of South Africa,—there ought to be some hope, even if, as a first step, Lord Milner's advice was taken, and the Cape constitution was formally suspended for eighteen months or two years. The constituent convention would have to decide upon the areas of the federated colonies, to name the period within which representative government should be established in each state, and to recommend how the various functions of government should be divided between the federal assembly and the local legislatures. If such a constituent convention ever met, it would probably frame a constitution for South Africa very much on the lines of the Constitution of the United States, and in the near future the only symbol of British domination would be the union jack. In all South African affairs, the federal and the state legislatures would be as free to govern South Africa in the interest of the Afrikaners as if the British flag no longer fluttered over Cape Town and Pretoria. In the natural but inevitable evolution of the English-speaking race, the British flag tends more and more to become a mere symbol of a race alliance, based solely upon sentiment and interest. It is an alliance from which each partner may secede at his discretion; but

while it lasts it secures for all the allied nations the protection of the armed forces of all the members of the alliance. Whether the common center of such an alliance of the English-speaking commonwealths of the world will be at Westminster or at Washington, time alone can decide.

#### THE CROWNING AT WESTMINSTER.

For the moment, however, the political center of all English-speaking states outside the ring fence of the United States of America is at Westminster, and this midsummer the fact that the center has not yet shifted westward is being advertised to the world at large, and to the English-speaking world in particular, by the coronation of Edward VII. In this world, in which uneducated man is so largely influenced by symbol, it is impossible to deny the utility of ceremonial. In former times, the consecration and coronation of a sovereign was a thing almost too solemn to be merely human. As in the mass the consecrated wafer and the juice of the grape were believed to be transformed into the very Body and Blood of the Lord, so a ruler, who was merely human at his accession, became transfigured at his coronation, thenceforth remained a semi-divine personage, vested with semi-miraculous privileges and prerogatives, with right divine to govern wrong. The cynical observer may mutter Lowell's sarcastic couplet, "A mountain stream that ends in mud, methinks, is melancholy," as he contemplates the changes that have converted the magic, mystic, miracle-working ceremony of the middle ages into a mere pageant for the advertisement of the importance of the crown in the imperial system. No one of all the thousands who in the crowded Abbey will witness the crowning of the King, not even one of the millions who will read about it in the newspapers, will be for a moment deluded by the scenic splendor of the stately ceremonial into a belief that the central figure experiences the slightest change as the result of all the genuflexions, presentations, consecrations, and coronation of which he will be the subject. Even the King himself, although naturally prone to the common delusion of royalties that he is made of different clay from that of ordinary mortals, is too mundane a man of the world to be deceived by the elaborate make-believe of the coronation so far as to imagine that he is invested with any power beyond that of influence.

#### THE KING'S REAL POWER.

That power resulting from a privileged position which makes him privy to all the counsels of his ministers, and which also makes him the most conspicuous symbol of imperial unity, is un-

doubtedly much greater than most political men are willing to admit. The British colonies, year by year, become more and more independent nations. The most loyal among them would revolt tomorrow if it were required to submit to the domination of the Imperial Parliament. But one and all submit eagerly to the supremacy of the British crown. There is nothing which angers a native-born colonist so much as to suggest that he is in any way the subject of the inhabitants of the mother country. The complacent talk in London newspapers about "our empire" provokes nothing but resentment among colonists, who, sometimes with oaths and curses, repudiate the arrogant assumption that they in any way belong to the mother country. But inasmuch as the power of the crown has long since been reduced to a mere shadow impotent to harm, and as the throne of Alfred the Conqueror, of Richard the Lion Heart, and of Edward III. still looms large on the horizon of history, they are most profuse in their protestations of loyalty to the King. He never does them any harm, he interests them as a picturesque human figure, raised sufficiently above the heads of the common crowd as to be visible all round the world; he is in their eyes the symbol of unity, and honors bestowed by him acquire an added grace by the fact that they have passed through his hands. Hence it is doubtful whether the empire would survive the disappearance of the monarchy.—anachronism though the crown may appear to the matter-of-fact American, it nevertheless serves a practical end, and any attempt to replace it would have far-reaching results.

Even if we grant that the monarchy has become a mere fetich, the fact that it has been so completely deprived of any real executive authority in the state is a reason the more for exhausting the resources of advertisement in order to give to the fetich the semblance of authority. The survival of the British monarchy is an instance of the determination of the ordinary man both to eat his cake and have it. He has long since appropriated to himself all the important prerogatives of royal power; but although he possesses the substance, he is not less solicitous about preserving the shadow. Hence Britain is both an empire and a republic, an empire in its shiny trappings, and in all the paraphernalia of royal pomp, but an essential republic in that all real power to legislate, to levy taxes, to make war or peace, is placed in the hands of the people. The monarchy, in short, is a historic fiction diligently preserved in nominal being because of its exceeding usefulness in keeping up appearances and preserving the continuity of the administration. From a legal point of view, the monarchy

was so necessary in England that the whole force of English lawyerdom was used for the purpose of investing Oliver Cromwell with the regal status. The old monarchical ruts were worn so smooth and deep that the state coach jolted horribly when an attempt was made to drive it along a republican track.

#### AN INDUSTRIOUS MONARCH.

The more the institution is exalted, the more the individual dwindles. The ancient dignity and famous associations of the throne suffice to weave a glamour even over royal rascals and imbeciles. Albert Edward VII. is not a Victoria, neither is he a George IV. He is as fond of the turf as Richard Croker, he goes regularly to the theater, he plays at bridge, and his frank enjoyment of the society of ladies of the type of Mrs. Keppel exposes him to animadversions in many quarters,—not usually censorious of the amusements of kings. But the recreations of royalty bulk much more conspicuously before the eyes of their subjects than the amount of hardcollar work which the occupancy of the throne entails. Edward VII. takes himself seriously, discharges the work of his exalted office punctiliously, and, under the yoke of empire, is learning to restrain his former flea-like disposition to jump about fitfully from subject to subject in conversation as the whim of the moment dictated. Sir Harry Johnston told me that when he returned from Uganda, he found the King much more intelligently informed concerning the burning questions of Central Africa than any of his ministers. In the British Empire there are many Ugandas. The King must meet the governors of each of them; and if he masters all their dispatches sufficiently to discuss them with their authors on their return to the capital of the empire, he must often burn the midnight oil and spend laborious days.

#### THE FIRST "IMPERIAL" CORONATION IN LONDON.

The coronation has preoccupied public attention in London for months past. There has not been a coronation in Westminster for sixty years. When Victoria was crowned, one-half of the present area of the empire lay outside her dominions, and the number of the subjects of the Queen on her accession were hardly more than half those who acclaimed the coronation of the King. The British Empire, as we know it, was practically the creation of the Victorian age. The colonial premiers, the Indian princes, and many others who will figure conspicuously in the Abbey at the King's crowning were conspicuous by their absence at the last coronation. When the last reign began, the peers traveled up from

their country places in coaches ; the railway system was but in its cradle, and the concentration of millions from the whole country around one center of public interest was practically impossible. The age of steam is giving place to the age of electricity, and both steam and electricity combined to enable the lieges to gorge the crowded metropolis with myriads of sightseers.

On Thursday, June 26, the coronation ; on June 27, the great procession through the capital ; on Saturday, the 28th, the inspection of the fleet in the Solent. So the great festival opens, and all the following week the royal and imperial junketings will continue. The conduits freely running wine, which used to be so conspicuous a feature of similar festivals, have disappeared ; but the public houses amply supply the need for alcoholic stimulus, and the abandonment of semi-intoxicated crowds of men and women to manifestations of maudlin enthusiasm, of which there has been too much of late years, furnishes at least a rude object lesson as to the immensity of the task that awaits the rural reformers who would dare to try to civilize the brute mass of British barbarism.

#### THE EDUCATION BILL AND THE NONCONFORMISTS.

There is little prospect of this task being attempted by the present ministers. As the eyes of the fool are at the ends of the earth, so ministers have squandered so many millions in the destruction of the Boer republics in South Africa that they have no resources left for educating, civilizing, and moralizing the poor savages of the slums. The education bill, which was originally presented as an attempt to improve or create a system of secondary schools, is now generally recognized as a measure whose sole aim is to strangle the system of public elementary education established by Mr. Foster and Mr. Gladstone in 1870, and hand over the whole duty of primary education to the denominationalists ; that is to say, five schools out of six to the Anglican clergy, one-half of whom teach doctrines of sacerdotalism from which our forefathers would have recoiled as "flat popery."

To deliver over the primary schools of Great Britain to Anglican priests may no doubt be defended as an indispensable means of weaning England from the heresies of the Protestant Reformation, but the pretence that such a measure is conceived in the interest of public education is too transparent. A fierce wrangle has begun over the bill,—which, it is now evident, cannot be carried this session. To hold an autumn session in coronation year for the purpose of permanently handicapping nonconformists, by placing the control of public education in the hands of their

Anglican enemies, was hardly regarded as one of the boons which the present ministry would confer upon the nation. The attempt to give the schools to the Church will have one excellent result. Of late years many nonconformists have been backsliding from the political faith of their fathers. Forty years ago,—nay, twenty years ago,—an English nonconformist who was not a devoted Liberal was rare indeed. But, with the removal of most of their special grievances, and the growth of wealth among dissenters, the chapel lost its special character of a Liberal stronghold. The Church now, as ever, was a rallying center of the Conservative forces, only inferior to the public house. The anti-papal prejudices of some of the pseudo-nonconformists drove them over into the Unionist ranks ; but it was not until last general election that the Liberal *debacle* was complete. The nonconformists were hopelessly divided by the war, and nonconformity as a distinct political force, almost ceased to exist. The education bill is evidence that the Church party realizes its opportunity. It is striking when the iron is hot, and availing itself of an opportunity not likely to recur for the purpose of establishing the ascendancy of the Anglican sect and permanently reducing the nonconformists to a position of galling inferiority. If the bill passes, the chapel will once more become the rallying point of the forces of Liberalism ; and the Church, at some not distant day, may be disestablished and disendowed in revenge for this Jameson raid on the public schools.

#### LORD SALISBURY'S RETIREMENT.

This, however, is an affair of the future. What is of more immediate political importance is the resignation of Lord Salisbury and its immediate consequences. Lord Salisbury, for a year past, has privately given out his determination to lay down the premiership when the war ended and the King was crowned. He is an old man and heavy with fat. He has achieved everything in the way of personal success that a British politician can aspire to. He is weary of the possession of power, and wished to retire altogether some time ago. Of late, as the hour of his intended resignation draws near, he has been singularly reserved as to his intentions, and so great is the fear and the awe of him that overshadows his colleagues none of them dares to ask him what he means to do. It is assumed, however, that he will resign after the coronation, and leave the task of carrying on the government of the realm to his nephew, Arthur Balfour. There has been some discussion of late as to whether or not the new ministry will dissolve Parliament and appeal to the country for new

lease of power. Such a step is extremely unlikely. A dissolution, like death, is usually postponed to the last moment, even by the miserable who contemplate suicide. The ministers have a solid majority, elected on the khaki cry, that is admittedly much greater than any they could hope to secure now that the war is over. Why, then, dissolve?

#### HIS SUCCESSOR?

The opposition would, no doubt, like a dissolution. They could not fail to improve their position. But the fact that the opposition desires it is an additional reason why the supporters of the ministry dislike it. We may take it then that Mr. Balfour will not dissolve, but will carry on, with a reconstructed ministry, very much on the old lines. There has been some talk of Lord Lansdowne being selected as Lord Salisbury's successor. Such an arrangement would only have one advantage,—it would release the premier from the drudgery of leading the House of

Commons. But Lord Lansdowne, although an estimable man of considerable ability, has no standing in the country. He is an indifferent speaker. At the War Office he was not remarkable for strength, and although as foreign minister he has done fairly well, his selection by the King would excite some surprise, and in the Unionist party would occasion much dissatisfaction, for the Tories do not care to be led by the Liberal Unionists. If the Duke of Devonshire were not so indolent by nature, he would have a chance far superior to that of Lord Lansdowne. Mr. Chamberlain is stronger than either, but he is a Liberal Unionist. He could not lead the House of Commons with success, and he would not press his claims against Mr. Balfour. We may expect, therefore, that Mr. Balfour will succeed his uncle, and that the long-suppressed differences among the Unionist majority will ripen under his rule, until at last the Liberals, having come together, the long reign of the Unionist party comes to its natural end.

WESTMINSTER ABBEY, THE CENTRAL SHRINE OF THE BRITISH EMPIRE.

WEST POINT CADETS ON PARADE GROUND DURING INSPECTION.

## WEST POINT AND ITS CENTENARY.

BY COLONEL SAMUEL E. TILLMAN.

**T**HE centenary of the Military Academy, held on the 9th, 10th, and 11th of June, makes interesting the following facts as to its history, organization, and purpose.

It has long been recognized that war cannot be conducted to the best advantage by any people without the possession of military training and knowledge. This education can only be acquired by study and instruction, or by experience in the field; the first requires military schools, the second depends upon the existence of a standing army. A large proportion of the people of our country have always been very sensitive with regard to the maintenance of a standing army, yet those responsible for the country's welfare, as a rule, have fully recognized the advantage and desirability of having as wide a dissemination of military knowledge among the people as possible. The establishment of military schools in this country was delayed by a fear of offending the sentiment with regard to a standing army.

The early appreciation of the need for a military school is shown by the action of the Continental Congress in the autumn of 1776. This Congress, on September 20 of that year, appointed a committee to "repair to Headquarters near New York, to inquire into the state of the Army, and the best means of supplying its wants." This committee while at the camp conferred with General (then Colonel) Henry Knox, of the artillery,

and received from him, on September 27, "Hints for the improvement of the Artillery of the United States," in which, among many others, is found the following: "An Academy established on a liberal plan would be of the utmost service to the continent, where the whole theory and practice of fortification and gunnery should be taught; to be nearly on the same plan as that at Woolwich, making allowance for the difference of circumstances."

The committee reported on October 3, and one of their recommendations was "that the Board of War be directed to prepare a continental laboratory and a military academy, and provide the same with proper officers." On October 1, two days before its committee reported, Congress, being apparently eager for action, "Resolved that a committee of five be appointed to prepare and bring in a plan for a Military Academy at the Army." This committee does not appear to have made any report, and during the active struggles of the Revolution no further measures seem to have been devised to carry out the expressed intention of Congress.

At the termination of the war, Alexander Hamilton, chairman of the Committee on Peace Arrangements, on April 11, 1783, asked of General Washington his opinion as to what ought to constitute a proper peace establishment. Washington invited the opinions of his officers upon the matter. General Huntington, Colonel Pick-

ering, the Quartermaster-General, and Du Portail, the Chief of Engineers, all recommended the establishment of a military academy, the first two suggesting West Point as the proper location for it. Hamilton at this time did not favor an academy, Washington did.

In 1790, Knox, as Secretary of War, in his report to the President, again dwells upon the great advantages to be had from military schools. In 1793, Washington commended the matter to the favorable action of Congress, it having been previously discussed in a cabinet meeting, at which Jefferson opposed it as unconstitutional. Hamilton and Knox favored it. Washington said that he was so impressed with the necessity for the measure that he would recommend it, and leave Congress to decide its constitutionality.

An act of Congress of May, 1794, provided for a corps of artillerists and engineers to which thirty-two cadets were to be attached, "and made it the duty of the Secretary of War to procure, at the public expense, the necessary books, instruments, and apparatus for the use and benefit of said corps." After this act, and upon the recommendation of Washington, a school was established at West Point in 1794, and continued until the destruction of its plant by fire in 1796.

After this fire, Washington again, in December, 1796, urged Congress to provide for the school. In 1798 and 1799, in writing to Hamilton, the then Secretary of War, he again refers to the great importance of a military academy, and only two days before his death he alluded to his own interest and persistent efforts in trying to procure its establishment.

In January, 1800, President Adams sent, with a special message to Congress, a report of William McHenry, the Secretary of War, which report strongly set forth the necessity for a military academy, and fully stated the inadequacy of previous legislation upon the subject, and proposed a plan for a more extensive school. In July, 1801, General Dearborn, the Secretary of War, under authority of the act of 1794, ordered all cadets of the Corps of Artillerists to report to West Point for instruction.

By act of Congress of March 16, 1802, the Engineer Corps was separated from the artillerists, and it was provided that "said corps, when organized, shall be stationed at West Point, in the State of New York, and shall constitute a Military Academy." This corps consisted of five officers and ten cadets.

Prior to this date military instruction had been possible, to a limited extent, by executive action under the law, but a military academy had not been constituted by law until the passage of this act. This act of Congress was approved by Jefferson, who no longer questioned the constitutionality of an academy, and the school was formally opened on July 4, 1802, with Major Williams, Chief of Engineers, as superintendent, two teachers, and ten cadets. Washington was a most persistent advocate and one of the principal projectors of the academy; Jefferson was its legal founder, and the first superintendent was the son of the patriot Williams, who presided at the Faneuil Hall meeting to forbid the landing of the tea in Boston.

Notwithstanding the high character, great

A VIEW OF BARRACKS AND PARADE GROUNDS FROM FORT PUTNAM.

ability, and untiring devotion of the first superintendent, the academy was of slow growth. The facilities for instruction were inadequate, interested support of the War Department was lacking, and the superintendent himself was overburdened with other weighty cases, and necessarily much absent from the academy. The first fifteen years of the academy's existence was very torpid. During this time cadets were admitted without mental or physical examinations at ages varying from thirteen to thirty years, and at all times of the year. There were no regular courses of study and no annual classes. The term usually began in April and ended in November.

The cadets were graduated whenever deemed competent for promotion in the army, and in the first fifteen years less than two hundred were graduated. Notwithstanding the unsatisfactory condition of the academy during these years, many of the cadets who passed through it were greatly benefited. Some entered the academy after having had collegiate training elsewhere; others were of mature age, and came with determined purpose; still others made the most of their opportunities, so that the institution partly met the purpose of its creation. During this time also apparatus and facilities for instruction had increased, buildings improved, and quite excellent and full regulations had been adopted, though they were not enforced.

One of these regulations provided for a permanent superintendent of the academy; and under this clause Major Thayer, of the Corps of Engineers, became superintendent in July, 1817. He was only thirty-two years of age when he assumed the command, was very able and deeply enthusiastic, had studied abroad, and had had valuable field experience in the War of 1812-15. Thayer's conception was thorough discipline in both a mental and military sense, accompanied by the most potent means for the strengthening and development of character, and for the detection and elimination of the mentally and morally unworthy. The accomplishment of these ends he sought through (1), the establishment of proper courses of study and military exercises, (2) rigid requirements impartially enforced under strict but wise supervision. The soundness of his

A VIEW OF GARRISON, N. Y., FROM WEST POINT.

judgment and the wisdom of his efforts are shown by the marvelous rapidity with which he brought system out of confusion and transformed the then existing conditions.

Fortunately, almost from the beginning of his administration, he had the earnest and enlightened support of the Secretary of War, J. C. Calhoun. Within ten years, Thayer and the able colleagues whom he had gathered around him had introduced and firmly established the essential framework of the system of academic and military instruction which has since prevailed. This system has been the basis of the strict, impartial, salutary, elevating, and disciplinary government ever since existing at the academy. Three-quarters of a most progressive century have elapsed since the period referred to, during all of which the academy has been freely open to investigation, inspection, and modification. Successive companies of her children, able and earnest, have administered her affairs, studied her methods, and eagerly sought for improvement. The system of Thayer has been extended and somewhat modified, but its essential framework has remained the same, and is the support of the developed West Point of to-day.

The Military Academy at present consists of the Corps of Cadets, the Academic Board, and the other officers of the academic and military staff. The total number of cadets now permitted by law at the academy is 482, one from each Congressional district, one from each territory (including Hawaii), and one from the District of Columbia, two from each State at large, and thirty from the United States at large. All are

MONUMENT TO COLONEL THAYER, FATHER OF THE  
MILITARY ACADEMY.

appointed by the President; and, with the exception of those appointed from the United States at large, all must be actual residents of the districts from which they are appointed. Those from the United States at large are selected by the President, those from the States at large are selected by the Senators, and those from the Congressional districts and Territories by the respective Representatives in Congress. Under the new apportionment law, which goes into effect in 1903, the number of cadets allowed will be 511. It is thus seen that the Corps of Cadets is perfectly representative of the entire country. This method of making the selection from each Congressional district became a legal requirement in 1843, though it had come into very general use before that date. The actual number of cadets present at the academy is 456, the difference between this number and the maximum being due to deficiencies or failures to enter.

Since the date of Thayer's superintendency the candidates appointed to the Military Academy have had to pass an entrance examination. A law of 1812 provided that the candidates should be "well versed" in reading, writing, and arithmetic. These were the requirements until 1866, when a "knowledge of English grammar, United States history, and geography" was added. No other change was made until after the annual examination of June, 1901. This year, for the first time, candidates who can furnish certificates of graduation from public high schools having a specified curriculum, or who are students in good standing in an incorporated college, may enter without examination; other candidates will still be examined, and for these the requisites for admission have been made to embrace algebra, geometry, general history, English composition, and physical geography. The change from the previous method of admission to that prescribed for the present year is the most radical single change made in the methods of the academy since 1820.

The Academic Board consists of the superintendent of the academy and the heads of the departments of instruction, and corresponds to the faculty of other institutions. The superintendent is charged with the immediate government and military command of the academy, as well as of the post of West Point. The heads of the departments of instruction are ten in number, of whom six are permanently at West Point; the other four, like the superintendent, are detailed to the academy for a period of years. The other officers of the academic staff are the associates and assistants of the heads of the departments in the work of instruction. The military staff is composed of the administrative officers both of the academy and of the post, and at the present time consists of seven officers. The departments of instruction are (1) mathematics, (2) modern language, (3) chemistry, (4) natural and experimental philosophy, (5) drawing, (6) law and history, (7) civil and military engineering, (8) ordnance and gunnery, (9) practical and military engineering, etc., (10) tactics.

The instruction given by departments 9 and 10 is all military and mainly practical, not academic. The instruction of 10 is distributed over the entire course of four years, and that of 9 over the last three years. The instruction given in department 8 is entirely professional; in 7 it is mainly so, and in 6 to a considerable extent; the work of these three departments is confined to the last, or fourth year. Departments 1, 2, 3, 4, and 5 occupy by far the greater proportion of the academic hours of the cadets during the first three years. The instruction in department 5 is in part general, but more largely professional.

Department 2 is more largely devoted to the French and Spanish languages, and may be considered as both general and professional. Department 3 embraces some professional instruction, but it, with Nos. 1 and 2, may be considered to include general scientific instruction, strictly professional only in the sense that it afterward becomes the basis of the higher professional work, and is itself of great disciplinary value. Each of the departments embraces several kindred subjects, so that in the ten departments named there are included forty-one distinct but connected subjects of instruction. The curriculum of studies and the apportionment of time to each is the outcome of the best judgment of the Academic Board, which, under the law, is made responsible for them. This board is aided and influenced by the constant criticism and suggestions of the many able young officers of the army detailed as instructors, of whom about one-fourth or one-fifth are relieved every year and others take their places. The academy too has had the benefit of the investigations and suggestions of the official boards of visitors, who, for eighty years, have annually reported upon the academy.

From this brief outline of the curriculum it will be observed that while the practical military field exercises are given during each year of the course, and a small amount of theoretical military instruction also, by far the greater proportion of the professional information, — that requiring serious mental effort to acquire, — is taken during the fourth year; during the first three years the education is mainly of a general scientific nature, rather than specially professional. The advantage and necessity for this arrangement are due to two facts: (1) The academy was called upon to edu-

cate the great majority of its pupils both *generally* and *professionally*; (2) it has always attempted what no other school has, to educate scientific soldiers for *all* branches of the service.

For practical military instruction the Corps of Cadets is organized into a battalion, which is divided into six companies, and these companies

THE ACADEMIC BUILDING.

into still smaller units, depending upon the nature of the instruction. The academic instruction is based upon the use of text-books, oral recitation, and blackboard discussion and demonstration, with a certain amount of written recitation. The time of a single recitation is either one or one and a half hours. For purposes of recitation the classes are all subdivided into sections: for the one-hour periods the sections contain eight to ten cadets; for the longer periods, twelve to fourteen. By this arrangement marked personal attention can be given to each cadet at each recitation. By

a system of transfers the cadets showing about the same proficiency are kept in the same sections, thus greatly facilitating the instruction. All the cadets take the same subjects of study; but the more proficient, or upper, sections generally take considerably more than the lower. Progress of the individual cadets, as fixed by the system of marking, is publicly posted each week. Every cadet is required to pass through all the studies of each of the four years.

The day for academic exercises extends from 8 to 4 o'clock, with one hour's inter-

THE BARRACKS.

THE OBSERVATORY.

mission,—from 1 to 2. These exercises are so arranged that they do not average over three and one-half hours in recitation room in any one day. The studies of the cadets are intended to be such that the total work demanded of them, including recitations, shall fall between seven and nine hours a day; this is exclusive of the military exercises, which do not require study. The academic term extends from September 1 to June 1, with only three general holidays,—Thanksgiving, Christmas, and New Year. This makes available thirty-seven weeks for academic work, exclusive of examinations. The usual college year, exclusive of all holidays, is seven weeks less. This excess of seven weeks a year makes the West Point course of four years practically equal to five college years of thirty weeks each. This fact is very frequently overlooked in considering the West Point course of four years. Each summer the class whose stay at the academy has been two years is allowed to be absent from June 15 to September 1. This is the only general leave permitted during the four years.

For the same time (June 15 to September 1) the other three classes live in camp, and this period is devoted entirely to military exercises, the three encampments affording seven and one-half months for the purpose.

The result of the academy's work is shown by the records of graduates. General Scott officially ascribed the brilliancy of the campaigns in Mexico largely to the presence of graduate officers. At the close of the great Civil War, all the armies, nearly all the corps, and the greater number of divisions on both sides were commanded by graduates of the academy. The present distinguished Secretary of War has said that the services of the graduates in the Spanish-American War alone has justified all the expenditures made upon the Military Academy. Less

known,—but, under the circumstances, none the less heroic,—have been their services against the Indians of the great West. The gallant, trying, and valuable work done by them, and still in progress, in the Philippines needs no mention. Many of her sons in civil life have brought credit to the academy by their brilliant records.

The academy has turned out 4,067 graduates, not including the class of this year; of this total 6 per cent. have been killed or died of wounds received in action. There are still living 1,914 graduates, of whom 1,409 are on the active list of the army, 187 on the retired list, and 318 in civil life. The proportion of all the officers of the army on the active list who are graduates of the academy is 34 per cent. The total amount expended in the maintenance of the Military Academy to the present time has been a little over \$22,000,000. As at present organized its annual cost is considerably less than that of a cavalry regiment, and the average annual cost of the academy has been considerably less than is that of a third-class modern battleship.

The exercises of the centennial celebration of the academy extended over four days, having been commenced on the 8th by an eloquent and appropriate memorial sermon by the chaplain of the academy. The 9th was designated "alumni day," and was devoted to the reunion of the graduates. Representatives of all the classes, except two, for the past sixty years were present. The aged veterans of the Union and Confederate armies,—who, forty years ago, faced each other in the life-struggle of the nation,—met with the warmest fraternal greetings, and recounted with boyish enthusiasm the experiences of earlier days. The afternoon exercises of this day consisted of addresses, by the president of the Association of Graduates, by veterans of the Mexican War, of the Civil War (Union and Confederate), and of the Spanish-American War. The events of this day would have been deemed impossible a few years ago, and they show how completely has faded the enmity and how mellowed the memories of the Civil War.

The 10th was devoted to athletic field exercises, and, besides contests between the cadets themselves in the morning, included a baseball game with the team of Yale in the afternoon. In the evening the "graduating hop," always a great event for the cadets and young ladies, was held. The older alumni were thus enabled to observe some of the modern forms of relaxation in which cadets indulge.

The 11th was "centennial day," and the scenes witnessed will never pass from the memories of those present. The exercises were opened

by the military reception of the President of the United States, who arrived at 10 A.M. This was immediately followed by a review of the corps of cadets by the President, Secretary of War, general of the army, and many other distinguished guests. Upon the conclusion of the review, Cadet Titus was called from the ranks and decorated by the President with a medal of honor because of his gallantry in being the first to scale the walls of Peking. In the afternoon, the President, going on foot, was escorted from the superintendent's quarters to the Memorial Hall, preceded by the corps of cadets and followed by the representatives of foreign countries and of institutions of learning in our own and other countries, and by all the alumni present. The exercises in the hall consisted of an address of welcome by the superintendent, followed by addresses from the President; from the orator of the day, Gen. Horace Porter, upon the unveiling of the centennial tablet, and by the Secretary of War. The day terminated with a grand banquet, at which were seated about six hundred guests. The addresses on this day and on the 9th were of the highest order, both as to style and substance, and were a credit to the occasion and an honor to the speakers. It is regretted that space only permits three brief quotations.

The President, with all the force and incision for which he is noted, said :

This institution has completed its first hundred years of life. During that century no other educational

institution in the land has contributed as many names as West Point has contributed to the honor roll of the nation's citizens. [Applause.]

Colonel Mills, I claim to be an historian, and I speak simply as a reciter of facts when I say what I have said ; and more than that, not merely has West Point contributed a greater number of men who stand highest on the nation's honor roll, but I think beyond question that, taken as a whole, the average graduate of West Point during this hundred years has given a greater amount of service to the country through his life than has the average graduate of any other institution in this broad land. [Applause.]

Mr. Root, with most impressive deliberation, said :

And, now, at the very time that this great institution of military instruction is rounding out its first century of existence, the attention of our people has been sharply concentrated upon this increased necessity for military learning and military science by the events of the past few years, and the conclusion which has been reached finds expression in the action of the national Legislature, which, in the long run, through long discussion, but with absolute certainty, reaches just conclusions in the end upon all great subjects of public importance. [Applause.]

The conclusion that the country needs the military academy at the beginning of the second century of its existence more than it did at the beginning of the first is expressed by the laws of Congress, which have enlarged the number of your corps, and which have just devoted to the enlargement of the conditions of the Academy the munificent sum of \$2,000,000, to be immediately expended, with authorized expenditures of six millions and a half. [Applause.]

How well you will be able to meet the obligation

Photo by Pach Bros

PRESIDENT ROOSEVELT REVIEWING THE CADETS.

(Gen. Nelson A. Miles on the left, slightly to the rear.)

and to justify this confidence, let the record of the American army of to-day answer. [Applause.]

All honor to the officers of the American army, who, in true republican fashion, have worked their way up from the ranks, as did Chaffee, commanding in the Philippines. [Great applause.] All honor to the officers who, turning aside from the allurements of wealth and honor in civil life, have been appointed as civilians to the army, as volunteers, accepting the slender income and the hard life that is known to accompany the duties of a soldier.

But they will be the first to say aye when I say that the informing spirit, the high standard of the soldier of the American army, is to be found in the graduates, in the teachings, in the traditions of the military academy. [Applause.] Happy augury of the future that here, where, for a hundred years, honor has ever ruled—honor made up of courage, truth, compassion, loyalty—is to be found the formative and controlling power of the American army, of the future regular militia, and volunteer. No army inspired with the spirit of the military academy can ever endanger a country's liberty or can ever desert a country's flag. [Applause.]

These statements may be accepted as the general impressions and conclusions of the country in regard to the military academy, and they make appropriate brief reference to the causes which have produced such gratifying results. The curriculum and methods of the academy have originated and developed under the belief that the profession of the soldier is likely at any time to be full of responsible work, and to need men of character and power; under the belief that the academy should train character and mind as well as inculcate the principles of military discipline; under the belief that ability to use the rational faculties to the best advantage are the highest results of youthful education, far higher than the acquisition of information; under the belief that mental power is better than knowledge, and that such power is only acquired by overcoming difficulties; that training is that discipline which teaches absolute subordination of *inclination* to *effort*; under the belief that, amid the varied and complex conditions of a living world, every new proposition, every specialty is sooner and better mastered by him who has had the training of hard, concentrated mental effort.

The fact that the art of war, in all its highest operations, is but the application of the principles of a science make it imperative that the basis of the curriculum should be scientific. The success of the methods of the academy are universally ascribed to the division of the classes for instruction into small sections, as already mentioned. Thus the daily efforts of each student can be observed, noted, and given the attention and assistance required, and his personal peculiarities studied and corrected when necessary. It is in the close, personal contact of this section-room work that the mental "setting-up" of the cadet is

THE BATTLE MONUMENT.

(Erected by army subscriptions "In memory of the officers and men of the Regular army, who fell in battle during the war of the Rebellion.")

mainly given. During the whole four years each cadet, with from fifteen to eighteen of his associates, is from two and a half to three and a half hours daily in close personal relations with some one of the army officers detailed because of his supposed fitness to act as his instructor and guide. This relation gives ample and excellent opportunity to observe every element and peculiarity of *character* as well as of *mind*, and it is here that the most persistent and constant personal influence operates to give both the right trend.

The courses of study, as well as the methods of instruction, have themselves been developed with the constant view of influencing character as greatly as possible during mental training. The curriculum and method, combined with the opportunity, precept, and example so constantly before them in the section room, are the most potent agents in developing the characters as well as the minds of the West Point cadets. In all military exercises, in all relations outside the section room (except during recreation hours), this same supervision and control, example and precept, are exercised and brought to bear, though to a less extent, owing to the necessity for instruction and observation of larger numbers at the same time. In *all* relations, under *all* cir-

cumstances, and at all times there is cultivated, demanded, and enforced perfect truthfulness, honorable conduct, and manly bearing. Any lack of these essential elements of true manhood cannot be made good by mental distinction, however brilliant.

From the remarks of the Secretary of War, quoted above, it will be seen that the country demands an enlargement of West Point, and that Congress has made generous appropriation for that purpose. This enlargement is made immediately necessary by the increased number of cadets authorized by the last session of Congress and by the new apportionment of the last census. It is hoped and believed by many friends of the army that the number of cadets will soon be further increased; and in the plans for new buildings, under appropriations provided, provision will be made for any future enlargement of the corps. It would seem the part of wisdom to make as full use as possible of this source of military preparation, and while it cannot be predicted, it is the opinion of some of our legislators that the number of cadets will soon be increased so as to insure that at least one-half the vacancies annually occurring among the officers of the army may be filled by graduates from West Point. If such increase can be accomplished while still maintaining the West Point standards of discipline and training, it will be most advantageous for the army; but if such enlargement involves any lowering of these standards, as has been suggested, its advantage will be problematical. In his admirable address on the 11th, Gen. Horace Porter referred to one innovation which has been frequently proposed. He said: "It has been asked, Why impart practically the same education to all cadets, to those destined for the line as well as for the scientific corps? It is because it is believed that the mental discipline, powers of investigation, and accurate methods of thought requisite in solving difficult problems in the higher branches of science are the same qualities which are necessary in planning campaigns against wily savage tribes or conducting battles against trained armies, . . . we train a soldier in science in order that he may have the general powers of his brain fully developed, be able to concentrate his thoughts, to reason logically, to grasp with decision the difficult problems of a campaign, and thus be better prepared to lead men and to gain battles for the Republic." It will be observed that these remarks forcibly reiterate the views of the academic authorities, given above, as to the desired objects of academic training.

There are other innovations against which the academy must be on guard, all inspired by the belief that West Point results can be attained without West Point methods. Some of our friends express a desire to sacrifice mental training and the study of principles to the acquisition of immediately useful knowledge; the lack of the immediate or practical utility of some of the most fundamental studies is often inveighed against; others would transform the academy into a school mainly for teaching greater perfection in the various drills, and other elementary practical duties of a junior officer, at the expense of those studies which have been introduced with a view to mind and character building. These propositions are all met in the statement above of the *raison d'être* of the academy's curriculum and methods; but it should be further remembered that the benefit of principles, and of the efforts to acquire them, will be increasingly felt throughout one's whole professional career; whereas, knowledge,—especially if easily acquired,—though of present utility, can have no growing, and may have no continuing, value. Facts and information are readily acquired at all times, discipline and system at an early age only; the sacrifice of the latter for the former during the academic period would be most unfortunate in every way for the pupils. There is also some danger that athletics, most beneficial when kept under proper control, most attractive at all times, may attain undue and detrimental prominence.

If utility and practicality, the mechanical and physical exercises of the soldier, the non-scientific branches of study, are ever given a preponderating influence in the education of the academy, it is the confident opinion of the writer that the fitness of graduates in all scientific requirements of their profession will diminish, that they will be started upon their careers with less mental strength, with less training of their faculties, with less prospect of equal ultimate development, and with less strength of character.

The academy must ever be ready to accept beneficial change; but it should never forget that honest application, unhesitating work, and faithful drudgery are the only means by which the majority can attain success, and these should be made familiar habits to every graduate. Permanent success does not lie along "lines of least resistance," and for competent officers of the army, the rigorous methods of the Germans are better than the lighter ways of the English, and, in this second century of the academy's life, we should give the weight to the experiences and traditions of the first.

CUTTING COAL—ROBBING A PILLAR. PROPS ON THE RIGHT.

## ANTHRACITE COAL MINES AND MINING.

BY ROSAMOND D. RHONE.

**T**HREE ink blots on the eastern end of the map of Pennsylvania, between the Delaware and the Susquehanna rivers, represent all the anthracite coal in the United States. They cover an area of 488 square miles, and produced last year 53,500,000 tons,—truly infinite riches in a little room. They are popularly known as the Wyoming, Lehigh, and Schuylkill regions. Their limits are so sharply defined that one can pass in five minutes through one of the notches in the surrounding mountain wall and find himself as much out of the “coal regions” as if he were a hundred miles away.

The coal measures lie on a floor of conglomerate rock, which rises about them on all sides like the sides of a basin, and is exposed on the slopes and summits of the mountains surrounding the

coal regions. The coal measures which lie in this basin are composed of alternate layers of rock and coal piled upon each other like the layers of a jelly-cake, in which the thick layers of cake represent the rock strata and the thin layers of jelly the coal beds. The thickness of the coal beds varies from 1 foot to 32 feet, and that of the rock from a few feet to 200. The coal beds are pretty regularly distributed throughout the coal measures, and their presence in a certain place can generally be calculated upon, so that each bed bears its own name.

The theory of the vegetable origin of coal has many advocates, but the last word has not been said. The fossil plants in the coal measures, upon which so much has been built, are not found in the coal beds, but in the slate overlying them,

**COLUMNAR SECTION—SHOWING COAL BEDS AND ROCK STRATA.**

(1,272 feet of rock, 117 feet of coal; 1,389 total thickness above the conglomerate.)

which is not a species of coal, nor of vegetable substance in the process of changing into coal, but rock.

#### THE INSIDE OF A COAL MINE.

The term colliery includes the coal mine, with its buildings and appurtenances; the mine proper is underground. The entrance to it is by a drift, a slope, or a shaft. "Stripping,"—which is quarrying, and not mining at all,—is only possible where there is an outcrop of a thick bed of coal. The strippings are in the Lehigh and Schuylkill regions, where the coal is in the mountain tops. A drift is a horizontal tunnel in the face of an outcrop. It is the cheapest and was the earliest method of opening a mine, but the drifts have long since been worked out. A slope is a tunnel which follows down the dip of a coal bed from the surface. It is largely used in the Lehigh and Schuylkill regions, where the pitch of the beds is steep and outcrops frequent. In the Wyoming region the upper beds were formerly mined by drift and by slope; but these have been pretty generally exhausted, and access to the deep-lying beds is only possible by shaft. A shaft is a well-like excavation, opened vertically from the surface to the bed of coal which it is

desired to work. Its width is the length of a mine car, from 9 to 10½ feet, and its length is governed by the number of compartments and area of airway needed. A shaft 10 feet wide and 24 feet long is common, while some are 13 feet wide and 53 feet in length. Its mouth, as far as the soil extends, is lined with cribbing or masonry, below which the rock forms its walls. Its purpose is to hoist coal, to let the workmen up and down, and to pump and ventilate the mine. Over or near its mouth is built the hoisting and pumping apparatus, and it is divided by timbering into carriage-ways, pumpways, and airways. A shaft is usually located so that its foot shall be in the bottom of a synclinal valley, in order that as the mine is opened up the slope it will drain itself into a sump, and the coal will be sent down the grade to the shaft. The lowest place in a mine is the sump,—usually near the foot of the shaft,—from which the water is pumped to the surface by powerful engines. From the foot of the shaft a tunnel called a "gangway" is opened at the right and left in the coal bed along the bottom of the synclinal valley, and parallel with this and above it runs another tunnel called an "airway." These are connected by short tunnels called "cross headings." The gangway is the highway of the mine; it is permanent, and is heavily timbered on the sides and roof; in it are the mine car tracks, single or double, over which the coal is hauled to the shaft; it is the traveling way through which the men reach their working places, and it is also a part of the ventilation system.

The mining of coal is by the "pillar and breast" system. When the gangway and airway have been driven two or three hundred feet chambers are opened at right angles to the airway,—these are called "breasts." A narrow tunnel, just wide enough to admit a mine-car track, is driven about fifteen feet, beyond which the breast is opened to its full width of from twenty-four to thirty-six feet, depending upon the safety of the roof. The inner end, which continually advances as the coal is taken out, is called the "working face," or simply the "face;" the side is called the "rib." Several breasts are worked together, and at intervals are connected by openings called "cross headings." The walls between the breasts are thus cut into "pillars," whose thickness depends upon the roof. In a dangerous mine the pillars are as thick as the width of the breast,—that is, only 50 per cent. of the coal is taken out. Up the breast, as soon as it is opened sufficiently, is laid a track called a "buggy road," upon which runs a small mine-car, or "buggy." The track follows the development of the breast, and when that is worked out

it is taken up. The process of mining is simple, and the tools are of the rudest. They are pick and shovel, bar, hand and machine drills,—the latter an auger, turned by a crank,—and powder and squibs. The coal is loosened or “cut” from the face by blasting; the pick is only used to knock down loosened pieces from the roof and sides, to break up the largest pieces, and to separate the slate from the coal. The general plan of a mine is that of a vast hall with pillars of coal, and roof and floor of the black slate which lies next to the coal; but its floor is seldom level, and the gangways are far from straight. The breasts may pitch so much that the coal is slid down to the gangway in chutes, instead of being hauled over buggy roads. We have seen that a mine is usually worked up the side of an anticlinal, as the surface of a hillside, while preserving in the main a uniform slope, yet drops into ravines and rises into ridges, so the coal beds bend and wind, and their course is followed by the gangways and the accompanying breasts. The distance that a breast can be worked depends on the vein of coal it follows. It may run to a boundary line; to an outcrop; to an anticlinal, when the bed begins to pitch down and the breasts to fill with water; it may thin out until the rock-roof and rock-floor come together; or it may strike a “fault,” which is such a disturbance of the strata that the coal bed is altogether lost.

The mine described is the simplest form, in which only one bed is worked; several beds are often worked at one time, with entrance at different levels to a common shaft, or they may be connected by slopes and shafts within the mine. The coal region is a vast network of mines, so connected with each other that one may travel many miles underground; and lying above each other, like the floors of a Brobdingnagian apartment house.

The last thing done is to “rob the pillars.” This, notwithstanding its sinister sound, is a legitimate process. While a mine is being worked as much coal is taken out as is considered safe, leaving the pillars, sup-

plemented by props, to support the roof. When a mine, or a portion of one, is worked out, the miners are sent in to take yet more coal from the pillars,—that is, to pare them to the last limit of safety. This work is begun at the farther end, and progresses toward the shaft.

#### THE VENTILATION OF MINES.

The modern system of mine ventilation is perfect; and while simple in method, it is extremely complicated in its ramifications. The air is exhausted at the air-shaft by a fan, and fresh air rushes down the main shaft to take its place. The law requires that not less than two hundred cubic feet per minute be furnished to each person in a mine. The fan,—which is a huge wheel without a rim, and with broad blades like those of a side-wheel steamboat,—revolves day and night. During a strike, when everything else comes to a standstill, two things do not cease to move,—the fan and the pumps, for the stoppage of either would work irreparable injury. (See plan of ventilation.) As the air is drawn out at B, and fresh air rushes in through the gangway, its simplest course would be through the cross-heading A into the airway, as indicated by the arrows. To prevent this partitions are built at

GROUND PLAN OF MINE—SHOWING BREASTS, GANGWAY, AIRWAY, BUGGY ROADS, ETC.

or one air current to cross another, when  
onducted in an air-tight box called an "air-  
x." Each current of air is called a "split,"  
the law forbids more than seventy-five men  
ng in one air-split.

#### MINE GASES.

addition to the smoke of blasting powder  
e exhalations of the men and mules which  
e air, there are several dangerous gases.  
damp" is a light, explosive gas, which  
imes burns with a quick flash; sometimes  
les with terrific force, blowing down walls  
oors, and destroying the elaborate ventilat-  
stem in a moment. It often occurs as a  
ver" or "feeder," which is a jet issuing  
a fissure in the coal; it is apt to be ignited  
miner's lamp, and is usually put out by a  
of his cap, although mines have been set on  
a blower. "After damp," "black damp,"  
choke damp,"—loose names for different  
ounds of carbonic acid gas,—and "white  
" which is carbonic oxide, are all non-  
ammable and non-explosive, but deadly to  
.

is the duty of the "fire boss" to examine  
ine every morning before the entrance of  
en, to see that the air currents are travel-

GROUND PLAN OF MINE—SHOWING SYSTEM OF VENTILATION.

ing in the proper courses, and that there are no dangerous accumulations of gases. Dangerous places are barred across and the word "Fire" written over them.

#### MINING ACCIDENTS.

There are two classes of accidents,—those which damage the mine, and those which injure the workmen. The disasters to the mine are the great explosions and extended falls, which bury the workings in a mass of rock and coal, and render them difficult to reopen; for when the roof is destroyed by the breaking up of the rock strata, it is only possible to hold it up by timbering. Mines are flooded by an inrush of water from abandoned workings in upper beds, and, in the Wyoming Valley, they are often filled with quicksand and gravel from pot holes; but the most serious of all disasters is a fire. There is much woodwork within a mine, and when this is set on fire it ignites the coal. There two ways of extinguishing a fire, by sealing from the air, and by flooding with water. The former is a tedious and uncertain process, as the coal may smoulder for months and burst out afresh on the admission of air. To fill a large mine with water, pump it out, and repair the damage to gangways takes from ten months to a year and a half, and the expense incurred is enormous.

There are two classes of fatalities; the great

disasters, in which a large number of men lose their lives; and the minor accidents, which occur day after day, of which the public takes no notice, but whose aggregate number is far greater than the former. In the thirty-two years since the anthracite mine law was passed more than ten thousand persons have lost their lives in and about the mines; but there have been few great disasters,—the men simply fell out one by one or two and three in a group; and if, as was frequently the case, the victim was a Slav, with no relatives in America, the boarding boss refused to receive his body, saying "Dead Hungarian no good," and the corpse was sent to a medical college for the dissecting table.

There lies before me a fat volume, of almost a thousand octavo pages, which might be called the "Book of Accidents." It is the report of the Bureau of Mines of the State of Pennsylvania for the year 1900, and is made up of the reports of the inspectors of the eight anthracite and ten bituminous districts. The inspectors give detailed reports of each accident, and say that in from 50 to 70 per cent. of the cases the victims lost their lives by their own carelessness. Last year in the anthracite mines there were 411 lives lost and 1,057 persons injured. This loss of life made 230 widows and 525 orphans.

Mine accidents are caused by the explosion or inhalation of gas, by blasting, by fall of roof, or by miscellaneous causes, such as being crushed between cars, falling down shafts, and being kicked by mules. During last year half of the fatal accidents occurred in the "breasts" by the fall of rock or coal.

Here will arise a natural inquiry, — Why, since so much damage results from fire and explosion, are not safety lamps used instead of naked lamps? There is a wide misapprehension concerning a safety lamp. It is not an *illuminating* lamp, but a *test* lamp. The principle of the "Davy" is in every school book of physics. It is that a flame enclosed in wire gauze will not ignite the gas outside of the lamp; but the gas will burn within the gauze, thus disclosing its presence. The light furnished by it is dim; and if the flame is strong enough to heat the wire to a red heat, it will in turn ignite the gas outside, thus becoming an element of danger.

Electric lighting has been tried, and does well in mines free from gas; but in gaseous mines there is too much danger, as a mine is such a rude place that the wire is apt to be broken, letting loose the electric sparks.

#### MINE LAWS.

The body of mine law in the statute books of Pennsylvania may be said to be a monument to

the Avondale victims. The Avondale disaster, which occurred in 1869, was the first of those accidents resulting in a large loss of life with which the country has unfortunately become familiar. The Avondale mine was, compared with the great operations of to-day, a small affair. It was ventilated by a furnace at the bottom of the shaft, the shaft itself, with a tall chimney stack at its mouth, forming the ventilating flue. Over the mouth of the shaft was the breaker, and the mine had no other opening. One morning the furnace draught ignited the timbers which separated the flue from the carriage way, the flames caught in a load of hay which was descending by the carriage, and leaped to the top, where they set fire to the breaker, which burned fiercely for several hours, the mass of ruins covering the top of the shaft. In the mine were one hundred and eight men. It was two days before the imprisoned miners could be reached, the first of the rescuing party falling dead as they plunged into the body of "white damp" which filled the mine. When they were finally found, behind barriers which they had built in a vain attempt to keep out the gas, they were all dead,—not by fire, nor yet by explosion, but by suffocation.

The mine laws provide that no breaker shall be built nearer than two hundred feet from the mouth of the shaft; that every mine shall have a second opening for the escape of the men in case anything happens to the main shaft, and that mines shall be ventilated by fan instead of the inadequate and dangerous furnace. In addition to these radical measures, there are laws regulating to a minute degree the entire management of the mines with reference to the health and safety of the workmen,—such as rules limiting the amount of powder which may be stored in a mine; the distance which a miner's lamp must be kept from the powder, and the kind of oil used in the lamps; rules regulating the working of the breaker, and all other machinery; requiring the operators to furnish props, to fit up wash-houses for the miners' use, to provide stretchers and ambulances, and to use all possible effort to take out entombed bodies. The enforcement of all the regulations is under the supervision of State inspectors.

The latest laws are those abolishing company stores, requiring the operators to pay the men every two weeks on demand, and requiring miners to have certificates. The last law was aimed at the immigrants from Austria and Poland.

#### THE OUTSIDE OF A COLLIERY.

The external works of a mine are but a fraction of the mine itself. A colliery externally is a hole in the ground, with an unimpressive building

over it containing the hoisting and pumping machinery, and near by the breaker, with its attendant culm pile. The breaker is a feature of the landscape,—its size, its uniform black color, softened to gray by distance; its peculiar shape, unlike any other building in the world, and the long hill of refuse called the culm pile, make it an object that challenges attention. A roar of machinery emanates from it; and a cloud of black dust, pouring from a multitude of broken windows, envelopes it and blackens everything in its neighborhood. Its shape follows architectural principles, in that it strictly conforms to its uses. The coal is hoisted to the top of the breaker tower, where it is crushed between powerful toothed rollers; after which it falls into screens graded from fine to coarse; thence it travels through chutes, where the slate is picked out by boys; and, finally, falls into pockets at the bottom of the breaker, and thence into cars ready for the trip to the seaboard.

A breaker is often 100 or 150 feet high, has a capacity of from 1,200 to 1,500 tons daily, and costs from \$90,000 to \$125,000 to build. The culm pile, which is as high or higher, is composed of the dirt and coal too fine for use, and is shaped like a prolonged A tent. Upon the top is a track, on which runs a mine-car pulled by a mule, a small locomotive, or often running by gravity. The culm pile is originally a high trestle with a track upon its top. Through the trestle the culm is dropped until it is filled to the top and spreads out in a long slope on either side. The tracks are extended upon this hill until the culm covers many acres, sometimes so encroaching upon a mining village that houses must be removed to make way for it. The culm piles contain much coal which escaped the scrutiny of the slate pickers, as well as the fine sizes which passed through the screens. It is the

A COAL BREAKER.

habit of the women and children to pick coal from those shining black slopes, and in time of a strike the miners themselves seek the culm piles with bags and baskets. These hills are frequently on fire, and burn for years. At night a burning culm pile is a mass of blue, orange, and red embers, which forms a beautiful spectacle that may be seen for miles. It not infrequently occurs that tramps, seduced by the pleasant warmth of one of these smouldering hills, lie down to sleep upon the culm, and are suffocated by carbonic acid gas.

In the early days of mining, "chestnut" was the smallest marketable size of coal; everything smaller was dumped upon the culm pile. Now since what are called the "junior sizes,"—"pea," "buckwheat," and even "rice" and "bird's-eye,"—are largely used, it has become the practice to work over the old culm piles by the "washeries," where the culm is screened and cleaned by water, so that a large percentage of coal is obtained, although it is of inferior quality, some of it having been mined twenty or even thirty years ago, and having suffered from exposure to the air.

Culm is also beginning to be used for flushing back into the mines,—that is, it is mixed with water and poured into the mines, when it immediately fills the worked-out chambers. After it has become settled, and the water is pumped out, it forms a solid mass, which supports the roof, so that the pillars can be taken out.

#### MINE EMPLOYEES.

The employees in the 363 collieries of the anthracite coal region in the year 1900 numbered 143,826. This is according to the latest report of the Bureau of Mines. The newspaper figures are somewhat in excess.

A breast is generally worked by four men,—

CULM PILE.

two miners and two laborers; each miner calls his partner his "butty," the laborers are also "butties" to each other. The miners have a contract with the operator to work the breast at a certain price per car, the miners to furnish tools and powder, and to pay the laborers. It is their business to cut the coal, to direct the opening and advance of the breast, and to prop the roof. No miner can be employed who has not a certificate; in order to obtain which he must have had two

they work in the breaker as slate pickers. A person of humane instincts cannot contemplate with calmness these children kept out of school and forced to such grim and tedious work. In the great labor parades of 1900 large companies of these children marched through the streets; it was a holiday for them, and, with the exuberance of childhood, which even the hard conditions of their lives could not crush, they were shouting and whistling. They carried banners,

on which were inscribed sentiments like these:

"What our fathers were we will be also."

"Give our fathers justice and we can go to school."

"We need schooling but must work."

"Abolishment of the young slaves."

"Our mothers are up at 5 P. M. (*sic*) to get our scanty meals."

Those poor little banners, with their badly-spelled legends, were not ridiculous but touching, for they revealed a state of affairs that even dwellers in the coal regions are not accustomed to consider.

The miner is the unit of the mine-labor question.

The wage scale, fixed by the car, is the basis of payment. The other labor of a mine,—the opening and timbering of gangways, the laying of tracks, the cutting of tunnels through rock,—is known as "dead work," and is paid for on a different basis,—by the day or by the yard. It is not considered mining at all.

#### NATIONALITY OF EMPLOYEES.

There has been a great change in the *personnel* of the anthracite mine employees within twenty years. Formerly Ireland, England, and Wales furnished the sinew which produced the coal. Many of the men had worked in mines in their native land, lying upon their backs as they plied their picks in the thin seams of the English and Welsh collieries.

After the great strike of 1877 the coal operators, who looked abroad for relief from the power of the labor unions, found a new race of workmen in the peasants of the Austrian-Hungarian monarchy, and the Poles and Lithuanians of the neighboring Russian provinces. To-day the Irishman, Welshman, and Englishman, if he is in the mines at all, occupies a clerical position

CULM PILE IN PROCESS OF BUILDING.

years' experience as a laborer in the mines of the State, and must be able to answer, before the mine examining board, at least twelve questions in the English language pertaining to the requirements of a practical miner.

A miner's day's work is done when he has cut enough coal to fill the cars assigned him by the mine boss. He may do this in three or four hours, when he goes home to smoke his pipe and talk politics, leaving the laborers to load the cars and clean up the breast ready for the next day's work. The miner likes his job,—his place is cool in summer and warm in winter, the hours are short, the labor light, and the element of danger is never calculated upon. It is upon the mine laborer that the hardest work falls, and he receives little more than half as much as the miner.

Of the employees about one-fourth are boys. The law forbids the employment of boys under the age of fourteen inside or under twelve outside a mine. The boys inside drive and tend the mules which pull the coal cars, and open and shut the many doors in the dark labyrinths. Outside

or that of a boss. Most of them have gone into other businesses. Many of the clergymen, judges, lawyers, and business men of Pennsylvania have come from the coal mines. A candidate for governor at the present time was a slate picker in his boyhood. There is no better chance of promotion anywhere than in the mining business,—from slate picker to laborer, to miner, to mine boss, to mining engineer or State inspector, to superintendent of collieries, to operator,—all positions are open to intelligence and industry. The miners and laborers of to-day, brutish and uncouth as they appear, with their old-world customs and their unpronounceable names, are already on the upward trend. They have learned English; they have learned mining; they have become naturalized. The city reporters who swarm into the mining region during strikes, taking snap-shot pictures and writing snap-shot opinions, utterly fail to comprehend the conditions of these foreigners. They see rude, unpainted shanties, barefooted women with gay kerchiefs on their heads exchanging greetings with their neighbors in six languages; they see men and women gleaning their coal from the culm piles; or they peep into bare rooms, whose

one adornment is an Icon or picture of a Russian saint or martyr, and cry, "Behold the poverty of the coal miner!" They mistake these mining villages for "slums." Now, in fact, this apparent destitute condition is a thing of choice, for these people live scantily in order to put their wages into the savings banks, and at present hundreds of them are drawing their money from the banks and going to the old country to live in comfort the balance of their lives. In the old times "pay day" in a mining town was a synonym for a rush of business in the stores; to-day the merchants complain that it brings them little increase of trade from the Slav miners. But not only the Slav villages, but the thousands of comfortable houses in the coal regions, are miners' homes, and the thousands of well-dressed people who throng the streets are miners' families. The present difficulty about hours and wages arises from the fact that there are too many men in the business,—that is, the cost of production is divided among too many employees, and the same is true of the hours necessary to keep up the supply of coal demanded by the market.

THE SEPARATION OF THE TITLE OF THE SURFACE FROM THAT OF THE COAL BEDS.

In most of the world a man who buys a piece of land buys from the "top of the sky to the center of the earth." In the coal regions, as a rule, he buys the surface only, the coal is "reserved,"—that is, it has long ago been sold or leased. The exceptions are those lands which have been kept for higher prices. The owner of a small lot has no object in refusing to sell the coal beneath it, for he knows that the coal operator will mine around it, leaving it as a pillar. Not long ago warrants were taken out for the coal beneath the Susquehanna River and the public roads. The city of Wilkesbarre owns a park the coal beneath which is unsold, and there is occasional agitation about selling the coal to improve the surface.

The question will arise, "Is it not unsafe to live above a coal mine,—does not the earth open and swallow up houses and people?" We answer, Yes and no. On the outcrop, along the foot of the mountains which enclose Wyoming Valley, are many "caves" or "cave holes" 50 or 60 feet in diameter and 20 or 30 feet deep. They have been caused by the break in the roof of a mine in the upper coal bed, when the earth rushed down to fill the hole like sand rushing out of an hourglass. The upper bed has long ago been worked out, the falls have already taken place, and the surface settled permanently, so that at the present time there is rarely a fall. It is a well-established belief that the land is much safer

MINERS IN CARRIAGE DESCENDING A SHAFT.

A GROUP OF MINERS.

after a cave than before. There are strange and grewsome tales connected with the time when these caves were made. A boy was riding a mule on a canter from the mine to the stable when the mule stumbled and the boy flew over his head. He picked himself up and turned around to find himself on the brink of a cave which had opened behind him, and into which the mule had fallen and perished in the crumbling, sliding earth. People have fallen into these caves and escaped through mine gangways into which they opened, and not long since a woman going out in the morning to milk the cow found that a section of the pasture had fallen and the cow was quietly chewing her cud at the bottom of a cave hole. Except at the outcrop, the surface is seldom disturbed. The coal beds lie so deep that entire mines might fall in, and long before the surface would be affected the rock strata would have become fixed in new positions.

#### CONTROLLING THE OUTPUT.

The mines are so vast and the number of employees so great that the possible production of coal is far beyond the demand at the ordinary prices. It is therefore considered necessary to control the output, which is arranged by the presidents of the coal-carrying companies, who own or sell on commission 72 per cent. of the coal and transport it all. They mutually agree to furnish a certain percentage each year as their quota. At the meeting held in January, 1896,

whereat an agreement was reached, on the basis of which the output of anthracite was to be divided as per certain allotments, the percentages were :

	Per cent.

The basis of the present combination of operators and carriers is not made known to the public.

The result of this policy is that the mines, instead of working up to their fullest capacity, work on half or three-quarter time. It would seem to be more business-like to increase the production and reduce the price, especially in view of the competition of the bituminous region, but here arises another consideration.

The business of mining coal is peculiar, in that every pound sold reduces the capital of the operator. The coal beds have a limit, which is already in sight. The coal operator resembles a farmer who should first sell the grass from his meadows, then the sod, and finally the soil. The coal operator has already sold the outcrop, which is equivalent to the grass; and has largely exhausted the upper coal beds, which is equivalent to the sod. He is now working the lower beds; and when they are gone, all will be gone. The time at which the coal fields will be exhausted is estimated at about fifty years. To carry out the agricultural figure, we may call the utilizing of the culm banks by washeries and the reopening of abandoned mines as a sort of aftermath. The policy of controlling the output results in strikes and other disasters, while mining to the fullest capacity would hasten the exhaustion of the coal. These are the Scylla and Charybdis of the operators. The foundation of the coal trust was laid in the years between 1860 and 1871, when nearly all of the three hundred thousand acres of coal lands were bought or leased by the great companies. Coal land is now worth from two to three thousand dollars an acre. As the price rose the companies leased the coal instead of buying the land. Coal leases are drawn on the basis of a royalty per ton of mined coal, which varies from ten to fifty cents. There is also in every lease a minimum clause,—that is, the operators obligate themselves to pay a stated sum per year whether any coal is mined or not. It will thus be seen what an enormous investment the great

corporations have in lands, some of which have lain idle for forty years, and will not be mined for fifty years longer, while the minimum royalty sticks to the lessees like the "old man of the sea." A recent decision of the Supreme Court of the State obliges them to pay the minimum as long as they occupy the land, although they pay for the coal many times over. In addition to this great investment is the expense of opening and keeping in repair the mines, the building of breakers and other machinery, the expenses of cars, mules, and the wages of the men. The item of repairs may mean the rebuilding of a burned breaker or the reopening of a flooded mine, either of which will take the earnings of several years. The profits of five years were spent by one company in draining a "drowned mine;" while another spent three years, at an outlay of one hundred thousand dollars, in overcoming a "fault."

The coal monopoly failed in so far as controlling the coal market was concerned on account of the competition of bituminous coal, whose field is practically unlimited, which is more cheaply mined, does not need to be broken, and bears a universal royalty of only ten cents a ton when mined.

The coal-carrying companies look for relief from the burden of their stupendous investments in the mining business to their tolls as carriers, notwithstanding which some of them have been for a long time on the verge of bankruptcy.

To show what the coal-carrying companies earn in their business I annex the following schedule of dividends paid by them for the past ten years:

	Per Cent.

These,—except the third, fourth, sixth, and tenth,—are known as the Morganized roads.

The Pennsylvania Coal Company capital stock is only \$5,000,000.

#### THE COAL BARONS.

There are two classes of coal operators,—the coal-carrying companies, which we have just been considering, and the private operators. The latter are at the disadvantage which a small business always meets in competition with a great monopoly. The carrying companies charge them extortionate rates and deny them cars until they are willing to allow them a commission of 65 per cent. of the price at tide for transporting and selling their coal.

In view of all these difficulties in the coal business, it may be pertinent to inquire, "Who are the coal barons?"

The term is one of those mischievous titles which arise nobody knows how and are carelessly applied. The popular image of a coal baron is a lord of the manor who lives in splendor while his serfs dig a miserable living out of the dark and dangerous mines. Such a person does not exist; he is a creature of the yellow journals. The persons who come nearest to the popular idea of coal barons are the private operators,—whose workmen, however, have the fewest grievances, and many of whom have paternal relations with their men in the way of maintaining hospitals, schools, libraries, and model tenements.

The officials of the coal-carrying companies are so far away, and their stock is distributed so widely both here and abroad,—much of it in the hands of widows and orphans who do not know what a dividend means,—that they can hardly be termed coal barons. There remain only the landlords of the coal lands. These are the true barons. They lie behind and beneath the coal business; their names are scarcely known to the public; they have no part in the strikes, for whether business is good or bad, the coal royalties go on. Personally they are of the gentlest; widows, children, old men; some of them already straitened in purse by the working out of their coal lands; some of them of great fortune, liberal in public enterprises and in public and private charities. Their benefactions are not limited to their own town or State, and their investments have helped to develop the remote parts of the country.

Acknowledgments are due to A. D. W. Smith, State geologist of the anthracite region, for maps and sections; to Prof. C. O. Thurston, of Wyoming Seminary, for photographs; and to Seward's *Coal Journal* for statistics.

# A GENERAL VIEW OF THE COAL STRIKE.

BY TALCOTT WILLIAMS.

A GREAT anthracite coal strike, laying idle 160,000 men and boys and affecting the profits of some \$1,000,000,000 of capital, is not the simple thing many people think it. In a great street-car strike the strikers are all on a parity. In textile strikes they are of two or three closely related classes of labor. So in railroad strikes. In iron and steel they are of two classes; but of these only one, the skilled laborer, is admitted to the union or seriously regarded, the mere laborer being excluded. Lastly, and most important of all, these are all parts of an industrial machine in which the plant of production is closely geared to the need of consumption.

The anthracite coal mines have three distinct classes of labor,—miners, laborers, and men employed on engines and pumps and as mine bosses. The last class is employed through the year; pumps must be kept going whether mining is in progress or not. Their posts are permanent. The laborers work, as already described, at loading what miners have detached. The miner employs them, and receives in general two-thirds of the proceeds of the joint labor. The contract miner's object is to detach in the shortest time each day the largest amount of coal. Hours do not count with him. If he can gain in 200 days of 4 to 6 hours the wage of a year,—as in 1901,—he is satisfied. Nothing helps him but a *pro rata* advance in the sum paid for "mining" a "ton" of coal. The laborer must work a ten-hour day,—the miner sees to that,—and the laborer has two objects: he is working at day labor in the hope of becoming a miner. This was once easy, when the anthracite output was expanding, and more miners were constantly needed, selected from laborers speaking the same tongue and of the same race as the miners. To become a miner has grown to be hard. The laborer must by law work two years in a mine; he must pass an examination,—stiff for him,—in English, not his native tongue, and he must be selected for a "chamber" by a boss of another race, who prefers miners of his own tongue and stock,—English, Irish, or Scotch. Pay and hours mean less to the laborer than promotion, and a larger share in the joint wage of himself and the miner. Lastly, the men employed on pumps, engines, etc., care nothing for the tonnage, are free from the irregular days of anthracite miners, and are interested only either in reducing hours or increasing per diem pay, or both.

To weld these three diverse and conflicting interests in one union, and get them to strike together, is a remarkable proof of the strong tendency toward organization, and the determination of labor, in large homogeneous bodies of artisans, to trust to the collective rather than the personal bargain. This determination may be wise or unwise. Carried too far, it has dealt English industry a visible blow in the world competition of the day. The tendency exists. It must be reckoned with. No capital, however anxious to receive the largest output at the lowest cost, can wisely disregard it. As in the case of the United States Steel Corporation, it is wiser to accept it, and be guided by it in reaching a yearly standard of wages; but to keep "open" establishments, where men working free from union rules can provide, by the largest practicable output and individual initiative, a standard of product which matches and supplements the union's standard of wages.

The anthracite coal strike of September, 1900, was primarily for miners' wages. *Pro rata*, it advanced the wages of the mine laborers. Promotion having been, for eighteen months, slow during a period of great prosperity and unprecedented output, the laborers last winter demanded a larger proportionate share on the weigh-check or aggregate paid to the miner and the laborer. This plea was disregarded by the union. Had there not been a strike led by miners against operators, there would probably soon have been a strike led by laborers against miners. If the strike of September, 1900, was primarily for miners' wages, the strike now was primarily for laborers and engine men, pumpers, etc., and as to organization primarily for "control."

The coal mined is coal and slate. The coal paid for is coal, alone. Amazing as it may seem, the net coal mined is a matter of guess. The guess is close. It is like all guessing when men guess often, generally accurate. But it is a guess; and being a guess, is at times highly inaccurate. The actual coal mined is at times more than the coal for whose mining men are paid. Nothing could be worse. It irritates men. It loads the company weigh-sheets with the smell and savor of injustice. Like the old charge made for powder, it is a survival which, in the total, works little injustice. But in paying wages, the employer must not only be just,—he must seem just. When the men asked for a net coal weigh-

ing, they asked for something not easily done, costing some readjustment, trouble, and expense, but wise and worth, in reducing a sense of injustice, such loss of a shaving of profit and such increase of clerical force as it might demand. In such increase of return to labor as this brought, the Slav laborer would share.

The demand of the miner's union for an eight-hour day for pumpers, engineers, etc., was intended to give this class of permanent labor a reason for coming out. They hold permanent positions. They had not gained in the previous strike in the same way that the miners had. Being permanent, and an intermission of their labor working a permanent injury to their mines, it has been the unwritten law of coal strikes that a pumper could keep on working in a strike without being a "scab." Calling them out in a strike was like cutting down date trees in Arab warfare. The union could have done nothing without calling out its allies at the pumps; but when it did this, it very greatly embittered railroad managers and operators. Compromise became difficult and conciliation almost impracticable when this extreme step was taken.

With labor, however, consisting of these diverse elements, the union could never be entrenched in full control of the conditions on which it yearly bargained, unless all the labor was organized. The exclusion from the mines of all non-union labor was the final aim of the United Miners' Union. Its representative verbally admitted this at the conference held by the Federation of Labor, and when this was done collision was certain.

Had the miner's union in the past eighteen months exerted the rigid discipline of big well-managed unions, prevented small strikes, and worked for a cheap output, it might have divided capital. But it had not been "recognized." Therefore, its control was often loose. Local unions irritated local operators. In the Reading mines, the proportion of coal mined per miner fell one-eighth. It is part of a bad system of over-manned mines under which miners try to distribute work. Output was reduced and wages increased. The result was that the miners were without the responsible control of a big union, and the railroad managers and operators irritated by small strikes and ready for a fight.

When, at the Federation conference the miners' union was adroitly led to assert, though not as a *sine qua non*, the right to exclude non-union men after eighteen months, with all the difficulties and none of the benefits of a large union, conciliation was impossible. The demand meant "control." On wages, men can bargain. On "control," compromise is so difficult as to be

impracticable. It has been made more difficult in the present strike by three conditions. Anthracite railroad managers and anthracite mine operators are under a grinding competition with bituminous coal. To accept a union of United Mine Workers of America, in which the bituminous workers were two to one, was, they believed, to render it certain that on most issues the management of the union would keep bituminous mines busy rather than anthracite. Anthracite mining greatly varies from mine to mine, and a uniform "scale," as in bituminous mines, is difficult. It cannot be impracticable, for veins as narrow, tortuous, and varying are mined under a "scale" in England. Small strikes, on trivial causes, have been frequent,—too frequent, in the anthracite region. This is partly due to varying conditions. Partly to the habit of an irregular industry in which, working only one hundred and fifty to two hundred days in a year, men do not mind a day's holiday. Partly because organization has been by mines. The great unions make strikes more serious when they come; but they do not go to war about trifles, or stop work because a mine boss has "sassed" a miner, or the two have disagreed on a weigh-check. The frequent strikes in the anthracite region have done much to array operators against any organization.

In these issues alone there was matter for collision, but all else was small by the side of the final facts on each side,—that the union could not keep its men together merely by maintaining the increase of October, 1900, renewed in April, 1901,—as it was, some 40 per cent. of the men voted against a strike,—and that the railroad managers and operators felt that they had been coerced by an alliance between capital and politics, Morgan and Hanna, and humiliated before their miners by the settlement of 1900.

This feeling (and a railroad manager or coal-mine owner is just as ready as any other man to sacrifice somebody else to gratify his feelings) has bred obdurate temper on both sides. It has been deepened by the fatal economic situation of the miner. Under competition, the anthracite plant is one-half larger in mines and one-half greater in labor than the utmost demand of the public. Two-thirds of the mines and two-thirds of the men, run more regularly and systematically, could in spite of the lack of demand in summer, produce the coal cheaper and more profitably, and at a higher individual aggregate average, even if at a lower per diem or per ton than the present system. What the anthracite coal industry really needs is a reorganization like that after the London dock strike of 1889, reducing the number of men but increasing

## THE AMERICAN MONTHLY REVIEW OF REVIEWS

for each. As it is, men who prefer work all the year to working two-thirds of the and often half a day at that, have, by a gradual elimination, been weeded out steadily, and left a large share of men, bred to a habit of regular work and short hours. This one is at the bottom of much fitful irregularity in mines.

And railroad managers, holding public franchises and weighted by public responsibilities, have

clearly no right, as they have all united in doing, to refuse all compromise, conciliation, or adjustment, and simply stop work, letting the public pay the cost in higher coal. They are bound either to reach an adjustment themselves, to let some one else reach one for them, or to reorganize the whole industry on a basis which will reduce the material and moral waste of the present system, where poor mines are worked and men are one-third of the year idle even in a prosperous year.

## THE ANTHRACITE-CARRYING RAILWAYS.

BY H. T. NEWCOMB.

(Editor *Railway World*.)

THE anthracite region of Pennsylvania is traversed by nine railways, all of which are controlled by corporations that are engaged, either directly or otherwise, in the business of mining and selling hard coal. The present condition of the State prohibits grants of mining and transporting privileges to the same corporations.

But the conditions of the supply and those under which it is mined and marketed render the essential identity of interest between the operators and the carriers necessary in order to prevent wasteful duplication of facilities, and to insure the conservation of the product. The result has been the progressive extension of the control of the railways and their allied corporations and the steady disappearance of the independent operators. Those railways whose charters antedate the constitutional prohibition have successfully evaded it by the creation of companies which they control, or are themselves subject to the direction of security-holding corporations that are also owners of the controlling mining property. Thus the Lehigh Valley

Railway owns all of the stock of the Lehigh Valley Coal Company, while the capital stock of the Philadelphia & Reading Railway is owned by the Reading Company, which also controls, in a similar manner, the Philadelphia & Reading Coal & Iron Company. The superficial observer rarely has any difficulty in condemning this union of interest between the producers of utilities of form and those of utilities of place; but the fact is, beyond question, that the development of railway mining has been marked by the abolition of many of the wasteful practices of former years and the introduction of machinery and methods which permit a much more complete utilization of the total supply.

The following statement shows the names of the companies that control anthracite mining and transportation, their present mileage and capitalization, the proportion of anthracite tonnage to their total traffic, as shown by the census of 1890 (the latest date for which such data are available for all companies), and the amount of anthracite marketed by each in 1901:

Name.	Length of line operated.	Capitalization.		Traffic in 1890.			Anthracite shipped during 1901.	
		Stock.	Bonds.	Total.	Anthracite.		Amount.	Proportion of total.
					Amount.	Proportion of total.		
	Miles.	Par value.	Par value.	Tons.	Tons.	Per cent.	Tons.	Per cent.

Virginia.....	1,454	140,000,000	147,527,014	20,597,939	9,571,263	46.47	10,971,007	20.5

\*These figures relate to the New York, Lake Erie & Western, but a portion of the present Erie Railroad. In 1890, the anthracite tonnage of the Erie & Wyoming Valley was 92.87 per cent. of its total traffic; that of the New York, Susquehanna & Western, 69.07 per cent.; of the Chicago & Atlantic, 5.79 per cent.; and of the New York, Pennsylvania & Ohio, 1.54 per cent. All these properties belong to the present Erie corporation.

The figures for traffic in 1890, of course, can but roughly indicate the present importance of their anthracite tonnage to the carriers named. It is certain, in fact, that most of them have greatly increased their miscellaneous traffic, and that the latter is now relatively much more important than it was a decade ago.

The increase in hard coal shipments from the mines, from 1890 to 1900, was from 35,865,174 tons in the earlier to 45,107,484 in the later year, or 25.77 per cent; while during the same years the number of tons of all freight carried by the railways in the group of States to which Pennsylvania belongs increased 55.10 per cent., from 240,576,704 to 373,139,488, and the aggregate freight transportation from 23,236,827,478 to 41,275,547,319 ton miles, or 77.63 per cent. Among the anthracite lines are several of the most important in this group, and they operate approximately 50 per cent. of its mileage.

The history of anthracite transportation has been characterized by successive efforts to restrict the competition of the producers. The capacity of the collieries is considerably beyond that necessary to meet the demand at a profitable price level, and experience has taught that unrestrained rivalry in mining and selling is always the preliminary to inevitable disaster. Dr. Peter Roberts, an authority on this subject, calls attention to the fact that the four bankruptcies of the Reading Railway have each followed very soon after periods of strenuous competition. Yet the conditions which render harmonious action necessary make it very difficult to secure the observance of agreements when they can be effected, and many statutory obstacles make additionally laborious the path toward reasonable profits and industrial order.

During the year 1901 prices were exceptionally stable, and there was a good deal of evidence that some of the worst difficulties of former years had been neutralized. This was undoubtedly brought about, in part at least, by the establishment of very close relations between companies that had previously been, in a greater or less degree, competitors. There was unquestionably some progress toward a real consolidation of interests, but its extent has been exaggerated by the daily press. The principal recent changes were the purchase of a majority of the stock of the Central of New Jersey by the Reading, the distribution of a considerable interest in the Lehigh Valley among several other companies, including some that are not anthracite carriers, and the establishment of relations with the Lackawanna which have made that company less of a disturbing factor in the situation. The Pennsylvania Railroad occupies an absolutely independent position, the Delaware, Susquehanna & Schuylkill is merely an adjunct to the business of Coxé Brothers & Company, large independent operators, while the position of the New York, Ontario & Western and Delaware & Hudson companies is one of relative independence. Corporations are governed by boards of directors, and a glance at the membership of those of the nine anthracite carriers will show how far there is associated management. The total membership of the nine boards is 107, and these places are filled by 88 individuals, 77 of whom serve in but one board each. Of the remaining eleven, one is a member of four directorates, six belong to three, and four to two. The following table presents the facts regarding common membership in these boards:

Name.	Central of New Jersey.	Delaware & Hudson.	Delaware, Lackawanna & Western.	Delaware, Susquehanna & Schuylkill.	Erie.	Lehigh Valley.	New York, Ontario & Western.	Pennsylvania.	Reading.
Central of New Jersey .....	9		3		3	5			4
Delaware & Hudson .....		12			1		1		
Delaware, Lackawanna & Western .....	3		14		1	3			
Delaware, Susquehanna & Schuylkill .....				6					
Erie .....	3	1	1		15	3			2
Lehigh Valley .....	5		3		3	12			2
New York, Ontario & Western .....		1					13		
Pennsylvania .....								17	
Reading .....	4				2	2			8

The foregoing shows that of the nine members of the directorate of the Central of New Jersey three serve on the board of the Lackawanna, three on that of the Erie, four on that of the Reading, and five are directors of the Lehigh

Valley. It will be noted that the directorates of the Pennsylvania and the Delaware, Susquehanna & Schuylkill have no members in common with those of the other companies, while in but one case is there a majority of a board con-

\* In addition to many other places of trust and responsibility.

+ Voting trust certificates.

Obviously, it would be necessary to look beyond the foregoing for evidence of excessive profits. The shares of four of the eight companies for which price quotations are available have never sold for their par value, while two have never paid dividends under their present organization, and two more have only paid on a relatively small portion of their shares. The Pennsylvania Railroad is scarcely to be considered in this connection, because of the comparatively small proportion of its total business borne by its anthracite traffic. The Reading and Erie companies have but recently emerged from insolvency and receiverships; while the Lehigh Valley had, during the recent depression of business, a notoriously narrow escape. A recurrence of the conditions which brought about

these financial difficulties is probably nowhere desired, but it should be understood that the only certain safeguard against them is harmonious and united action. So far as this has been achieved, those in control have not only well served the business and investing public, but society in general as well. The anthracite supply is limited in extent; and the period of its exhaustion, if the most conservative methods are followed, is easily calculable. Separate action on the part of the operators and carriers means wasteful methods of mining, the production of a quantity in excess of that which will sell for prices equal to the real cost of production, and the consequent failure to secure from this wonderful fuel supply the greatest usefulness of which it is capable.

FROM THE REPORT OF THE UNITED STATES INDUSTRIAL COMMISSION, 1902.

# SOLVING THE LABOR PROBLEM OF THE WHEAT BELTS.

BY WM. R. DRAPER.

**T**HE policy of the farmer of to-day is expansion. He is buying more land, increasing the yield, and demanding more helpers.

The farming West is a country gone to wheat. The principal development of the wheat-raising industry of the world for 1902 is found in the United States, Canada, and India, this country ranking first. So far as the American farmer is concerned, wheat has taken the place of corn as the most reliable and hardy cereal. It remains green through droughts that burn up cornfields. The hot winds of Kansas and the long periods of freezing in Minnesota only cut down the percentage of a wheat yield, when corn would be entirely destroyed by a single month of dry weather. There is still another advantage in wheat-raising,—the one which has brought forward this cereal so rapidly in recent years. Should winter have proven too severe for wheat, the field can be ploughed over again and replanted in corn or oats. A destructive frost is seldom succeeded by drought in a single year. Moreover, wheat is more easily handled, the profit is larger, and consequently the acreage is increasing throughout this country.

The average annual wheat crop of the United States is 450,000,000 bushels, of which 400,000,000 bushels are required for home consumption. When the yield is greater, there are additional exports.

The great wheat belt of this country is ever changing. Ten years ago we looked to the Northwest for our best wheat, and the largest quantity of it. To-day the millers of large cities expect from the Southwest some of their best bread wheat. Kansas, Oklahoma, and Nebraska are acknowledged wheat-producing sections. Last year, Kansas produced one-ninth of the wheat crop of the United States; Sumner County alone raised 1 per cent. of the entire crop of the world. Oklahoma raised 5,000,000 bushels of wheat in 1896, last year more than five times that amount. For three years Kansas has been in the first rank of the wheat-raising States. Despite the severe drought of 1901, Kansas produced 90,000,000 bushels, for which she received \$50,000,000. Corn averaged less than one-fifth of a full yield, which discouraged the farmers; and last fall 1,000,000 acres of corn land were sown in wheat. Prior to that

the corn acreage had been almost double. Last spring, because of the serious frosts of the winter, 1,080,709 acres were again ploughed up and have been sown in corn. Thus only 82 per cent. of the wheat remained in the ground, and this should produce 74 per cent. of a full yield. This means about 90,000,000 bushels of wheat to be gathered in the approaching harvest. These large and increasing crops have encouraged the farmers to enlarge their fields devoted to wheat.

In the past five years the wheat acreage has been doubled in Kansas, Oklahoma, and Nebraska. With the increase in yield, there is a demand every summer for extra help in the harvest season. Farmers who own the land, or can secure a lease, sow from two to five hundred acres. The farmer with one hired man, four good horses, and a gang plough and drill can do this; but to harvest the crop requires seven men, ten head of horses, and an extra woman in the kitchen to assist the housewife.

Importing labor into the wheat belt during the period of harvesting has caused a new and serious problem to the grower,—that of obtaining the extra workers at the right time and at reasonable prices.

This is the era of large wheat fields in the prairie West. There are many places in Kansas where one can stand upon a knoll and count from eleven to fifteen quarter-sections in one field. The harvesters employed by one man often number a hundred or more. The labor problem of a community given over almost exclusively to wheat-raising is made more complicated from the fact that few if any laborers from the towns can go to work in the harvest fields. Abundant crops infuse the towns as well as the country with prosperity and bustling life. The towns boom while the farmers are gathering in their crops, and there is demand for every idle townsman. As few farmers employ more than three helpers the year throughout, a supply must be imported from outside the State. Kansas boasts of being the only community where a small army of harvest "hands" are imported annually, to the satisfaction of both the farmer and the laborer. Indeed, the plan is quite new to the Sunflower State.

David W. Blaine, a farmer and implement dealer of Pratt County, commenced three years

ago to work upon the harvest labor problem. It was a difficult task,—the correct solution of supply and demand as applied in a great wheat field where the yield is ever changing. He knew he could not depend upon the number of acres as a basis by which to secure a certain number of workers. For two years he found his efforts failed in many particulars. The number of men, women, and teams needed could not be ascertained, as the means adopted for making the estimate proved unreliable. The difference of opinion as to whether Kansas needed one or five thousand helpers proved a drawback in getting laborers to come West. Many did come and found no work, the community in which they arrived being oversupplied, while perhaps in a more isolated section the farmers were anxious for any kind of assistance. Mr. Blaine then decided upon an innovation.

Last year Mr. Blaine sent out reports to the county assessors, asking them to call a meeting of the farmers about three weeks before harvest, and to inform him of the needs of each community, taken as a whole. The prospects at that time were not flattering for a good yield, but favorable weather until harvesting was actually begun deceived even the expert crop reporter. Mr. Blaine's agents had asked for 15,000 men, 3,000 teams, and 500 women. He advertised accordingly. Instead of asking the men to come directly into the wheat belt, he advised all to go to Kansas City, where the Missouri-Kansas free employment bureau accepted the task of distributing them as best it could. Mr. Blaine sent in his reports as to the demands of each farmer. Even this thorough canvass of the situation was insufficient to save all the grain sown.

As early as March 1 of the present season, a circular was sent to the assessor of each township in Kansas, asking him to obtain and file with Mr. Blaine the name of every wheat-grower in his section, the number of acres he had sown last year, the number of extra men, women, and teams he used then, the acreage this year, and the prospect for a full yield. This information was arranged in tabulated form, as follows:

John Jones, Attica township, Sedgwick County, 300 acres in wheat last year, eight men, one woman, and five teams used; 400 acres this year, prospect good.

Mr. Blaine keeps careful record of the condition of wheat in each section until within a week of harvesting, when he sends in his reports to the employment agencies. Thus, if wheat was reported 74 per cent. good in April, Jones would need seven extra men; if 90 per cent. good, he would need eight; if 60 per cent. good, six, or even five would be sufficient. The State

Secretary of Agriculture makes frequent reports on the condition of wheat as it nears the cutting season, thus affording ample opportunity for correction. Free employment bureaus have been established this season at Kansas City and Topeka, while several small towns in the midst of the wheat belt will be used as distributing points.

Wheat-growers pay the laborers from \$1.50 to \$3.50 a day. Some, more expert than others, earn \$4 a day. The cost of harvesting an acre of wheat is divided as follows: twine, 25 cents; ploughing and harrowing, \$1; drilling, 40 cents; seed, 50 cents; cutting, \$1.25; hauling, \$1.50; threshing, \$1.75; total, \$6.65. If sold at 60 cents a bushel, the farmer doubles his money. Machinery saves much to the farmer, but the day laborer yields him even a greater profit. A binder will cut 15 acres a day. The twine costs 25 cents an acre, the binder driver is paid \$1.50, and the hire of the team is \$2.50. In some sections the header is used instead of a binder, thus eliminating the cost of twine.

The total expense in cutting 1,000 acres is \$600, of which \$410 goes for horse hire and twine. However, the farmer pays larger wages to those who do the harder work of the harvest field. The binder driver sits under a sunshade, riding upon his machine. His work is frequently given to young women when there is a scarcity of men in the field. Those who shock the bundles of grain, tramping through the wiry stubble all day long, are paid \$2.50 a day. Stackers and haulers earn a similar sum.

Correctly arranging a stack of wheat or oats, so that the top will turn rain and preserve the under portion, is an art within itself, requiring seasons of hard work to understand and learn. There are those harvesters who can build a stack of wheat requiring the strength of a cyclone to overturn, or the hardest of rainstorms to penetrate six inches beneath the straw covering. In these days few farmers stack their grain; most prefer to haul it directly to the thrasher from the shock. As the thrasher often fails to arrive for weeks after the grain has been cut, the shocker must understand his work quite as well as the stacker.

Helpers about the threshing machines are paid from \$2.50 to \$4 a day. Feeders are paid \$4, but their work is dangerous as well as tiresome. They stand for hours in front of the separator, pushing grain-laden straw into the rapidly revolving cylinders, when at any moment a steel tooth may become loosened and fly out, dealing certain death. To keep the mouth of the separator filled with straw, and the straw uniform in its entrance, so as not to jerk the machinery, never stopping from sunrise until mid-day, is a trial of

mind and body that few can endure. It is the hardest labor of the harvesting.

Wheat fields naturally ripen in the southern regions first, the ripening process traveling northward at the rate of twenty-five miles every twenty-four hours. Harvest helpers are, therefore, sent to the southern fields before others are supplied.

Harvest employment bureaus are conducted after the plan of any free labor agency. The men in charge have the name of every farmer and a statement of his needs. After first demands have been supplied, the second call for workers is filled. There are always many inexperienced harvesters who cannot stand the fatigue, the heat, and the ceaseless moving about demanded of them. Men of every class seek work in the vast fields of the Southwest. There is the tramp on his summer's outing, the clerk taking a remunerative and healthful vacation, business men and college students seeking novelty and recreation, to say nothing of the majority who are hard workers from the cities and farming sections not demanding their prowess.

Railroads running into the wheat belts grant a half rate to the harvesters, the Santa Fé having been the first to offer assistance of this kind.

These harvest excursions are crowded for weeks before the actual work begins. The cutting of wheat begins early in June, and lasts until mid-July. An industrious and steady worker can earn \$125 during a season. The women who come into the wheat belt are generally wives of those laboring in the fields, although many a girl who toils in a village store at \$3 a week will accept employment as a binder driver, or even as a hauler or shocker.

Prior to the establishment of the harvest employment system in Kansas thousands of acres of grain ripened and moulded before the owner could center his smaller forces upon the field. As a field of wheat ripens thoroughly in from three to five days, to permit it to stand after that is extremely dangerous.

The possibility of strikes has been almost obviated through the system inaugurated in Kansas. Last year, near Salina, several hundred men went out, and for one day the owners looked across deserted fields. By the following morning the Kansas City employment bureau had supplied the vacancies. However, even one day's idleness in the midst of a harvest might cause thousands of dollars' damage to over-ripe grain.

## THE EMPRESS DOWAGER'S SYSTEM OF MODERN COLLEGES FOR CHINA.

BY ROBERT E. LEWIS.

(Secretary Young Men's Christian Association, Shanghai.)

HER MAJESTY, TSU HSI, has issued a series of edicts completely upsetting the hoary educational system of China, and substituting in its place modern colleges and schools in all the county seats, the prefectural cities, and the provincial capitals. A preface to succeeding decrees showed that the Empress Dowager took herself seriously, and it would be dangerous to trifle with the reform measures which continued to be indited by the throne.

The literary men of China were startled to read in their papers an edict "commanding the abolition of the Wen-chang in examinations for literary degrees" and substituting "essays and articles on modern matters, and Western laws, constitutions, and political economy!" This edict affects this year about one million civil service students. The ancient system of military education was abolished, and warning was given that "modern military academies in the various

provincial capitals" were to be established. The old system of practicing on the bow and arrow, or with the broadsword, or with stone weights, was acknowledged as "not of the slightest use in turning out men for the army." A flutter of excitement passed through the celestial army corps when this edict was promulgated.

The vermilion ink was scarcely dry on a succeeding yellow decree when it was handed to the telegraph operator at the ancient capital, who notified the Chinese world of a still greater innovation. The proclamation read:

I, Tsu Hsi, etc., etc., command all existing colleges in the empire (Confucian and Buddhist) to be turned into schools and colleges of Western learning. Each provincial capital is to have a university like the Peking University, whilst the colleges in the prefectures and districts of the various provinces are to be schools and colleges of the second and third classes.

I shall not forget the amazement on the faces

of Chinese students as they read this proclamation, discussed it in undertone, and then turned to ask the foreigner if it could be true. Was it to be taken literally? Would it be countermanded? Why should the Dowager Empress now issue similar decrees to these, for which in 1898 the Emperor Kwang Hsu was dethroned?

Her Majesty, Tsu Hsi, has pronounced special honors upon Chinese who should be sent abroad "to study any branch of Western science or art, best suited to their abilities and tastes; so that they may return in time to China and place the fruits of their knowledge at the service of the empire." "The various expenses of the education abroad of the students shall be paid by the viceroys and governors of the young men's native provinces, on account of the imperial exchequer."

These proclamations were in general terms, and the native journals were busy discussing the ways and means for their practical execution when the way was unexpectedly cleared by vermilion decrees of much definiteness. The hand of Dr. William Hayes could be seen as one traced out the new scheme of education. He resigned the presidency of the Presbyterian college at Tungchow-fu, in Shantung, a few months ago, to accept the presidency of the new government university at Chinan-fu, the capital of Shangtung. As there were no preparatory schools to act as feeders for this institution, or for any modern college in China, Dr. Hayes drew up a working plan of grammar and high schools for the whole province, and submitted it to His Excellency Yuan Shi-kai, who recognized that the scheme was the work of an experienced educator, and embodied it in a memorial to the throne. The Empress Dowager consulted with the Cheng Wa Ch'u (board of government affairs at Peking), and then sent copies of the Shangtung school programme to all the governors and viceroys.

Yuan Shi-kai's (Dr. Hayes') recommendations were shortly declared to be the law of the land, and all "viceroys, governors, and literary chancellors of the provinces are therefore to obey the regulations above suggested." This plan provides for grammar schools and high schools in each province, who should pass their studies up into the Provincial University, the graduates of which are to be entitled "students of superior class," or B.A.'s. These Bachelors may then go up to Peking to study in the Central University; and upon attaining proficiency, by imperial decree, they shall receive the Chu jen, or M.A.

Those Masters who pursue further studies at Peking, and who are recommended by the Board of Rites, will be granted the Chinshih, or Litt.D.

Those Doctors who desire to carry their work

further, after the preparation, shall be examined "in one of the throne halls, after which the successful candidates are to be introduced to the throne, when either the grade of Hanlin Bachelor, or secretary of the Six Boards, or secretaries to the cabinet ministers will be bestowed upon them."

This broadside of reform edicts fired into the camp of the conservatives by order of the supposed chief reactionary has certainly upset the calculations of the wise men. None are more surprised than those who have argued that the occupation of China by the foreign military and the missionaries had permanently alienated the Chinese from all things Western. The exact opposite is true. Missionaries are being besieged for help and instruction by the upper class of Chinese. A gentleman who has recently settled in the north of Anhui province writes me that he is burdened by the kindness of the literati, one hundred and fifty or more of them having called on him,—some of them three times in succession,—before he was able to return their calls. Requests for the opening of Young Men's Christian Associations for the literary classes have come from several great student centers. In Shanghai, through the work of this association, sixteen of the student class are ready for baptism, and thirteen others are preparing themselves by special Bible study. The governors of five different provinces have officially turned to missionaries to seek guidance for their new school system. But missionaries are precluded, at present, by a strange fatuity, from rendering assistance. Into the system outlined by Dr. Hayes for Shangtung, and applied to the whole empire by the throne, there was introduced by the Chinese a regulation which requires that the Chinese professors "shall, on the first and fifteenth of each month, conduct the classes in reverential sacrifice to the Most Holy Teacher Confucius, and to all the former worthies and scholars of the provinces." This regulation makes it impossible for Christian students to remain in government colleges. It is not only plainly contrary to the religious liberty guaranteed by the treaty of Tien-tsin, but is especially short-sighted, in view of the fact that practically all the ablest students and teachers connected with government colleges are Christians. The whole Christian student body has refused to conform, for by conforming it would return to heathenism. The non-conformists have the sympathy of many enlightened mandarins; and if they and the missionary educators who are needed by the government to man its colleges remain firm, the question of religious liberty in educational circles in China will be settled for all the future.

# TWO FRENCH PREMIERS: WALDECK-ROUSSEAU AND HIS SUCCESSOR.

BY OTHON GUERLAC.

## I.—M. WALDECK-ROUSSEAU, LAWYER AND REPUBLICAN STATESMAN.

TOWARD the close of the year 1880, when the great orator Gambetta was president of the French Chamber, there appeared, one afternoon, in the tribune a young deputy from Brittany, phlegmatic of countenance and slender of figure, with an appearance of aristocratic elegance not usual among the representatives of the democracy. All that was known of him was that he was a lawyer of a certain reputation in his district, and that he was one of the favorite disciples of Gambetta, at that time the leader of the Opportunist party. As he began his address, it could be remarked that the presiding officer leaned forward in his chair, in a manner not merely curious but almost paternal, as if to miss no detail of this first parliamentary effort, in which he had so personal an interest. His fears, if he had any, were soon dispelled. The young Breton lawyer spoke with the ease, the confidence, and the finish that distinguish the born orator. He had not proceeded far before Gambetta was seen to settle back in his chair, reassured and beaming, while the Chamber abandoned itself to the rare pleasure of listening to a real master of eloquence.

The young orator of 1880 was M. Waldeck-Rousseau, the man who, under conditions unique in French history, at the very moment when his work had been endorsed by the voters of the nation, has resigned the prime ministry of France. His policy,—or, rather, his personality,—was the issue in the general elections to the Chamber which have been held this spring. For three years he has managed the affairs of France, having exceeded in his tenure of office all the previous ministers of the third Republic. During this period his ministry has been subjected by the parties of the opposition to persistent and violent attacks, from which he has always emerged victorious, thanks to his oratorical talents, his parliamentary dexterity, and his personal prestige. His qualities of leadership and the great authority which he has acquired have enabled him to hold together and to keep in hand one of the most turbulent majorities and most difficult to satisfy that can well be imagined,—a majority of Radicals and Socialists. And

he is not only one of the leading statesmen of Europe; he is also one of the most attractive and most interesting figures in public life.

M. Waldeck-Rousseau was born in Nantes, December 2, 1846. His father, a Breton lawyer, was an old Republican, who had played a part in the Assemblies of 1848, had opposed the Empire, and had been, under the Republic, elected mayor of the important city of Nantes; throughout Brittany he had won for his name the respect of men of all parties. The son, after finishing his legal studies, began practice at Saint-Nazaire, and then at Rennes. His success was immediate and startling. It is related that in one of his first cases his adversary, one of the most noted lawyers of the time, a veteran of the profession, was so astonished at the talent displayed by his young rival that he began his reply with the prediction that this was to be one of the great orators.

In the Chamber of Deputies, of which he was elected a member in 1879, he did not long remain inactive. Gambetta, who was assiduous in attracting young men to his standard, had detected in M. Waldeck-Rousseau a promising recruit. Moreover, the great orator from the Midi,—warm-hearted, exuberant, and fervidly eloquent,—was strongly attracted by the cold and elegant young Breton, so different in every way from himself. He accordingly enlisted him in the ranks of his followers; and when, in 1881, he formed his first ministry (popularly known as the "Great Ministry"), he chose this deputy of thirty-five to be his Minister of the Interior. The "Great Ministry" did not remain long in power, but it lasted long enough for M. Waldeck-Rousseau to make himself remembered. In a circular letter to the prefects of the departments, dated November 24, 1881, he vigorously attacked the French patronage system, which transformed the legislators into perpetual solicitors of places for themselves and for their friends. He declared that he would refuse to receive letters addressed to him by deputies to recommend applicants for places. This act of energetic independence was resented

deputies, and contributed to the early fall of Gambetta's cabinet on January 26, 1882.

This incident had sufficed to make M. Waldeck-Rousseau known as a man fitted to govern, and endowed with courage as well as ability. Consequently, in 1883, when Jules Ferry, another good judge of men, formed his ministry,—one of the longest in power and most important in the history of the third Republic,—Waldeck-Rousseau was again chosen for the portfolio of the interior. During the two years in which the Ferry ministry was compelled to meet the continual attack of the reactionary-Union coalition, Waldeck-Rousseau assisted in defending the principles of republicanism, bringing to the support of his chief's vigorous and almost brutal eloquence the resources of a formidable dialectic, whose chilling directness was only the mask of the keenest wit and epigram.

Then, in March, 1885, as the result of an insurrection in the Tongking war, the Ferry ministry lost power, M. Waldeck-Rousseau withdrew almost completely from active participation in politics. For four years he retained his seat in the Chamber, but almost never took part in discussions, except on one or two occasions, when he aided the Moderate Republicans in their attacks upon the Radical ministry of Floquet. He returned to the bar, where his great name and his splendid oratorical talents assured him one of the best places in his profession. In 1889 he did not run as a candidate. Instead, he utilized the experience he had acquired in public affairs in mastering the difficulties which presented themselves to him in his legal practice. There was no great industrial case, no great industrial litigation or important civil process, in which he did not play a part.

His intellect,—logical, clear, and penetrating—was not baffled by the most difficult complications of finance or jurisprudence. Moreover, he avoided the dryness inherent in such subjects by his lucid explanations and applications drawn from his practical experience and his knowledge of men and affairs, and by that delicate irony which illumined all his utterances, and which, added to the charm of an impeccable style, makes each of his arguments in court a work of art delightful to the ear and to the intelligence. He acted as counsel for the government and for the Bank of France; he defended the interests of Coquelin in the suit brought against him by the Comédie-Française; he defended the millionaire spendthrift Lebaudy against his family, who sought to have the courts appoint a trustee for his estate. In December, 1898, as lawyer for one of the defendants of the now world-famous Madame Bert, he was the first person to declare in

court his conviction that the Humbert-Crawford litigation was fraudulent. On one occasion I heard him make an argument in a financial case in reply to his recent colleague, himself a brilliant lawyer, M. Millerand. The two speeches, so unlike in tone but so equal in ability, were characteristic of the two adversaries,—the one speech calm, measured, and courteous; the other sharp, aggressive, and bitter. But his great case,—the one which did the most to spread his name, and in which he is said to have received a fee of \$25,000.00,—was the Panama case, in which he defended the famous engineer Eiffel, the designer of the Eiffel Tower, against the charge of having swindled the Panama Company by false estimates of the amount of work performed by the contractors. His argument, which was delivered before a crowded court room, occupied several sessions. Amid the intricacies and technicalities of the points at issue he seemed to be a master of engineering as well as of finance. And at the conclusion of that long effort, he delivered a peroration, received with great applause by his listeners, but often quoted against him since, in which he called upon the court not to make an example of men who, like De Lesseps and Eiffel, had contributed by their achievements to the fame and influence of their country, and who (to use his own words) "*avaient fait à la grande humilité de 1870 l'aumône d'un peu de gloire*,"—"who had given of their fame to France as one gives alms to the unfortunate." I can still recall the picture of M. Waldeck-Rousseau, after that great speech, passing through the corridors of the Palais de Justice, followed by his admirers.

M. Waldeck-Rousseau's successes and increasing reputation caused his friends in the Republican party to regret keenly his retirement from politics. His absence was felt all the more because the former leaders of the moderate wing were by this time either dead, like Jules Ferry, or discredited and without prestige. In 1894, the Republicans of the department of La Loire took advantage of a vacancy in the Senate to elect M. Waldeck-Rousseau, without his solicitation and almost in the face of his opposition. But he was too faithful to his party to avoid what was represented to him as his duty. He took his seat in the Senate, but abstained from speaking and took little part in actual politics except when practically forced to do so by the members of his party, who called upon him for stump speeches during the campaigns. It was thus also that, in 1895, he consented to the use of his name as a candidate for the Presidency of the Republic. He was defeated, however, by Félix Faure, whose mediocrity appealed more strongly to the Electoral College. But M. Waldeck-Rous-

seau's real period of activity began with the crisis of the Dreyfus affair,—that disturbance which upset all parties, and seemed for the moment to be endangering the Republic itself. M. Waldeck-Rousseau, like the majority of sensible and liberal French statesmen, was in favor of the only normal and logical solution of the difficulties which the case presented,—an immediate and fair revision. When the Dupuy ministry proposed to take the case out of the hands of the Criminal Chamber of the Court of Cassation, M. Waldeck-Rousseau delivered his first great address in the Senate, and produced a profound impression. From that moment on he threw himself into the struggle, and took a foremost part in it, no longer with that air of skeptical indifference which had sometimes been attributed to him, but with the conviction and the energy of the patriot and the statesman. It was in June, 1899, at the very crisis of the affair; the nation was divided into two hostile factions; the long-cherished animosities threatened to break out in open violence; the army seemed to be hesitating, and the destiny of the Republic seemed to depend upon the chance of some general's momentary wavering from discipline or of some excited agitator's hazard of fortunes. The Dupuy ministry had just collapsed, and no one seemed disposed to accept the responsibilities of power at that critical period, when Dreyfus was just about to return and his case to be retried. M. Loubet appealed to the devotion and spirit of self-sacrifice of M. Waldeck-Rousseau. If the latter had listened only to his personal interests, to his fondness for studious retirement, and to his disdain of political ambitions, he would have refused. But he saw a difficult task to be performed and a great responsibility to be undertaken. He accepted. He decided to appeal to all parties, even the most extreme, to come to the defence of the Republic. He brought together in the same cabinet a general of whom he was sure, from reasons of friendship and obligation, and a Socialist whose ability and worth he had seen tested in the tribunals of justice. He formed that ministry of June 22, 1899, in which were united men as different as General de Galliffet, the Deputy Millerand, the Moderate Republican Decrais, and the young Socialist Baudin.

The Opportunist party, in which up to that time Waldeck-Rousseau's friends were all to be found, split into two parts; one, the smaller, endorsed this bold stroke, which seemed to them warranted by the situation; the other, led by M. Méline, to whom was soon added M. Ribot, refused to follow him in this seemingly precarious venture. The Radical party, for the most part, and the more judicious element of the

Socialist party, rallied to the defense of the new ministry, which came to be known as the "Ministry of Defense and of Republican Action." With this heterogeneous majority, to which the "advanced" parties made the largest contribution, Waldeck-Rousseau, the former Conservative Republican, only yesterday the best authorized spokesman of the Opportunist party, succeeded in governing France for the last three years.

That he has been compelled to sacrifice to that majority some of the features of his own programme; that he has been obliged to comply with the exigencies of the advanced party, instead of carrying out the wishes of the moderates; that he has been forced to move in the direction of radicalism, and to accept certain measures of an almost socialistic character, this cannot be denied. But his work, as a whole, has been of the most fruitful character, and is worth summarizing.

In the first place, he has reestablished peace,—in the material and in the moral sense,—in the thoroughfares of Paris and in the hearts of most Frenchmen. The time is past when President Loubet could be insulted by ruffianly Nationalists in Paris, or assaulted at Auteuil by aristocratic Royalists or Bonapartists. The Dreyfus affair has been closed by a compromise, the only means which could have been peaceably employed; Dreyfus has been pardoned. The amnesty has been voted after a splendid speech of the prime minister, which the Senate caused to be posted in all the communes of France.

Further, he has succeeded in passing a certain number of measures which had, for a long time, been only unrealized projects. In the first place, he has created a colonial army, the need of which had been felt for twenty years.

Another law has been passed making the inheritance tax less burdensome on small estates. Still another law has reduced the excise taxes upon wine, beer, and cider (what are called in France "hygienic beverages"), and increased that upon distilled liquors, a measure which aims at both the welfare and the morality of the masses, inasmuch as it makes cheaper the wine upon the workingman's table and at the same time tends to decrease the consumption of the really dangerous alcoholic drinks.

The law which, beyond all others, has occupied the attention of M. Waldeck-Rousseau's government, and which has been the most exhaustively and passionately debated, is the law dealing with the associations, which received the President's signature on July 1, 1901. This law establishes and regulates the right of association, hitherto refused by the law, to groups consisting of more than twenty persons. The feature which gives

with a peculiarly aggressive character, and has called forth the protests of the Roman Catholics and of a great number of Liberals, it makes the existence of the religious association dependent upon the good will or the caprice of government, which has utilized it to prohibit the existence of societies accused of taking part in politics, such as the Jesuits and the Assommoirs. It must be admitted that the very existence of a ministry supported by the Radicals is conditioned upon its adoption of a policy, if not hostile, at least defiant with regard to Catholicism.

In the law of associations, M. Waldeck-Rousseau has made this concession to anti-clericalism. In return he was not expected to prohibit certain further articles of the Radical programme, which he always opposed, such as the income tax, the abolition of the Senate, and the separation of Church and State.

The bitter complaints of the conservative press, which reproached his administration with making dangerous concessions to the anti-clericals, with being only a tool in the hands of the Radicals, with endangering national safety, and with national credit, M. Waldeck-Rousseau replied by citing the social and political reforms which he has brought to pass, by pointing to the peace and order reestablished in the country, and to France's worthy maintenance of her position as a great power in the European concert. His actions of April 27 and May 11 have shown the country at large indorsed this policy.

The great source of M. Waldeck-Rousseau's success during his three years of office, was the force and magnetism of his personality; this, rather than anything else, enabled him to maintain discipline and loyalty in the ranks of his majority. Waldeck-Rousseau is cold in temperament; in the midst of turbulent parliamentary storms he is collected, always master of himself. He has never been called haughty and contemptuous. He is indeed, reserved and somewhat distant; but not the vulgar familiarity of the ordinary politician, for he has a species of dignity due as much to timidity as to good taste. In fact, his reserve is timidity in disguise. On one occasion when a lady of his acquaintance went to him to make an argument at the Palais de Justice, he confessed to being greatly disturbed, and said to her, at their next meeting, "You were near ruining my logic; I do not like to argue before my friends." This great orator is a great master of silence, who wastes words neither in public nor in private. He has no need for notoriety or display. He is anxious to escape from celebrations, receptions, and dinners as some are to participate in them. I have said that it was necessary to place him in

the Senate almost by force, after his temporary retirement from politics. Since he has been prime minister, he has declined all invitations,—except in cases where he felt it his duty to encourage some charitable or humane enterprise. Beneath his cold and unsympathetic exterior he conceals the warmest and most generous of hearts. His colleagues in the cabinet dearly loved him. When they met for the last time, after three years of unbroken union and friendship, there were tears in all their eyes.

For relaxation from his work, in which he expends his energy without stint, he turns to painting in water colors, being reckoned an amateur of distinction, and to angling, which he once declared to be the one thing for which he felt himself best fitted. Highly cultivated and well read, he is also fond of travel; the Italian cities, especially Venice, have a strong attraction for him, whenever his duties do not keep him in Paris. Sometimes, in vacation, he spends long periods at sea, on board the yacht of one of his friends. He was on one of these cruises when, in the summer of 1901, the arrival in France of the Czar was announced. While the other ministers were rushing about in feverish excitement, and lavishing themselves upon preparations and arrangements, the prime minister tranquilly continued his voyage until it was time to return to the shore; then he returned, and received his imperial guest with his accustomed quiet ease.

His engaging manners impress all who come into contact with him. His charm and perfect distinction have won the admiration of the entire diplomatic corps. The German ambassador once said to him: "What a pity that my master cannot make your acquaintance."

M. Waldeck-Rousseau's chief means of influence and his supreme fascination is his eloquence. I have often heard him speak, upon the most widely differing subjects, and always, however dry the question under discussion, the charm and the pleasure have been the same. His eloquence is, above all, modern, discarding idle ornament and antiquated rhetoric. There are no tall phrases or showy metaphors, but there is precision, clarity, and logic. His reasoning is clothed in a language so pure and a style so harmonious; he coins such felicitous phrases and such telling formulas; he introduces into his discourse so many striking observations and so many flashes of wit; his irony is so keen and polished; he speaks with such conviction, such ease, and such art, that each of his addresses is a delight to his auditors, whether supporters or opponents.

A half-dozen of his speeches as prime minister have been posted in all the communes of France, and

honor which the Chamber and the Senate confer only on rare occasions. One of his most admired addresses was that in which he defended before the Senate the terms of the law of amnesty, and in which he branded with ignominy the crimes and the wrongs committed in the course of the Dreyfus affair and its sequels. He said :

To those who consider this measure too indulgent, and who believe that we are incurring the danger of enfeebling the sense of responsibility in the national consciousness, I confine myself to replying that there are punishments more severe than those which the law inflicts; that the justice whose seat is in our court rooms is not the sole justice which pronounces sentence upon the guilty. There is another justice, constituted by the public conscience. The decision of this justice will be handed down through the ages, will furnish an example to nations, and has already become a part of history.

When the appropriations for the expedition to China were under discussion in the Chamber, and when certain Deputies, from a sentiment of hostility to the Church, opposed the granting of indemnities to the missionaries, Waldeck-Rousseau came to the rescue with a speech, on the mission and the duties of France in the Orient, of such lofty eloquence that his habitual adversaries applauded with enthusiasm. He has always been

happy, especially in the days when he was the spokesman of the moderate party, when he used to brand the flatterers of the mob the demagogues who "intoxicate the masses with the alcohol of false promises." He framed a definition of socialism which has remained famous, when he termed it, "that enormous and childish illusion, which arouses the evil passions of the credulous, and which traverses paths of hatred and rage to reach its goal in misery and servitude." His social and economic doctrine is summed up in this famous phrase of his, "Labor must own and capital must work."

Gambetta was once declared, by one of his opponents, to speak with such eloquence that his adversaries, the Radicals, had to hold on to their benches to keep themselves from applauding him. The correct, lucid, and somewhat frigid eloquence of M. Waldeck-Rousseau has not quite this marvelous effect. But it is almost as marvelous that during so long a time, despite all the snares of an unrelenting opposition, he should have been able, by almost daily triumphs of persuasion, to hold together and keep in order the majority, by whose aid he has succeeded in giving France three years of a government at once peaceful, energetic, and fruitful.

## II.—M. COMBES, PHYSICIAN, SCHOLAR, AND RADICAL LEADER.

"There are men who can be succeeded but not replaced." The new premier of France would doubtless be the first to apply this time-honored maxim, frequently illustrated in politics, to the statesman whom he so unexpectedly succeeds.

M. Combes is far from being unknown in France, where, for the last fifteen years, he has taken an active part in politics, now in the Senate and now in the cabinet. For all that, his selection as president of the council of ministers has caused considerable surprise. Many have thought that he was not quite equal to the duties of this position, and that his personality was a little deficient in the prestige which M. Waldeck-Rousseau possesses to so high a degree, not to speak of the eloquence which is still more important in a prime minister.

It is true that M. Combes, who, although by no means young, is still comparatively a newcomer in French politics, has not yet had an opportunity of playing a very distinguished rôle. But those who are familiar with the present parliamentary situation in France, and who, moreover, have followed the course of M. Combes since the beginning of his political career, have no difficulty in understanding the reasons which have caused M. Loubet to intrust the leader of

the Radical party in the Senate with the formation of the new cabinet. These reasons are valid and of various nature.

The principal reason is that the Radical party has been the one most successful in the last elections. The great majority of the three hundred and thirty-nine newly elected deputies favorable to the Waldeck-Rousseau ministry is made up of Radicals. It was to the support of the Radicals that M. Waldeck-Rousseau owed his long continuance in power, and it is therefore only just that his policies should be continued by those who had approved and supported them.

Now in the Radical party there are not many men whose past services or personal prestige marks them out as available for the prime ministry. The Radical party has plenty of men of talent, but it has not many men of the very first order. In fact, it has only two. One of these is M. Bourgeois, who is by far the most brilliant and most distinguished leader of the party. But M. Bourgeois, who has been for a certain time forced by family reasons to withdraw from active politics, was unwilling and unable to accept the position for which his name naturally suggested itself. The other is M. Brisson, an upright and austere Jacobin, somewhat lacking in adaptability, whose influence

has of late been on the wane. M. Brisson was approached, but wisely declined.

M. Loubet, well acquainted with the Senate, in which he had sat for twenty years, then sought among its members for a man sufficiently in harmony with the advanced Republican majority to enjoy its confidence, and with sufficient authority in the Parliament to be able to guide it. He selected M. Combes. In the present condition of affairs he could hardly have made a better choice.

M. Combes will be sixty-seven years old in September. He is a small man, which is not counted as a disqualification in France, where a popular proverb and the experience of history agree in inspiring confidence in men of moderate stature. Bonaparte was short; so was M. Thiers. As to his age, M. Combes does not show it. He is full of life and youth, and in that Senate made up of veterans he seems, in spite of his gray mustache and imperial, a new recruit, such vivacity resides in his features and such indefatigable energy in all his figure. Although not a powerful orator, he is a precise and clear speaker, trained in parliamentary debate.

M. Combes comes from the south of France. He is a son of that turbulent and fluent Midi, where men are born eloquent, and where the heat of the sun seems to impart to their natures a double share of liveliness, aggressiveness, and color. Like many representatives of free thought and antagonists of the Church, he began his career under those influences of which he was later to become the irreconcilable adversary. He was educated in a religious seminary, where he was trained in the principles which he has since detested. It has often happened that the enemies of the Church have been of her own household. Voltaire, who uttered the famous phrase, "*Écrasez l'infâme*," was a pupil of the Jesuits. Renan, whose name in clerical circles is as much loathed as that of Voltaire, received all his instruction from priests. The leader of anti-clericalism under the third Republic, Gambetta, who said, "Clericalism, there is the enemy," was, like M. Combes, the pupil of a little seminary. But M. Combes received religious instruction longer than any of them. Voltaire and Gambetta were under clerical guardianship only in their early youth. Renan himself parted with the Church at the age of twenty-two. M. Combes remained within the Church even in his maturity; he took priestly orders, and became what Renan had once dreamed of becoming,—an ecclesiastical professor in a Catholic seminary.

In 1895, when M. Combes was first made minister of public instruction in the Radical cabinet of M. Bourgeois, it occurred to me to hunt

up in the Library of the Sorbonne, in Paris, the theses which M. Combes had written in his old days to obtain his degree of *docteur-ès-lettres*. I found a great volume of several hundred pages,—like all French theses,—upon "The Psychology of St. Thomas Aquinas," and another thesis in Latin, likewise upon a question of scholastic metaphysics. I took the occasion to make these two metaphysical works known, by analyzing them in a Paris newspaper. Then began a campaign of ridicule and epigram in the Conservative press against the Radical who had begun life as a theologian. M. Waldeck-Rousseau himself, who was at that time the champion of the moderate party against the Radical ministry of M. Bourgeois, said, at Bordeaux, in 1897, in replying to those who accused the Republican party of reactionary tendencies: "It is certainly not in our ranks that you must look to find a magistrate\* who has learned how to distinguish real republicans by prosecuting them under the empire, or a learned theologian who has trained himself by the study of the fathers of the Church to spy out better the clericals in disguise." Again, the other day, when M. Combes first appeared before the Chamber, the old clerical and royalist Baudry d'Asson bitterly reproached him for his "apostasy." How did M. Combes come to forsake what he had previously followed, and to break with the political and religious system to which he had previously adhered? This he has never explained to the public. We only know that one fine day he abandoned scholastic theology for the study of medicine; left the department of the Tarn, where he had been known as l'abbé Combes, to establish himself in the Department of the Charente Inférieure, where he was thereafter to pass as Dr. Combes. Modest in his ambitions, he selected a little town of five thousand inhabitants, the town of Pons, where he practiced his new profession. With the zeal of a neophyte, he began to promulgate the new ideas to which he had just given his adhesion, and which, in these southwestern regions, find a soil at once favorable and hostile, inasmuch as one part of the population is of Huguenot stock, and the other, more numerous still, retains a strong Bonapartist feeling.

The physician has a great influence upon the rural population in France. By his daily contact with the people he is enabled to gain the confidence of the simple-minded, and to spread his ideas. M. Combes, nevertheless, made but slow progress. In 1875, he was elected mayor of Pons; in 1879, he was made member of the "Conseil Général," and it was not until January,

\* M. Guyot-Dessaigne, now a Radical deputy, former judge of the empire.

1886, that he succeeded in being elected to the Senate.

The Senate, which has only three hundred members, all at least forty years of age, is less turbulent, less sensational, and less frequented by the public than the Chamber of Deputies. It is for this reason that men of great ability and genuine talent may here long remain unknown to all except those who actually watch them at their work. It was thus that M. Combes was little known when, in 1895, M. Bourgeois placed him in his Radical ministry, by the side of M. Berthelot and M. Cavaignac. He had not attracted the attention of his colleagues, except by his work upon committees, especially those relating to educational matters.

In the Ministry of Public Instruction he was the author of certain bills which testified to the energy of his passion for reform, and to his vigorous hostility to clerical influence. Upon his return to the ranks he continued to make a specialty of those educational questions which, in France, have always engaged the attention of men zealous for the emancipation of the nation. In the discussions which ended, on May 29 of this year, in a complete reform of French secondary instruction, adapted from henceforth on to the needs of a modern democracy, M. Combes played a leading part as spokesman of the Committee of the Senate.

To the measures which, during the Waldeck-Rousseau ministry, had had for their object the disarmament of the clerical party, M. Combes has given ardent support. He was chairman of the Committee on the Law of Associations, whose report was presented by M. Vallé, the new Minister of Justice. When M. Waldeck-Rousseau, in advocacy of the bill, delivered before the Senate one of those great addresses for which he is noted, it was M. Combes who proposed to the Senate that it be posted on the walls of all the villages of France.

Within the last few years the importance and the influence of M. Combes have increased through the progress of the Radical party in the Senate. The group of which he was the chief, before his election as Vice-President of the Senate, has become one of the most important in that assembly, in which, a few years ago, it numbered scarcely ten members.

It is a strange circumstance that the Senate, which, only a few years ago, was regarded by the Radical party as an obstacle to all reform, as an injurious institution which ought to be destroyed,—the Senate, whose abolition was demanded in all Radical platforms,—now supplies the leader of the Radical party. At the present moment the Senate is *par excellence* the conserv-

ative factor in the Republic, less subject than the Chamber, which is directly created by popular vote, to the sudden gusts and the superficial agitations which disturb the masses; it is not affected by those outbursts of clerical or reactionary sentiment which, under the name of Boulangism, anti-Semitism, or nationalism, have too often shown their effects in the Chamber of Deputies. It is precisely upon the field of conflict against clericalism and nationalism,—in other words, as M. Combes expressed it last January in the Senate, “the conflict for the triumph of the spirit of the Revolution over that of the Counter-Revolution,”—that M. Combes has given energetic support to the Waldeck-Rousseau cabinet. He has accepted power with a view to continuing this policy. Like his predecessor, he does not seek to carry out the entire programme of radicalism. He will limit himself to applying vigorously the law of associations already in force and to striking a new blow at clerical education by securing the repeal of the law of Falloux, of 1850, which confers upon ecclesiastical institutions privileges which are not enjoyed by the national schools. Like most men who have freed themselves from clerical influence, M. Combes, as a matter of fact, does not pride himself on being liberal. To an editor of *Le Figaro*, M. Jules Huret, he said recently that he did not believe that the freedom of teaching is a natural right.

Among reforms of a social and political nature, he will revive the project of pensions for working men prepared by M. Millerand, he will reform the system of courts-martial, will reduce military service to two years, and will frame a system of taxation involving the income tax, so long advocated by the Radicals.

To realize this programme,—to which, on June 12, the Chamber gave in advance its approval by a vote of 329 to 124,—M. Combes has assembled in his cabinet a group of colleagues each of whom has been tried and tested, and of whom two at least are of extremely interesting personality. One of these is the new Minister of the Navy, Camille Pelletans, well known in journalism, a somewhat erratic writer and a brilliant orator, who, for twenty years, has displayed as a member of the Opposition qualities which for the first time will be exercised constructively. The other is Maurice Rouvier, who has already been many times minister, and once even prime minister. M. Rouvier has taken part in parliamentary life since the foundation of the Republic, and has been prominent in the most difficult and most troubled periods. A financier of great ability, an orator of remarkable power, he stands out conspicuously above the rest of the cabinet.

## LEADING ARTICLES OF THE MONTH.

### STRIKES IN THE UNITED STATES.

PRIOR to 1881, no attempt was made by the national government to collect data relative to labor controversies. It was only in the period of twenty years closing with December, 1900, that the strike assumed great importance, although this method of seeking redress of real or supposed grievances had been resorted to since 1740, or 1741, when the journeymen bakers of New York City demanded an increase of wages, and made an agreement not to bake bread until their demand was acceded to. The main facts relating to the strikes and lockouts for the period from 1881 to 1900, inclusive, are shown in the accompanying tables, constructed from the sixteenth annual report of the United States Commissioner of Labor. In the *North American Review* for June, Commissioner Wright makes the following comments on the statistics therein presented:

"From the following table relative to strikes,—an analysis of the lockout table need not be attempted, as the lockouts constitute but a comparatively small proportion of industrial disturbances,—it will be seen that the largest number of establishments involved in any one year was in 1899, being 11,317, and the next largest number was in 1886, being 10,053. The losses to employers and employees under all the conflicts,

both strikes and lockouts, occurring in the period amounted to the enormous sum of \$468,968,581, more than 6,000,000 persons having been thrown out of employment for an average of 23.8 days. It is often supposed that most strikes fail; but the foregoing record shows that 50.77 per cent. of the strikes succeeded, that 13.04 per cent. succeeded partly, and that 36.19 per cent. failed.

"The figures in the tables do not represent the actual number of different individual employees who were involved in strikes or lockouts in a given year, because, in many cases, there have been two or more strikes or lockouts in one concern in the same year.

"Of the whole number of strikes, 14,457 were ordered by labor organizations; these represented 103,455 establishments out of a total of 117,509. Of the strikes ordered by organizations, 52.86 per cent. were successful, 13.60 per cent. partly successful, and 33.54 per cent. unsuccessful. These percentages coincide very closely with those relating to the total number of successful, partly successful, and unsuccessful strikes.

### GEOGRAPHICAL DISTRIBUTION.

"The distribution of strikes offers occasion for some very serious reflections. During the twenty years included in the report, New York shows the largest number of strikes, as well as the larg-

est number of establishments affected, that State having 28.34 per cent. of the total number of strikes in the country during the whole period, and 32.20 per cent. of the total number of establishments involved. Pennsylvania follows, with 12.48 per cent. of the total number of strikes, and 15.69 per cent. of the total number of establishments involved. Illinois had 11.58 per cent. of the strikes, and 17.68 per cent. of the establishments affected.

"In a group of States consisting of Illinois, Massachusetts, New York, Ohio, and Pennsylvania there were 87,878 establishments under strike during the period out of a total of 117,509 in the whole country; that is, in this group of States the establishments involved were 74.78 per cent. of all involved. These States contained 45.02 per cent. of all the manufacturing establishments, and employed 55.15 per cent. of the capital invested in the mechanical industries of the United States.

## INDUSTRIES CHIEFLY INVOLVED.

"As regards the employees involved in strikes, almost the same percentages are shown; but the industries most affected by strikes during the twenty years were the building trades, with 4,440 strikes, involving 41,910 establishments and 665,946 employees; coal and coke, with 2,515 strikes, involving 14,575 establishments and 1,892,435 employees; metals and metallic goods, with 2,080 strikes, involving 4,652 establishments and 511,336 employees; clothing, with 1,638 strikes, involving 19,695 establishments and 563,772 employees; tobacco, with 1,509 strikes, involving

6,153 establishments and 251,096 employees; and transportation, with 1,265 strikes, involving 3,436 establishments and 484,454 employees. It is thus seen that of the 22,795 strikes which occurred during the period, 59 per cent. were in the six industries just mentioned, while of the 117,509 establishments involved, 76.95 per cent. were so engaged. As regards the employees thrown out of employment by strikes, 71.60 per cent. of the total number were connected with establishments engaged in these six industries."

As to the success attending strikes, Colonel Wright shows that strikes to secure an increase of wages included 28.70 per cent. of all establishments involved, and of this number success resulted in 52.77 per cent. In strikes undertaken for both increase of wages and reduction of hours, 62.49 per cent. succeeded.

## "PROSPERITY" AND THE WAGE-EARNER.

THE publication of some of the data comprised in the census of 1900,—especially the information contained in Bulletin No. 150, devoted to manufacturing,—affords an opportunity to review the progress made during the decade from 1890 to 1900. If the returns do not fully bear out the expectations, based on the last few years of prosperity, we should remember that in the middle of the decade under consideration there was a four years' period of depression (1893-96), and this went far to neutralize the progress shown in the remaining years. This point is emphasized in an article, entitled "Warning from the Census," in *Gunton's Magazine* for June. In this

article the editor shows that, while the total value of manufactured products increased during the last census decade 39.1 per cent., the population increased in the same period 20.7 per cent.

#### NO INCREASE IN AVERAGE WAGES.

"The test as to whether or no, or how much, this increased product really registers any perceptible increase in the national welfare, is whether it yielded a larger actual distribution among the common people. And the key to this must be found in the comparative amount of wages, and purchasing power of those wages, as expressed in the price of commodities. The total amount of wages paid in 1890 was \$1,891,228,321, and in 1900 it was \$2,330,273,021, showing an increase of \$439,044,700, or 23.2 per cent. The number of laborers among whom this was divided was, in 1890, 4,251,613, and in 1900, 5,321,087, showing an increase of 1,069,474, or 25.2 per cent. Thus, while the increase in the amount paid in wages was large, the increase in the number of laborers is relatively larger. The total wages increased 23.2 per cent., while the number of laborers increased 25.2 per cent., showing that the rate of increase of laborers was about  $8\frac{1}{2}$  per cent. greater than that of the wages. This is painfully emphasized by the fact that the average wages in 1890 were \$444.83, and in 1900 only \$437.95, or actually \$6.88, or 1.5 per cent., less in 1900 than in 1890. It should be said, however, that the \$444.83 for 1890 was probably too high an average, due to a different method of estimating the average number of laborers from that employed either in 1880 or 1900, and due also to the fact that in 1890 certain relatively high-salaried employees, such as salesmen, clerks, etc., were included in the wage-earning group, thus raising the general average of wages, while in 1900 these employees and their salaries were shown separately. This might account for the seeming decrease in average wages, but would still leave the figures showing practically no increase.

#### ACTUAL DECLINE IN "REAL WAGES."

"If we turn to the prices, we find, according to Dun's index number of prices of 350 articles averaged according to importance in consumption, that on January 1, 1890, a given amount of these products cost \$90.191; and on June 1, 1900, when the census was taken, these same articles cost \$91.829, showing an increase of \$1.638, or 1.8 per cent. Here, then, if we take the wage averages for the two periods just as they stand, we have an actual fall of 1.5 per cent. in wages and a rise of 1.8 per cent. in prices, which means a reduction of 3.3 per cent.

in real wages, or the purchasing power of a day's work. Even assuming that there was no real fall in average wages, the decreased purchasing power of a dollar would indicate a decline of nearly 2 per cent. in real wages during the decade."

#### THE LAST CENSUS DECADE COMPARED WITH THE PRECEDING ONE.

Comparing the results of the last census decade with the preceding one, Professor Gunton finds that, from whatever point the facts are viewed, the actual progress was greater between 1880 and 1890 than between 1890 and 1900.

"The products per capita increased just twice as fast. Nominal wages increased 28 per cent., and real wages 38 per cent. in the former period, as against practically stationary wages between 1890 and 1900, and a fall in real wages of nearly 2 per cent. The actual increase in total product was \$335,281,737 greater from 1880 to 1890 than from 1890 to 1900, while the per cent. of increase was 74.5 per cent. in the former period, as against 39.1 per cent. in the latter, or nearly twice as great. Thus it will be seen that in some respects, conspicuously wage distribution, we have made no progress at all during the decade ending 1900, while in every respect,—including investment of capital, total product per capita, and purchasing power of money,—the progress of the previous decade was strikingly greater than in the last."

#### THE SHIPPING COMBINE.

MANY of the English periodicals indulge in more or less excited comment on what some of them are pleased to term the "Morganeering" of the ocean carrying trade,—that is to say, the purchase of the White Star and other Atlantic lines by the combination headed by Mr. J. Pierpont Morgan. Mr. W. T. Stead, writing in the *London Review of Reviews*, is inclined to ridicule the hysterical outbursts of the British press, and to contribute what he can to the soothing of John Bull's troubled spirit. He says:

"To read the excited comments of some newspapers, it would seem as if the purchase of these steamers were equivalent to the disappearance of the British flag from the seas. Questions have been asked in Parliament, ministers have been adjured to take energetic measures against the Morganeering of our mercantile marine; and, in short, John Bull has uttered the same kind of incoherent ejaculations which we all indulge in when we are rudely roused from a sound sleep by an unexpected summons. There are, however, signs that the mood of indignant and irra-

tional surprise is passing, and that the British public is beginning to realize somewhat of the absurdity of its momentary panic. For my part, I am utterly unable to perceive why the purchase of second-hand ships by American capitalists should be regarded as a deadly blow to British enterprise, when the very men who are making the hubbub would compass heaven and earth to secure for British shipyards American orders for building a brand new fleet.

MORGANEERING.

Trustacean attacking a ship. (Facsimile from the work of Olans Morganus Magnus: *De Gintibus Steamship olinabus*, 1902.)—From the *Westminster Gazette* (London).

“Suppose that Mr. Pierpont Morgan, with ten millions sterling in his pocket, had announced that he was going to place orders for the building of first-class liners. We all know what would happen. German and British shipbuilders would compete eagerly for the privilege of executing his orders; and if he decided to place his orders with the British builders, a pæan of praise and exultation would have gone up from all our newspapers. They would have declared that the placing of such gigantic orders with British shipbuilders was the most magnificent tribute to the preëminence of British industry. They would have crowed and strutted in all their newspapers over this conclusive tribute to our preëminence in this department, and every one would have felt that we could breathe freely once more, as we were still at the top of the walk. But because Mr. Pierpont Morgan preferred to buy second-hand ships instead of ordering new ones, we quake in a panic. Why this should be is a mystery. The absurdity is so great that in another month we shall probably find that the panic is past, and it will not be surprising if by the end of the year we discover that Mr. Morgan has been one of our best friends.

“The *Times* Vienna correspondent has pointed

out that the Germans, with their usual astuteness, have been prompt to seize this momentary fit of unreason on the part of the British public in order to excite ill-feeling between the English-speaking nations, and many foolish persons in this country have done their best to aid the Germans in the mischievous effort. As a matter of fact, we have everything to gain and nothing to lose from the Morganization of the Atlantic ferry. As the Americans supply much the most of the freight and by far the most of the passengers, it is reasonable and natural that they should wish to own the ships. If, instead of persisting in their protective policy, they had allowed free registration of foreign-built ships under the American flag, they would long since have had Atlantic liners of their own; and as we have been perpetually objugating them because of their persistence in this protective policy, it is extremely foolish to shriek with fear when, by a side wind, they have succeeded in acquiring control of Atlantic liners without placing them on the American registry under the American flag.

“The movement toward the Americanization of the Atlantic ferry compels even the most sluggish amongst us to recognize the fact that the process of Americanization is going on

THE MODERN GULLIVER.

UNCLE SAM: “Good-morning, John. I’ll call for your tight little island to-morrow!”

From the *Bon Accord* (Aberdeen).

steadily, and that nothing that we can do will prevent it. The wealth, the enterprise, the energy of the Americans, are forces against which it is in vain for us to contend. We shall, indeed, be much better advised if, instead of regarding them as hostile forces, we make the best of the situation, and enter into the closest possible partnership with the young and rising power beyond the Atlantic. The Americanization of Great Britain will follow in due time; the re-

union of the English-speaking race will be brought about on business principles; and some time in the future Mr. Pierpont Morgan, or his successor, will have to negotiate a much greater combine than any which has yet startled the world. As the White Star shareholders and Messrs. Ogden and others have found it to their interest to be merged in the American combine, so the British Empire will discover that its solid interests point not to a hopeless effort to rival the United States, but to entering the combine."

#### Profits and Loss of the Deal.

The *Monthly Review*, in an article on "Profit and Loss on the Atlantic Deal," takes rather a serious view of the effect of the Americanization of the Atlantic shipping. At the same time it points out that the fundamental facts which govern the situation were such as to render such a change inevitable sooner or later. Four-fifths of the freight, three-quarters of the first-class passenger fares, and more than one-half of the emigrant money which British shipowners have been earning has come out of American pockets, and the whole of this gigantic business was the product of American soil. It was gathered and transported cheaply to the coast by American enterprise, and yet for years Great Britain has been enjoying the whole of what was thus comfortably put into her pockets. It was inevitable that the moment would come when America would demand her share. The British shipowners had no option but to accept the terms which were offered, and so it is that the White Star and her sister enterprises have passed out of English control. They remain under the British flag, but only because under American navigation laws they cannot get an American register.

#### THE ADVANTAGES OF THE DEAL.

At the same time the *Monthly Review* points out that against this drawback England gains enormously by surrendering the Atlantic food supply to America. By the sacrifice of what is really a very small portion of her maritime commerce, she places her most vulnerable point under American protection. It is true that she is losing a small part of her offensive force, but by parting with it she is committing America to something like a defensive alliance. Is it, after all, a partnership that America is beginning to form, a partnership from which she will be unable or unwilling to escape? At the end of the eighteenth century, when America was still bitterly hostile to England and still warmly attached to France, war broke out between England and France. America continued to supply England with corn. A diplomatic quarrel en-

sued between America and France which reached so high a pitch that America was prevented from openly joining England in the war by France withdrawing her claims. To protect her great trade she was ready to fight her best friend by the side of her worst enemy. That trade was vital to her then, and under the new conditions it will be more than ever an essential part of her existence.

#### REENACT THE NAVIGATION LAWS!

But while the economic conditions determine that the true equilibrium can only be obtained when the bulk of the trade is in American hands, over nearly all the rest of the world the same conditions determine that the equilibrium should be found in British predominance. If there is any intention on the part of the Americans to spread the dominion of the great syndicate over wider seas, it is necessary to England's commercial position that she should take action on the first sign of such an intention. A simple reenactment of the old navigation laws, which prohibited the vessels of foreign countries carrying into British ports anything but their own national products, must infallibly choke out foreign competition. Without the trade between British ports, no shipping enterprise could thrive anywhere but in the North Atlantic or North Pacific; and even there, by means of Canada, England holds the interior lines. By an imperial navigation law she would have at her call a force which she could mobilize by a stroke of the pen. In return for the monopoly which the state insured to the shipowners, the shipowners would have to take the state into partnership on the lines on which the guaranteed railways of India are in partnership with the Indian Government. The great lines would be subsidized, and in return for this would have to fulfill certain naval, military, and postal duties, and to submit to the control of a government director. Probably a mere preferential treatment of British ships in the matter of port duties would bring England's pushing rivals to reason. The question is one which the editor thinks could profitably be discussed at the approaching assembly of colonial statesmen.

#### The Alarmist View of the Question.

"Calchas" contributes to the *Fortnightly Review* an article entitled "The Ocean Trust and National Policy," which takes a gloomy view of the situation. He maintains that England's loss of one-fifteenth of her steam tonnage, and that the best of it, is a serious matter, so serious that it threatens her maritime predominance and the maintenance of the empire. He does not think that the combination was inevitable. He thinks

that it could have been resisted, and ought to have been resisted. The real origin of the whole strategical scheme was the steel trust, and the shipping lines and the ocean syndicate are only the tentacles of that great octopus. "Calchas" quotes Mr. Schwab's statement to an interviewer from the *Koelnische Zeitung* to prove that the steel trust intends to cut off the entire export of British and German iron industries in the lean years, when England will realize what American competition means as she has never done before. The syndicate is not meant to be confined to the North Atlantic. The steel trust looks to the Australian and South African markets. The acquisition of the White Star Line provides Mr. Morgan with an Australian and South African service. What we are discussing is not the insertion of the thin end of the wedge, but a blow driving up to the middle a wedge already inserted. If the nation remains passive, in ten years' time the finest passenger steamers and the largest freight fleets in the Atlantic will fly the American flag. The Belfast building agreement is simply meant to make as difficult as possible any effort on the part of English capitalists to fight the trusts. They must, however, be fought, and the hope of "Calchas" is that the syndicate may break down from over-capitalization. The German lines, with a tonnage of over a million, have only a capital of £14,000,000 (\$70,000,000), while Mr. Morgan capitalizes his syndicate at £34,000,000 for a tonnage of only 648,000 tons. To some it appears as if Mr. Morgan had bought, at a price infinitely beyond its value, a mass of tonnage which in ten years will be obsolete. But "Calchas" is not disposed to rely upon these

councils of optimism. He thinks that Mr. Morgan is only at the beginning of his conquests.

#### HOW TO FIGHT THE TRUSTS.

His advice is that England should fight the trusts, and that the British state should take the field against the American trust. The German Emperor has shown what may be done by way of prevention. "Calchas" suggests that something may well be done by way of cure. First, he would amend the law of merchant shipping so as to secure complete equality of competitive conditions between British and foreign vessels. The anomaly of the lighting dues should be abolished, and foreign vessels be compelled to submit to the same load-line regulations as those enforced on British vessels. Secondly, he would deepen British docks and harbors. Thirdly, he would grant subsidies to British shipowners, and begin by counterpoising the grant of £280,000 per annum, which has enabled German shipping to gain the ascendancy in the far East. Fourthly, he would give an imperial guarantee to a new imperial steamship line running from Queens-town to Halifax in less than five days. As the nucleus of a counter-combine the Cunard and Allan lines are indispensable. If nothing but subsidies will keep them out of Mr. Morgan's hands, England must subsidize at once. Fifthly, he would reenact the navigation laws in a modified form as the only remedy which would be absolutely and instantly effective. If England levied discriminating duties upon all imports brought in foreign bottoms, an attempt of the United States to retaliate would be commercial suicide.

"Calchas" reminds us that Adam Smith regarded the navigation laws as perhaps the wisest of all the commercial regulations of England. Their revival would smash the whole theory and process of Morganeering at a single blow. The navigation laws would make British ships what they would be in universal free-trade conditions, the cheapest medium of exchange. There is no greater political ideal in the world than that of Anglo-American friendship, but England will promote it far better by healthy proof of her own vigor and resources than by a spirit of maudlin resignation.

In the *New Liberal Review* the writer of the serial articles on "The Present State of our Navy" deals with the shipping trust. His argument is that England must fight the trust by founding a line of steamers which will be free from the influence of the American railways. Halifax should be the port on the American side of the Atlantic. It is 840 miles nearer to Liverpool than is New York, and in time of steaming

BETTER KILLED THAN SCOTCHED.

J. B. (to Lord C. B.): "I don't like the look of that serpent, Charlie; you might have a shot at him as well."  
From *Moonshine* (London).

this would save a day and a half. A 25-knot steamer would cover the distance in four days, and the great central city of the United States, Minneapolis, could be reached at the end of six days. Such a line of steamers would have a good influence on Canada. Six steamers would be required, costing about six millions sterling. The writer proposes that the admiralty should pay a subsidy of £70,000 a year to each steamer. Canada has already offered a subsidy of £100,000 for such a line.

#### THE REAL MEANING OF THE CRUELTY IN THE PHILIPPINES.

THERE is a striking article in the July *McClure's* by Dr. Henry C. Rowland, a young army surgeon who was detailed for duty in the Philippines, and who had unusual opportunities for studying the physical and mental conditions of the American soldier in those islands. Dr. Rowland's duties included attendance on great numbers of sick and wounded soldiers returning to America, and extensive field and hospital service which brought him into the most intimate personal contact with men representing all the different types of the American soldier. He returned to the United States the second time on the transport *Sumner*, in charge of the insane patients sent aboard by the different shore hospitals, a majority of the cases being melancholia following chronic nostalgia.

In his exceedingly plausible explanation of the horrors of Philippine warfare recently brought to us, he begins by admitting that the men who were guilty of cruelty must have approved of what they did because the American soldiers are not automata by any means.

"Reading in his morning paper of the torture and wholesale extermination of helpless Filipinos, the average New Yorker or Philadelphian thinks at once of the Tom, Dick, or Harry whom he happens to know in the Philippines, and is reassured that if only all of the men were of the type of this particular acquaintance, there would be no such disgraceful blots on the pages of the nation's recent history." But Dr. Rowland tells us that it is just such a Tom, Dick, or Harry who has done the horrible things, and he proceeds to show how it is possible.

#### WHAT NOSTALGIA CAN DO.

"When the regimental surgeon writes 'nostalgia' as the diagnosis of the patient, he has to hesitate for a moment to decide whether the more fit term might not be 'malingering.' At any rate, patients with the former malady do not receive any extra amount of care or atten-

tion. Yet this chronic homesickness is one of the most dangerous disorders which we have to treat. It represents the solution from which might crystallize insanity. It is more dangerous in that it is so often unsuspected, and will smoulder along until it finally bursts in a flame of suicidal or homicidal mania. It accounts for more dementia than sun or fever. When a man is herded with a body of other men for a while, he begins, to a certain extent, to lose his individuality. When there is not one single familiar feature in all of his environment, this loss of a former identity is much enhanced. He begins to cease to think of himself as Jones, or Brown, or some one else, of such and such a place. He is simply a unit of a certain whole, and the discharge of his duties in this capacity grows more and more automatic. He is no longer influenced by the conditions under which he was born and bred. He ceases to be governed by his former code of ethics. There is nothing around him to remind him that he is himself. His principles unconsciously adjust themselves to surrounding conditions and circumstances.

#### MANY CASES OF SUDDEN DEMENTIA.

"One day, while on guard duty, a second sergeant of one of the companies was suddenly seized with an acute dementia. The worst feature of his case lay in the fact that at the time his belt was full of ammunition and his Krag-Jørgenson was in his hands. He had strayed a few yards from the outposts, when, suddenly, and without the slightest warning, he threw up his piece and opened a hot, though deliberate, fire upon his comrades. The others, recognizing the situation, promptly took to cover. The cover was full of Filipinos, but that was an unimportant item: the Filipinos were poor shots, the sergeant known to be a fine one. Seeing no one in sight, the madman started for the enemy's trenches at a slow run, and as he ran he howled. The last that was seen of him was as he disappeared in an intervening clump of bamboos. Two days later he returned unharmed, with but five rounds left in his belt. The dementia had passed, leaving him confused and a trifle depressed. Why he was not killed was never definitely learned. His comrades told the surgeon that for several weeks he had been moody and uncommunicative. Once or twice he had remarked that unless they went on a 'hike' before long he would lose his mind. His diagnosis was entered in the hospital records as 'acute mania,' and, there being no return of the disorder, he was in due time recorded as 'recovered.'

"A few days later a corporal suddenly leaped

from the window of a nipa hut where he was quartered, and, without the slightest discoverable cause, sprang upon a passing native, threw him to the ground, and began to beat him unmercifully. It took ten men to take the soldier to the hospital, where for two hours he raved, suffering apparently from the delusion that he was in action. The surgeon did not give him any sedative, wishing to observe the case. This man had formerly belonged to the signal corps, and in his delirium he sent and received messages, and went through all the technicalities of an advance under fire. Before long he became quiet, and slept all night. The following morning he had no recollection of the incident, but was very depressed, rather ashamed of his being in hospital, and requested to be returned to duty, as he 'felt all right.' This man bore an excellent reputation, was popular with his officers and comrades, and had never been known to drink or in any way badly comport himself.

"There were two other men in the company who were known to be suffering from chronic nostalgia. The resulting depression of spirits had made them negligent of their duties to the extent of being several times reprimanded, and once or twice sent to the guard-house. Soon there developed the profound conviction that every one was leagued against them. This in one case produced a morbid mental condition that resulted in an attempted suicide by jumping into the river. The other was found by an officer and a squad of men deliberately attempting the murder of a native. It was impossible to discover any motive for the act. One of these men returned to San Francisco under the care of the author, the other was lost sight of. The man who was sent home made a perfect recovery before the Golden Gate was reached.

"There was another case of a commissioned officer whose health was such that he was ordered by the commanding medical officer to remain in hospital. This order produced a state of irritation in the patient entirely disproportionate to the cause. Upon his attempting to leave the officers' ward he was forcibly detained, at which his rage knew no bounds, even reaching the point of his loudly threatening to kill the medical officer upon the next opportunity that offered. The recovery of this patient was, as far as we know, complete. Indeed, he could hardly have been described as demented at any time."

Dr. Rowland gives such instances to help him in his graphic account of an imaginary trio of nice, average American boys, whom he introduces into the hell of Philippine warfare to do exactly the things which have recently shocked millions of American citizens.

## TWO YEARS' LEGISLATION IN PORTO RICO.

IN the July *Atlantic Monthly*, Mr. W. F. Willoughby, treasurer of Porto Rico, has a timely article describing the work of the first legislative assembly and its enactments, which go into effect July 1, 1902. Congress gave the newly constituted government the greatest freedom to work out the problems of revenue, education, public works, and local government.

The two sessions of the first legislative assembly have been completed. The American members of the government, constituting the majority of the executive council, are able to control the action of that body. The lower house is composed entirely of representatives elected by the Porto Ricans. Therefore, any measure to become a law must meet with the approval of both representatives of the United States and of Porto Rico.

### THE NEW REVENUE LAW.

A new revenue system for the island has been devised after careful investigations by the President's special commissioner, Dr. Hollander. At his recommendation, a fiscal system has been provided closely following the American practice of taxation. Porto Rico's revenues are obtained from excise and license taxes on liquors, tobacco, and certain classes of commercial paper, a property tax of one-quarter of 1 per cent. on all real and personal property, a tax upon inheritances, and certain miscellaneous imposts. Congress has provided that the receipts from all customs duties from Porto Rico on foreign importations should be turned over to the island treasury, and the act itself made elaborate provisions for carrying out a thorough assessment of property on the island.

### A GOOD SYSTEM OF PUBLIC SCHOOLS.

Mr. Willoughby thinks the bill embodying the fundamental school law for the island is very successful. Local boards have been created all over the island, the municipalities have been required to devote a certain percentage of their income to school purposes, schools have been established, and the Porto Ricans have entered into the work with great enthusiasm. Special acts provide for the sending of twenty young men and women to the United States, at the expense of the insular government, to be educated in the various arts and trades, and a further number of young men to pursue advanced studies.

### TRIAL BY JURY ESTABLISHED.

Governor Hunt, of Porto Rico, when secretary, introduced a law providing for trial by jury. Another created an insular police force, the municipalities not possessing financial resources

sufficient to maintain a police force on a proper basis. Police courts have been organized, a director of charities and a director of prisons have been appointed, a penitentiary has been established, cemeteries provided for, and the larger municipalities have been authorized to incur bonded indebtedness to an extent not exceeding in any one case 7 per cent. of their total property value.

#### AN ENTIRE NEW SYSTEM OF LAW CODES.

All these important matters were attended to in the first session of the legislature, and the second one definitely adopted a series of law courts, and reorganized the entire system of local government. The special commission appointed by the Secretary of War drafted a penal code, a code of criminal procedure, a civil, and a political code. The adoption of these codes will produce a great improvement, as the change of government from the Spanish to the United States military authorities, and then from the military to the civil authorities, has produced great confusion.

#### A NEW SYSTEM OF LOCAL GOVERNMENT.

The bill for the new scheme of local government changes the old system whereby legislative and executive powers were exercised by the same parties. Under the new *régime*, the mayor of a municipality is no longer the president of the council, and the council is intrusted with no appointments except that of comptroller.

In the second place, the local authorities do not any longer have to get an authorization before they can take any important step, though, on an appeal, the central government can intervene to prevent illegal action. The treasurer of the island prescribes the manner and form in which the municipality shall keep their accounts. He has power to deposit moneys, audit claims, require reports, and, most important of all, to inspect the accounts of the municipal treasurers and comptrollers.

Two special laws compel each municipality to devote a certain proportion of its income to a school fund, and divide the island into a number of road districts, with a provision that no less than 25 per cent. of the income derived from rural real estate taxes shall be carried to a road improvement fund.

Mr. Willoughby calls attention to the fact that all this work, and more which he tells of, is only the beginning of the task, as these laws will depend entirely for their success on the manner in which they are administered and the tact and ability with which the American representatives exercise their delicate functions of control and supervision.

#### OUR ACCOUNT WITH CUBA.

THAT there is a debit as well as a credit side to our national dealings with Cuba is a fact that Mr. Albert G. Robinson does not intend to have ignored. In an article which he contributes to the *June Forum*, he reviews what has been done during the past four years by the government of intervention, summarizing the gifts and benefits to Cuba,—as well as the burdens and liabilities,—which he regards as directly chargeable to the American administration.

The benefits, it hardly need be said, greatly outweigh the sum total of burdens bequeathed to the Cuban people by our government. There stands, first, to our credit the expulsion of the Spanish oppressor. Then there was the establishment of a school system reaching 150,000 pupils and employing 4,000 teachers. This school system, notwithstanding its cost (about \$8,000,000 to date), is undoubtedly a valuable legacy, although Mr. Robinson thinks there is some reason to fear that the new republic will be unable to maintain it on the same scale. The sum of \$10,000,000 has been spent on sanitation, and although the discovery of the fever-bearing mosquito has removed one of the chief motives for the cleansing of Havana and other Cuban cities, still the general benefits of cleanliness remain, and it is something that the metropolis of the new republic has learned the lesson of municipal sanitation.

#### AN HONEST AND EFFICIENT GOVERNMENT.

Financial honesty in administration is another American innovation in Cuba. On this point Mr. Robinson says:

“With the unfortunate and glaring exception of the frauds in the Post-Office Department, the administration in Cuba is open to no charges of any moment upon the score of its financial honesty. A few cases of peculation have occurred from time to time, but they have been wholly trivial. The change in the methods employed in Cuba's custom houses has been radical and fruitful in its results. For three years, one of the most efficient officers in the American service, Col. Tasker H. Bliss, U.S.A., has administered the affairs of that institution with a fidelity to his arduous duty, and a persistence in clean and honest methods, which have revolutionized the department, and which will stand as an object-lesson in all the days to come. His difficulties have been endless, and his work has been onerous. His successful solution of his complex problem has commanded, for him and for his work, the approval and the respect of the best in Havana's commercial circles. Whether or not the

Cubans will continue his methods when the work comes into their hands, his conduct of that department will remain as a permanent standard of honesty and efficiency.

"What has been said of Colonel Bliss is to be said as well for Major Eugene F. Ladd, who, for some two years, administered the affairs of the insular treasury. During that time there passed through his department upward of \$30,000,000.00, no single penny of which remained unaccounted for. His withdrawal from the island was the occasion of keen and sincere regret on the part of all who had dealings with his department. This was due both to his personality and to the unswerving integrity with which he conducted the affairs of his important office.

"In the main, the departmental work of the government of intervention is deserving of the highest encomiums, and cannot fail of important results in the later conduct of the work by other hands. The work of Major E. St. John Greble, in the inauguration of industrial schools for orphan boys and girls, and in the reestablishment of the system of hospitals and asylums for the sick, the helpless, and the insane, will long remain as a memorial of faithful and endlessly helpful service. There are a score of American officers in Havana, and other Cuban cities, who have done most faithful work in the effort to lay a broad and stable foundation for the future structure. If Cuban administration be not honest, if Cuban officials be not faithful, it will not be for lack of proper example. It will be because three years of financial honesty in official administration are not sufficient to eradicate the teachings of three centuries of systematic dishonesty.

Among the minor bequests incidental to the routine of governmental activities in Cuba, Mr. Robinson mentions the construction of bridges, the reestablishment and improvement of the lighthouse system, repairs to public parks and buildings, broadening of the marriage laws, improvements in the sanitary condition of penal institutions, the establishment of a free dispensary in Havana, and the promulgation of a law prohibiting cruelty to animals.

#### CHANGES IN LEGAL PROCEDURE.

After this enumeration of the undoubted blessings conferred on the Cuban people during the period of the American occupation, Mr. Robinson proceeds to set forth certain phases of American rule which, he thinks, may result in injury rather than benefit. These have chiefly to do with the administration of justice. Mr. Robinson holds that we were not called upon to reform the legal system inherited from Spain. As well might we

have remodelled Morro Castle because, forsooth, we objected to its architecture.

It is true that many of the existing laws in Cuba did not conform to American ideas. The same may be said of the laws which existed in Louisiana at the time of our acquisition of that section. The Louisiana country was ceded to the United States in 1803. In 1804, there was established the Territory of New Orleans, practically identical in its boundaries with those of the State of Louisiana, which was admitted to the Union in 1812. It was very many years before radical changes were introduced into the established code of that section, which was distinctly a part of the United States, although the laws were Spanish and basically the same as those of Cuba. Yet in Cuba, declared by our courts to be foreign territory, and in spite of our declaration against exercising 'sovereignty, jurisdiction, or control,' men having little or no knowledge of Spanish or any other law, and wholly unable even to read the laws of Cuba, have annulled, repealed, and amended at their own sweet will.

"Of practical reform in methods of procedure there has been little enough, and the courts of the island are not greatly different from what they were when we went there three years ago. It would appear that all sight has been lost of the fact that Cuban laws are for Cubans and not for Americans. It may be wholly within the functions of a temporarily established government of intervention to issue regulations which facilitate the necessary work of an administration. This would include such matters as the proper registration of births, the fixing of salaries, the obligation to contract for all public work, the quarantine of immigrants during the fever season, and all the numerous minor instances of frequent occurrence in purely administrative processes. It is difficult, however, to find any justification for many radical changes which have been introduced by methods which, at their best, are greatly confusing."

The burden of Mr. Robinson's complaint is that in dealing with Cuba we ignored, to a great extent, Cuba's past history, and attempted political and administrative reforms when it was the island's economic condition that most needed attention. For this we have done comparatively little.

"Whether that which we have really done for Cuba and the Cuban people shall prove of lasting benefit to them and to ourselves depends chiefly upon their own ability to do for themselves what we have failed to do for them, and toward the accomplishment of which we have contributed little or nothing. Cuba's weal or woe in days to

come will depend upon her industrial prosperity. The determining factor will, undoubtedly, be the investment of foreign capital in the development of her wonderful resources.

"Sooner or later, and probably at no distant day, Cuba is destined to become a part of the United States. The annexation of the island, after she shall have made an essay of such independence as is left her under the terms of the Platt amendment, will be the completion of an American policy of a hundred years' standing."

#### THE CORONATION OF EDWARD VII.

MANY articles apropos of the coronation appear in the leading British periodicals for June.

The *New Liberal Review* opens with a paper by Sir George Arthur on "King Edward the Seventh." He says that never before in English history has the distinguished yet strictly subordinate position of the heir to the throne been so happily filled. It is by no means the least of King Edward's qualifications to reign that through his long period of probation he has been the first to obey. The coronation is above all else a religious act of supreme solemnity; it is a pact made between King and people, with an appeal for the divine sanction. In these days we have attained to a synthesis of the conflicting principles of the claims of the ruler and the rights of the individual. In theory the King can perform every function of government, but in practice most of the work personally performed by the sovereign is wisely hidden from public view. The saying that the King reigns but does not govern, means that on his ministers, not on himself, rests the personal responsibility for all measures and acts of government. Sir George Arthur lays stress on the fact that the King has been brought up to the business of statesmanship. He has always been in office, and his knowledge of political affairs is actually greater than that of any other man in the country. His position is a common ground upon which all can meet, and the fact that the King is a *persona grata* to all the chief men in the realm serves to smooth down the acerbities of political life.

#### A MORIBUND SERVICE.

Mr. L. W. Vernon Harcourt, in the same review, deals with the coronation among "Dimorphous Ceremonies." His article gives an interesting account of the old ceremony of knightage; but his chief object is to point out certain incongruities in all such ceremonies. *Prima facie*, he says, it is not credible that a coronation service used for Ethelred II. can prove suitable for the

coronation of Edward VII. He does not think that the coronation service will be retained much longer. It cannot be regarded as an essential religious ceremony, because it may be deferred with impunity, while as a social function it is indefensible on account of the expense incurred. If it is merely a popular ceremony, it might be made a great deal more popular, at the price, by being held in the Albert Hall or in Hyde Park. From the point of view of a religious service it is altogether regrettable, for, ethically speaking, Westminster Abbey is as openly converted into a house of merchandise, for the purposes of the spectacle, as if oxen and sheep were sold there. Altogether, Mr. Harcourt is hardly a coronation enthusiast; and most persons would think that coronations are too far outside the sphere of logic to be criticised on such purely logical grounds.

#### In Bygone Times.

Mr. E. S. Hope, C.B., contributes to the *Nineteenth Century* a long article on "Bygone Coronation Progresses." He goes through the coronation records from William the Conqueror's time up to George the Fourth, and gives many interesting notes as to incidents that occurred and the evolution of the present ceremonial order. Richard the Second's coronation is the first in which any record of the "Court of Claims" appears, and also is notable for the first appearance of the Knights of the Bath. In those days a Norfolk was Earl-Marshal, a Hastings carried the Golden Spurs, a Dymoke was King's Champion, although he seems not to have known whether his challenge should be made at the Abbey or in Westminster Hall. The great cavalcade from the Tower was abandoned by James the Second on economical grounds. Several sovereigns have been crowned twice, Richard the First having the ceremony repeated after his return from captivity. But only one king, Edward the Fifth, went to his grave unanointed and uncrowned. Edward the First was the first sovereign to be crowned in the Abbey as it now stands; and his son, Edward the Second, was the first to be enthroned on the Stone of Destiny. Only once has this stone left the Abbey, and that was when Cromwell was installed upon it in Westminster Hall as Lord Protector. It is to be hoped that the present coronation will not end as did Charles the Second's, when a fight took place in Westminster Hall between the King's Footmen and the Barons of the Cinque Ports for the possession of the canopy, with its silvered spears and silver-gilt bells; or as did George the Fourth's, when the banquet tables were looted and very nearly cleared of all the coronation plate. George the Fourth's coronation is

also notable for its prodigious cost of nearly £240,000 (\$1,200,000). Mr. Hope says that at the coronation of George the Third seats on the line of the procession from Westminster Hall to the Abbey let for a guinea to five guineas each, as against a few shillings at the coronation of the first two Georges.

#### Alfred to Edward.

The magazines, singularly enough, indulge in very little poetry apropos of the coronation; but *Macmillan's Magazine* publishes a poem by E. H., entitled "King Alfred to King Edward, June 26, 1902." It begins:

"I, Alfred Athulfing, king, o'er this people kept watch and ward  
In the days when the wild sea-wolves swooped thither on foray and raid."

From his unknown grave King Alfred greets King Edward VII., and communicates to him kind messages of sympathy from all those who have served the state in camp or on council board:

"And they who have toiled with the pen, and they who have toiled with the sword,  
And broadened the bounds of Empire by arms, or by arts adorned."

It reminds him that guests unbidden throng chapel and chancel and nave.

"And the aisles of the Abbey, the unseen hosts who silently watch from the grave."

#### AFTER THE WAR IN SOUTH AFRICA.

IN the *Fortnightly Review* for June, Sir Alexander Miller, writing upon "The Labor Problem in South Africa," pleads for the introduction of Hindu labor, of which the supply is practically inexhaustible, but he says that this cannot be done upon one-sided terms. He says the administration ought on no account to make itself responsible, directly or indirectly, for the supply of labor, but whatever steps can be taken short of violence or physical restraint to lead, drive, or push the natives into habits of industry and order ought to be adopted boldly and carried out unflinchingly, even though some of the measures may conflict with the unrestricted liberty so dear to the Anglo-Saxon.

#### HOW TO TAX THE MINES.

Mr. W. Bleloch calculates that the profits of the gold mines will average nine millions sterling (\$45,000,000) per annum. At 10 per cent. this would yield £900,000 per annum, at 15 per cent. £1,350,000. For the second period of ten years the profits would rise to £16,000,000 a year, 10 per cent. of which would give £1,600,000. Mr. Bleloch is strongly of opinion that the tax should

be a variable one, a changing percentage, rising and falling with the requirements of the government. He quotes figures to prove that there is little or no foundation for the cry that the 10 per cent. tax would bear hardly on the mines, provided, of course, that 5s. a ton can be saved upon the working costs. This, he thinks, is probable. In five years' time he calculates that, even after the 15 per cent. tax is paid, it is probable that the mines will be making two millions a year more than under the old system.

#### THE KAISER'S ONLY DAUGHTER.

IN the *Girl's Realm* for May there is an amusing article by Minka von Drachenfels on the most important little girl in Germany, a little girl, it seems, fully alive to her own importance,—Princess Victoria Louise of Prussia, born September 13, 1890. The Kaiser, speaking of his only daughter, has said more than once: "My daughter never forgets that she is the daughter of an emperor, but she often forgets that her father is the Emperor." The little princess is, however, devoted to her father, and her pride knew no bounds the first time she was allowed to drive out with him in the Tiergarten of Berlin.

"Very gravely, and with the utmost dignity, she returned the greeting of the people in the street. When, however, she looked up at her father, she almost smiled, and then again, as though conscious of what was expected of her, composed her features into the expression she thought proper for so great an occasion."

The Kaiser's two youngest children, Princess Luischen and Prince Joachim, generally play together, and almost always accompany their majesties when traveling. Two years ago, on arriving at Wiesbaden, the Kaiser and Kaiserin greatly delighted the crowd by driving to their Schloss with their children on their knees in the same carriage, although there were some complaints from those who had come long distances to see their sovereign, that they could not see the Kaiser because of the Princess Luischen's big hat. A story goes that once, when the two children were left alone together, they were driven through the village of Weimar, just then ravaged by a disastrous fire. It struck them that the best way to help the homeless people would be to write to their father; and by return of post came the imperial order to have the matter looked into, and help given.

The Kaiser's daughter is not, perhaps, quite so strictly brought up as her brothers; yet her lessons are never allowed to be interrupted. To her father's delight, she shows signs of becoming a good pianist, and is an excellent horsewoman.

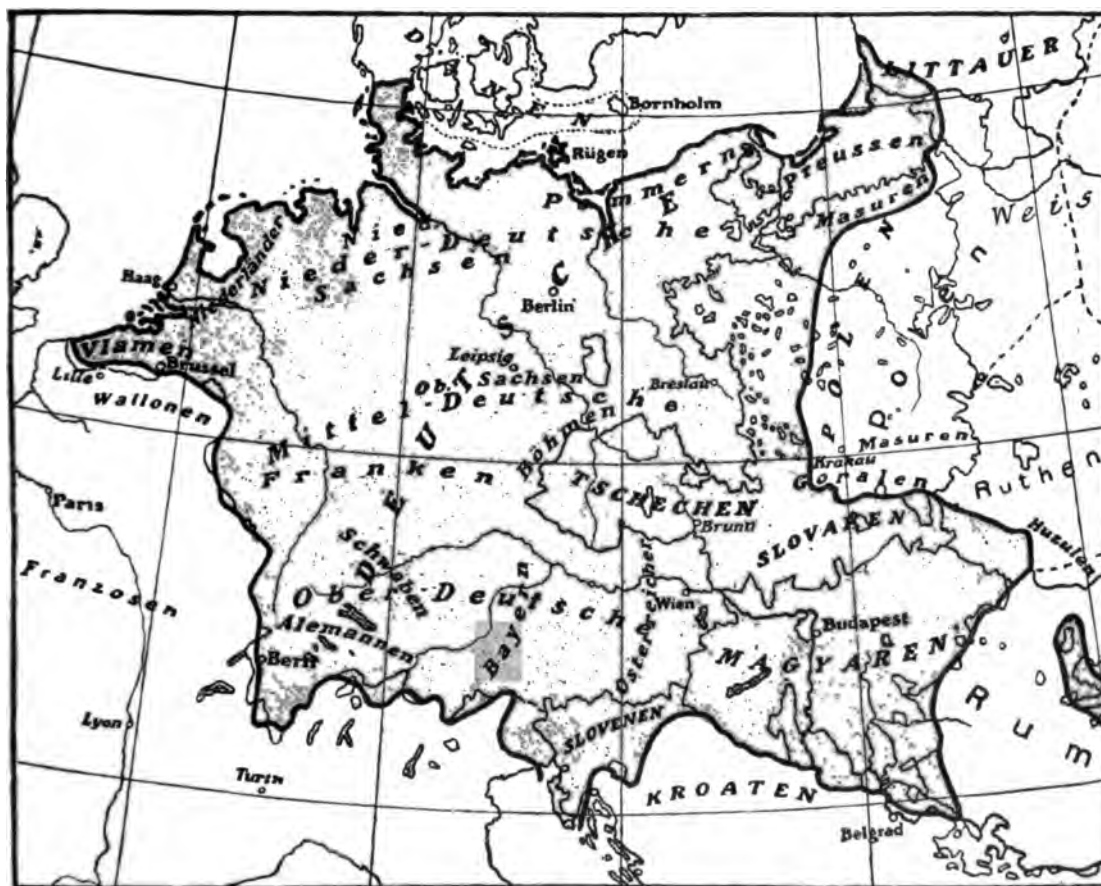

### THE PAN-GERMANIC MOVEMENT.

LOVERS of national unity will read with great pleasure the main facts presented by Sir Rowland Blennerhassett in the *National Review* under the heading "The Pan-Germanic." The anti-British feeling which the writer reports, and the anti-German feeling which he is at no pains to conceal, may be dismissed as the small dust of the balance. The great point disclosed is that the movement for the unification of the German Fatherland and of all who speak the German tongue still goes marching along; the glorious drama, of which Sedan and Versailles were only preliminary acts, still further unfolds itself.

In 1892 appeared a little book called "Ein Deutsches Weltreich" (a German world-empire), calling on all branches of the German race to work for political union. In 1894 was formed in consequence the Pan-Germanic League. In 1895 it had 7,700 adherents. Now it has 200 centers of propaganda. The map which is published in the *National* shows the nature of its aims. It is a map of the great German confed-

eration of 1950. The empire so formed is to comprise all Austria and Hungary except Galicia and the Bukowina, Trieste, Austrian Tyrol, German-Switzerland, Holland, and Belgium, and a piece of northern France. The eastern frontier shows only slight changes. The absorption of Holland is openly discussed in German newspapers generally. The Swiss-Germans have obscured their local patriotism with the "larger patriotism" of race and language. The movement *Los von Rom* is described by the writer as but another phase of the Pan-Germanic enthusiasm.

The writer laments that England has not a single cabinet minister who can read German with ease, and that consequently England does not understand the bitter enmity which Germans feel toward England. He insists that *Dolenda est Britannia* is the watchword of Pan-Germanism, and pleads that England prepare by suitable alliances, of which the Japanese is to him a welcome earnest, to worst Pan-German plans for the "annihilation" of England.

THE GREAT GERMAN CONFEDERATION OF CENTRAL EUROPE IN 1950. A FORECAST.

## THE RUSSIAN AWAKENING.

MR. FELIX VOLKHOVSKY contributes to the *Contemporary Review* an article under this heading. The greater part of his paper is taken up with the disturbances in the towns and villages, but he deals at length also with the alleged refusal of the soldiers to fire on the people,—a refusal which he regards as the chief factor in the Russian anti-governmental movement. He says that as soon as the rumors of the coming demonstration of March 3 (16) spread in St. Petersburg, the officers of the Cossack Bodyguard Regiment, headed by their commander, made a declaration to the home secretary that in case their regiment should be ordered to put down the demonstrators, they would obey in conformity with the military law, but would afterward resign their positions in a body.

Mr. Volkhovsky also says that twenty-eight soldiers were arrested in Poltava for refusing to fire on the peasants, and that an officer is being court-martialed for having ordered every tenth rifle to be loaded. The troops in general regarded their employment on what was strictly police duty as a degradation. Mr. Volkhovsky declares that in the Russian army there is none of the haughty military bully of Prussian manufacture, and the military insubordination is therefore a new impetus to the awakening of the citizen and Christian within the soldier.

Mr. Volkhovsky maintains that the anti-governmental propaganda has at last made progress among the peasantry. Large quantities of revolutionary literature had been smuggled into Russia and circulated among the peasants. The past liberalizing movements of Russia were ineffective only because the common people were indifferent. But all this is being changed, and the movement is now a popular one.

## THE LAST SOCIALIST CAMPAIGN IN FRANCE.

IT is too soon to discuss the effect of the last French elections on any political party, since the influence of the new Deputies cannot yet be estimated, nor can one be sure that the reelected members return to the Chamber with their convictions unmodified. M. Gustave Rouanet, in the *Revue Socialiste*, however, gives some noteworthy information as to the socialist campaign *per se*. This campaign, it will be remembered, resulted in the gain of six seats in the Chamber. "The socialist party," says M. Rouanet, "whose position, until recently, had seemed undecided and ill-defined, has at last found its equilibrium, and marked its definite place at the extreme left of democracy, from which it is separated as the special representative of the working classes, and

with which it is identified as a factor in the work of civilization and general progress, which marks the future of democracy in the history of the human race. In vain some socialists, with views more confused than profound, have endeavored to discern a continuity in the social development and historical evolution of the classes; the isolation they desired to impose on socialism was an impossibility inherent to the very nature of things. To oppose socialism to democracy was an absurdity which recent events have just demonstrated. The socialist-democrats and the socialists proper have been struggling together, in the course of the electoral period just terminated, with the most formidable social reactionary movement that ever agitated a country. And, by one of those ironies abounding in the history of all epochs, it was those socialists styled 'uncompromising' who, in a way, smoothed the path for the reactionary and demagogical coalition which was preparing to attack the Republic. It was these socialists who had coined the epithet 'anti-ministerial' just in time for the reactionary forces to adopt it as their countersign. But the logic of events is stronger than the bad faith of polemics. In fact, in the battle waged against democracy, the ardor of the assailants was excited, above all, by the thought that they led their forces at the same time against both democracy and socialism. The most objectionable feature in the anathematized government was the part taken by socialists in the defense of the Republic, and the citizenship won from the Republic by the socialists. The defeat of the cabinet meant preëminently the defeat of the socialist party; so that the dissenting socialists were led, naturally, to make common cause with democracy, and, with her, attempt to repulse the furious assaults of the enemy. Many accepted this situation frankly from the very first; others waited for the danger to become personal before they appealed to democratic unity. This second attitude, if not admirable, is only the more significant.

## INTERNAL DISSENSIONS.

"If the socialistic divisions were united by the exigencies of the situation, they none the less weakened the efficacy of our action by reason of the internal competitions to which they gave rise. By competitions I mean to say endeavors, made at different points to urge the voters to decide between the two methods and the two conceptions. Unfortunately, some intrigues took place so equivocal that this name could not be applied to them. In a certain number of districts, the socialist candidate 'proper' (to employ an expression much used by some cliques), was evidently the agent of the reaction,

and cynically joined in reactionary work. For the corruption of the socialist candidates was so extensive as to become singularly compromising for the honor of the party under whose auspices they had been politically launched. The attitude of some among them, who had previously given grounds for suspicion, revealed at the test of the ballot a visible accord with the reaction, so that *intransigence* in many quarters proved only the mask for deliberate treachery.

#### OPPOSITION OF THE NATIONALISTS.

"The traditionary revolutionarism of some candidates of the labor party grew more savage, and their invectives against the ministerial socialist more bitter, as the latter's position became more difficult to defend on account of the nature of the campaign carried on against him. The electoral arguments directed by the nationalists against democracy and socialism were clothed in all colors and borrowed from all programmes. Generally, in the labor centers,—the districts where the advanced element forms the bulk of the electoral body,—the nationalist candidate set up a decidedly revolutionary plan of action. His diatribes against the radical or socialist candidates leaving office were the same grievances laid at our door since the formation of the cabinet by the dissenting socialists. All the occurrences exploited to our detriment by the members of the Revolutionary Socialist Union were descanted upon afresh, and dwelt upon by the reactionary candidate.

#### SOCIALISTS BETWEEN TWO FIRES.

"Assured of the bulk of the votes controlled absolutely by the church and the aristocracy, the reactionary candidate brought all the resources of the demagogue to bear on those republicans and socialists who could be bewildered by his wordy oratory and the appearance of *intransigence* he affected. The candidate of the dissenting socialists seconded him admirably in this work of recruiting by authenticating by his testimony the accusations and calumnies formulated against the socialist candidate. . . . Despite these regrettable circumstances, socialism was enabled, by the double test of April 27 and May 11, to determine the increasing importance it has attained in this country.

"Although we suffered some crushing defeats, they were less so by the extent of the victory won by the enemy than, by the value of our partisans left on the electoral battle ground. But a struggle like that we have just passed through is never entered into without the risk of losing comrades,—even the most valuable and illustrious."

#### THE NATURE OF VOLCANOES.

IN what has been written and published, since the Martinique catastrophe, regarding volcanoes, the contribution of personal experience has been comparatively slight. Very few students seem to have had actual contact with volcanic phenomena. An exceptional instance is the article written by Prof. N. S. Shaler, of Harvard, for the June *North American Review*, which includes a most interesting narrative of a visit to the crater of Vesuvius during a slight eruption in 1882.

#### LOOKING INTO A CRATER.

Professor Shaler took advantage of a strong northwest wind, which inclined the materials thrown out of the crater to one side of the cone, and he approached the crater from the windward side. Although the cone was violently shaken by the successive explosions, Professor Shaler managed to reach the margin of the crater, and, with his face protected by a paper mask, it was possible for him to look down into the pit, and to see, perhaps, nearer to the seat of an eruption than any other geologist had been able to do. He describes the heat as almost unendurable, and the air as at times so charged with steam and sulphurous flames as to be suffocating. At most of the explosions Professor Shaler was thrown backward down the slope before he had a chance to note just what happened in the crater; but notwithstanding these unfavorable conditions, he was able to discern certain features which help to explain the processes of an eruption. These features he outlines as follows:

"The pit of the crater was several hundred feet in diameter and one or two hundred feet deep; there being nothing in view that would serve as a scale for measurement, its size could not be well determined. The inner slopes of the cavity led down, in the manner of a funnel, to a well-like shaft, about sixty feet in diameter, which descended nearly vertically. The upper part of the funnel was not hot enough to glow, but about the lower third it was of a dull red heat, and thence downward of a brighter hue, until, in the vertical shaft, it glowed like the eye of a furnace. About four or five times a minute, this shaft, usually empty, was partly filled with white, very fluid, hot lava, apparently as fluid as water, which rushed swiftly upward until it occupied the lower part of the crater to the depth of forty feet or more. Then the whirling pool swelled like a huge bubble, which burst open, so that the broken masses of lava were driven upward, as if shot from the mouth of a cannon. The action was very swift, so that from the time the lava came in sight in the shaft, perhaps fifty

feet below the base of the funnel, to the instant of the explosion was not more than three seconds. As soon as the discharge occurred, the lava not blown out fell back out of sight into the depths of the shaft.

#### STEAM THE MOTIVE POWER.

“Although, as before remarked, it was not possible narrowly to observe just what occurred at the moment of the successive explosions, for the reason that the shocks generally threw me away from the edge, some of them being less intense than others, I managed to get a sufficiently clear view of the process. It was evident that the explosion was due to the escape of gas or vapor at a very high tension. At the moment of explosion the cavity below the rent surface was apparent. The impelling vapor was at first perfectly transparent; in a moment, however, it took on a steel-gray hue, and in a second or two had the whitish color of steam. As the cloud swept about me, it was perfectly evident that it was the vapor of water with some sulphurous gas, and probably some chlorine and other gases. In four or five seconds the strong air currents due to the heat and the gale of wind drove the steam out of the pit, so that all parts of it were clearly visible. I reckoned the speed of ascent of the fragments that were cast upward as at least four hundred feet a second. The time that elapsed between the bursting of the bubble and the crash of the falling masses on the farther side of the cone indicated that they rose to the height of more than fifteen hundred feet above the point of discharge. My observations at the crater were suddenly interrupted by a lull in the gale which had made them possible. Masses of the lava, some of them as large as nail kegs, began to fall near me, so that I had to retreat, and that speedily. My valiant porter objected to my haste, saying that there was no grave danger, for the chunks of lava were *soft*!

“All that was visible in the crater whence this slight but instructive eruption came bore out the supposition that the motive power of volcanic outbursts is steam. Much else that could be seen was to the same effect. Thus, as the fragments of lava, whirled up at each explosion, swept through the air, their surfaces cooled, so that when they came back to the ground they had a darkened crust. As they burst open at the moment of contact with the earth, they visibly ejected steam. A small stream of lava flowing from the cone poured forth steam from every part of its surface. As the fragments sent up by the explosion rose in the air, they were enveloped in a cloud of steam, which, as it drifted away, yielded a little rain.”

#### THE AGENCY OF WATER.

If we assume that volcanic explosions are essentially due to the expansive force of steam at a very high temperature, the question at once arises, How does the water get access to the rocks? It is to be noted in this connection, as Professor Shaler points out, that all the active volcanic cones are either on islands of the sea or not more than three hundred miles inland. Professor Shaler finds the true basis of the relation of water to volcanic action in the following facts:

“Let us first note that, from the depths of the earth, heat in large quantities is constantly and everywhere passing forth into the cold spaces that wrap in the sphere. Each year enough heat thus creeps upward through the blanket of rocks, if it could be held in the crust, to raise the temperature of a layer of any ordinary stone a foot in thickness by some degrees of temperature. Now, beneath the sea-floor, strata are nominally accumulating at a geologically rapid rate; and every layer, because it is a non-conductor, serves to retain this heat, as does the mineral wool covering in a boiler or the ‘cosset’ on a teapot. The result is that a layer of rock laid down many geological periods ago on the cool surface of the ancient ocean floor, say at 40° Fahrenheit, if covered by successive strata to the depth of 100,000 feet, will acquire a very high temperature, probably somewhere near 2,000° Fahrenheit. We see by the remnants of strata which are exhibited on the land, that even much greater thicknesses of deposits may be heaped up over wide areas. Now, let us remember that, as beds of any kind are laid down in water, they are always made up of fragments; and between these bits are spaces which are filled by the fluid; and, furthermore, that the bits themselves are water-soaked. This water, as I have found by extended inquiry, amounts in different kinds of strapped rocks to from one-twentieth to one-fifth of their mass. Given this water, and the heat which must come to it with deep burial, and we have the fundamental conditions of a volcanic explosion,—conditions which do not exist beneath the lands where the blanket of strata is always wearing away (with the result that the temperature of the underlying rocks is ever lowering), and which exist only beneath the great water areas, where strata are accumulating, and, as a consequence, the deep-buried water is ever becoming hotter and ever straining more vigorously on the rocks that case it in.”

#### WHAT HAPPENED AT ST. PIERRE.

Professor Shaler regards the recent eruptions of Martinique and St. Vincent, frightful as they

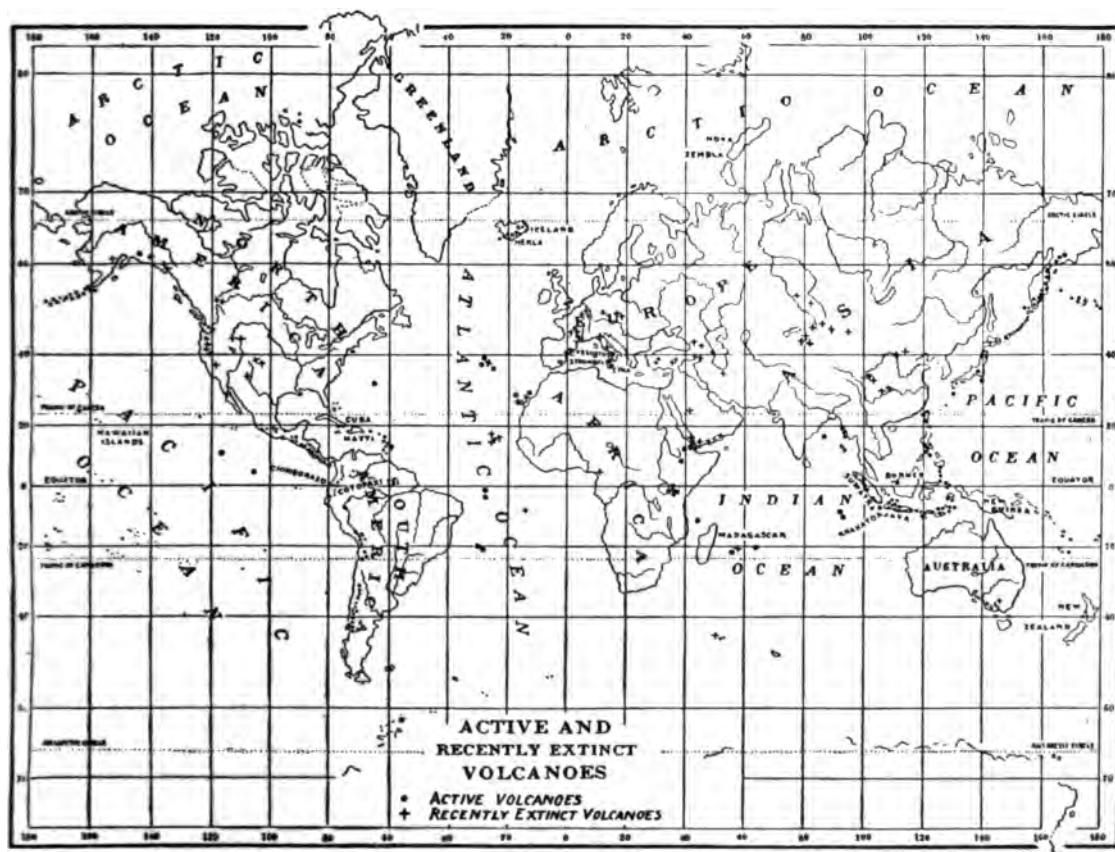

have been in their effect on human interests, as of relatively slight physical importance. The sounds of the eruptions were audible for a distance of no more than two hundred miles. In the case of Krakatoa, the explosions were heard two thousand miles from their source. The enormous loss of life is explainable on other grounds than the intensity of the eruptions:

"A glance at the position of St. Pierre in relation to the volcano which destroyed it shows that the city lay within four or five miles of the cone, and on the side whereto the prevailing winds would be likely to drive the vapor and ashes from the crater. The ash ejected appears to have been mainly of a coarse nature, and the quantity of volcanic bombs,—that is, masses of lava, which, whirling, take on a rudely spherical form,—more than usually great in quantity. The falling ash apparently served to force the heated air and steam down upon the surface, so that it flowed over the town; while the bombs,—molten lava within, though hard crusted without,—were as effective as hot shot in carrying

heat and setting fire. It is probable that, in this as in other eruptions from long-dormant volcanoes, much carbonic-acid gas, which had gathered in the caverns at the base of the cone, was mingled with the steam and sulphurous fumes, the whole forming an irrespirable air which quickly and mercifully suffocated the stricken folk. In some instances, this tide of mephitic vapors has been known to destroy all life for a radius of many miles about the point of discharge."

#### DISTRIBUTION OF THE WORLD'S VOLCANOES.

THE geographical distribution of active volcanoes has an important bearing on the scientific explanation of volcanic phenomena, as is fully brought out in Professor Shaler's discussion, quoted above. An interesting statement of facts regarding such distribution is presented in the *National Geographic Magazine* for June. From this compilation we extract the following data:

SKETCH MAP OF THE WORLD—SHOWING GENERAL DISTRIBUTION OF VOLCANOES.

From "Volcanoes of North America," by Israel C. Russell (The Macmillan Company).

There are from three hundred to three hundred and sixty volcanoes on the globe. This estimate includes merely live volcanoes and volcanoes which within recent times have been in action. If we should count the many mountains scattered over the earth which show to-day signs of volcanic action in the more remote past, the estimate would have to be increased by many hundreds.

#### THE PACIFIC OCEAN GIRDLED BY VOLCANOES.

Volcanoes would seem to be arranged, with more or less symmetry, in belts circling the great oceans. A ring of fire surrounds the Pacific. Starting at the South Shetland Islands, several hundred miles south of Cape Horn, a belt of volcanoes extends up the west coast of South America, Central America, and North America; from Alaska it crosses the Pacific along the Aleutian Islands to Kamchatka; thence it follows the east edge of the Pacific through the Kurile Islands, Japan, Formosa, the Philippines, the Moluccas, the Solomon Islands, the North Hebrides, New Zealand, and finally ends in Mounts Terror and Erebus, on the Antarctic Continent. The volcanoes forming this great belt are in places ranged in chains, as along the west coast of Central America and in the Aleutian Islands; elsewhere they are separated by long distances, but nevertheless they would seem to have some connection with each other. Sometimes the line of volcanoes surrounding the Pacific is very narrow, as in Central America, and then again it broadens hundreds of miles, as in the western United States, where extinct volcanoes on the east edge of the belt are hundreds of miles from the ocean and distant from each other.

Within this great Pacific circle of volcanoes, twenty-five thousand miles in length, are many volcanic islands: the Ladrões, the Hawaiian Islands, with the famous Mauna Loa; the Galapagos, the Samoan Islands, as well as the Tonga and Fiji archipelagoes, and many smaller groups. The coral islands may be also classed as volcanic, as they rest in great part on volcanic foundations.

Eastward from the circle around the Pacific, a branch belt extends through Sumatra and Java. On the broken isthmus which ages ago joined Asia and Australia are over one hundred volcanoes, many of which are constantly belching forth mud, lava, or ashes. This is the great focus of volcanic action of the earth.

#### VOLCANOES OF THE ATLANTIC REGIONS.

Round nearly three sides of the Atlantic basin volcanic districts are scattered with some apparent symmetry. In the far north, Hekla and nearly one score others separate the Atlantic from the Arctic Ocean. Stretching from Ice-

land, from north to south, an irregular submerged ridge bears the volcanic mountains of the Azores, the Cape Verde Islands, Ascension, St. Helena, and Tristan da Cunha. On the west edge of the Atlantic are the volcanoes of the West Indies; but north or south of the Antilles there is not a single volcano on the east coast of America. The volcanic belt of the Mediterranean shore is prolonged to the mountains of Armenia and western Arabia. There are said to be some volcanoes in Tibet and Manchuria, but the explorer has not yet located them.

Elisée Reclus has drawn attention to the fact that the great centers of volcanic action in the western and eastern hemispheres are at exactly opposite ends of the globe—are at antipodes to each other—and that these centers of activity are near the poles of flattening. They also flank, one on the west and one on the east, the immense circle around the Pacific.

Hekla, in Iceland, and Mauna Loa, in the Hawaiian Islands, simply pour forth masses of lava that flows like molasses. Vesuvius and Mont Pelée, on the other hand, represent the explosive type of volcanoes, to which also belong the volcanoes of the Andes and of Mexico.

#### WHAT THE ASTRONOMERS ARE DOING.

PROF. SIMON NEWCOMB says, in his article in the July *Harper's*, that no field of science has seen a greater progress in the past forty years than astronomy, and he proceeds to show what the great astronomers of the world are doing just at present to carry this progress still further.

#### PHOTOGRAPHING THE SUN.

At Greenwich Observatory the sun has been regularly photographed every clear day for more than twenty years, with a view of determining the changes going on in its spots. More recently observations from India and Mauritius have been added, so that now it is a rare day which does not see at least one new photograph taken. The object of this work is to explain the cycle of change in the sun-spots which goes through a period of about eleven years. No one has been able to establish the cause.

#### MAPPING THE HEAT RAYS OF THE SUN.

"Professor Langley, at the Astro-Physical Observatory of the Smithsonian Institution, has just completed one of the most important works ever carried out on the light of the sun. He has for years been analyzing those of its rays which, although entire invisible to our eyes, are of the same nature as those of light, and are felt by us as heat. He invented a sort of arti-

ficial eye, which he called a holometer, in which the optic nerve is made of an extremely thin strip of metal, so slight that one can hardly see it, which is traversed by an electric current. This eye would be so dazzled by the heat radiated from one's body that, when in use, it must be protected from all such heat by being inclosed in a case kept at a constant temperature by being immersed in water. With this eye Langley has mapped the heat rays of the sun down to an extent and with a precision which were before entirely unknown.

#### CATALOGUING THE STARS.

As there are about 100,000,000 stars discernible through modern telescopes, it is a large task to study every one of them, but astronomers are doing their best in assigning the proper position and arrangement of the greatest possible number in their study of the structure and extent of the universe. The great national observatories are working on a catalogue giving the precise positions of the brighter stars, and up to the present time about 200,000 visible in our latitudes have been catalogued. In the southern hemisphere, Sir David Gill, astronomer at the Cape of Good Hope, and other scientists are hard at work on the stars not visible in our latitudes.

In the mere matter of listing the stars there is an enormous amount of work. Four hundred thousand have been listed in the last half a century at the observatory at Bonn. Dr. Thorne, in the Argentine Republic, has listed a half million. As to the stars which it is impossible to handle individually, there is an association of observatories engaged in making a photographic chart of the sky on the largest scale. When the observatories all over the world have handed in their work, we shall have a picture of the whole sky, the labor of an entire generation of astronomers.

#### MEASURING THE DISTANCE OF THE STARS.

Most of the heavenly bodies are so far away that even the most expert astronomers find it impossible to measure their distance through the only means at hand,—that is, the slight change in the direction of the star produced by the swing of the earth around its orbit,—and there are probably not yet a hundred stars of which the parallax has been closely obtained.

Professor Newcomb tells of the wonderful perfection of the spectrograph, used to measure the speed of the stars approaching or receding. Our own moon is one of the enigmas of the astronomer. She is moving from her appointed place, and the deviation is increasing; but astronomers cannot account for it. Jupiter has been shown to be a miniature sun, and the suspicion that the

earth's axis of revolution varied from time to time has been verified.

#### THE SUCCESS OF AMERICAN ASTRONOMERS.

"A fact which will appeal to our readers on this side of the Atlantic is the success of American astronomers. Sixty years ago it could not be said that there was a well-known observatory on the American continent. The cultivation of astronomy was confined to a professor here and there, who seldom had anything better than a little telescope with which he showed the heavenly bodies to his students. But during the past thirty years all this has been changed. The total quantity of published research is still less among us than on the continent of Europe, but the number of men who have reached the highest success among us may be judged by one fact. The Royal Astronomical Society of England awards an annual medal to the English or foreign astronomer deemed most worthy of it. The number of these medals awarded to Americans within twenty-five years is just about equal to the number awarded to the astronomers of all other nations foreign to the English. Of its fifty foreign associates chosen for their eminence in astronomical research, no less than fourteen are Americans."

#### THE NEW STAR IN PERSEUS.

ONE of the most remarkable discoveries of the year 1901, astronomers say, was that of the brilliant new star in the constellation Perseus. On the night of its discovery, February 21, this star was nearly as bright as the brightest of the stars of the Great Dipper; two evenings later it had become the brightest of all the stars in the sky. Since that time the new star has been slowly fading away.

#### WHAT CAUSED THE OUTBURST OF LIGHT?

Several theories as to the sudden appearance of this new star are suggested in an article contributed to the *Journal of Geography* for May by Mr. Eric Doolittle, who says:

"It may be that it resulted from the collision of two dark suns, rushing toward each other under their mutual attractions with an inconceivable velocity. The impact would have been sufficient to vaporize and raise to incandescence much of the material of which the bodies are composed.

"Or, it may be that two suns having a more or less solid crust, passed near each other merely. In this case their mutual attractions would distort their figures and break up the crust of each star, thus liberating the pent-up, superheated

PHOTOGRAPH OF THE NEBULOSITY ABOUT NOVA PERSEI IN SEPTEMBER, 1901, BY C. W. RITCHEY; TWO-FOOT REFLECTOR, YERKES OBSERVATORY. EXPOSURE, 3 HR. 50 M.

(The concentric rings of nebulous matter are very strongly marked; it was from the measures on the sharper points to the right that the remarkable motion was discovered from this photograph. The rays of light emanating at right angles from the principal star are merely an optical effect arising from interference of rays in the reflecting telescope.)

gases within, which would then burst forth with great energy.

"It is also possible that the crust of a dark star became torn and broken simply through the natural shrinkage of the star itself, and that the imprisoned gases rushed out, and by their glow, combined with that produced by chemical union with the atmosphere of the body, created a great outburst of light.

"And finally, to these several theories may be added another explanation, equally plausible, namely, that the outburst was caused by the passage of a dark star through a cloud of cosmic material. Such clouds exist in great numbers in the sky, and it is at least possible that the friction would have been sufficient to raise the mass of cold matter to white heat, and then to change it into an incandescent vapor and possibly into the dissociated gaseous state, all in a few weeks or days."

#### THE NEW STAR AND ITS NEBULA PHOTOGRAPHED.

A photograph of the new star, secured by Mr. G. W. Ritchey, of the Yerkes Observatory, on September 20, 1901, showed it to be surrounded by a nebulous cloud extending to a great distance from the center. A comparison of this photograph with a similar one secured six weeks later by Professor Perrine, of the Lick Observatory, showed that the nebula was in extremely rapid motion away from the central star.

"Even were the star as near as the nearest of the fixed stars, this motion would be so great as 1,640 miles a second. But measures of the parallax, by means of the micrometer and heliometer, indicate that the distance is at least sixty or seventy-five times as great as the velocity of light. It has been suggested that the central star may be surrounded by a nebulous cloud, and that the particles of which this cloud is composed become visible to us as they are successively illuminated by the light emanating outward from the central star. In other words, that we here actually see the light traveling outward with the inconceivable velocity of 186,330 miles a second. Whether this is the case or not, it seems improbable that it can be actual material

which is being ejected from the central star with this velocity."

The sudden formation of such a nebula is a phenomenon new to astronomers.

#### HOW THE GOVERNMENT AIDS PRIVATE OWNERS OF FORESTS.

IN *Harper's* for July, Mr. Overton W. Price, of the National Bureau of Forestry, has an interesting account of the work done by the United States Department of Agriculture in co-operating with the private owners of forests. There are now on hand applications for expert advice in the handling of over three million acres of private forest, the result of a circular issued in October, 1898, offering assistance to farmers, lumbermen, and others in the management of their forest lands. Mr. Price says that it is no longer necessary to argue with private

owners concerning the value of scientific forestry. The only difficulty is to find trained men to put the principles of forestry into effect. The worst error of the private owner in the unscientific treatment of the forest is his ignoring its productive capacity. Immature trees are not cared for, and the forest is not able to reproduce itself. Mr. Price explains that practical forestry is always a compromise between what should be done for the good of the forest and what is necessary to do in order that the property may yield a fair return on the capital it represents.

#### THE YOUNG GROWTH IS WORTH SAVING.

The attempt of the national government to cooperate with private owners of forests was begun in the Adirondacks in 1898. It was based on a careful preliminary study on the ground, by which the financial soundness of lumbering spruce with a view to taking a second crop in the same area, was established. In other words, it was found by measurements of the number of mature and immature spruce trees, and by a study of their habit and rate of growth, that the return from lumbering renders it profitable to protect spruce trees of less than merchantable diameter, and to favor the reproduction of the tree.

#### THE RULES OF SCIENTIFIC LUMBERING.

"It was found that the customary method of logging spruce seriously impairs the advantage of holding the logged-off area for a second crop, through its great attendant damage to small trees and young growth generally. It was, therefore, necessary to so modify this method that without encroaching too far upon present profits the productive capacity of the forest might be preserved. Rules were drawn up to govern lumbering, the main objects of which were the following:

"The leaving of a sufficient number of seed-bearing spruce in the forest to invite reproduction, and of those smaller trees which, although of merchantable size, can be harvested much more profitably when they have reached a larger diameter.

"The elimination of all unnecessary waste of merchantable timber, as in high stumps, lodged trees left in the woods, and failure to run the logs well up into the tops.

"The avoidance, wherever practicable, of damage to young growth.

"It is believed that the application of these rules by a large paper company to its own lands in Maine is the strongest argument in their favor which has yet been made. The purpose and practice of forestry on lands of private ownership in the Adirondacks are fully described in Bulletin 26 of the Bureau of Forestry,—*"Practical*

*Forestry in the Adirondacks,"* by Mr. Henry S. Graves, now director of the Yale Forest School.

#### PRACTICAL EXAMPLES FOR PRIVATE OWNERS.

"The cooperation which is now carried on between private owners and the Bureau of Forestry has been undertaken with the belief that example will prove more powerful than precept in the institution of improved methods upon private forest-lands. It is intended to provide practical examples which show that conservative lumbering not only leaves the forest in better condition than does ordinary lumbering, but that it is usually a sounder financial policy. There has been in this country a good deal of severe criticism of lumbermen and lumbermen's methods which has done the cause of forestry no good. The American lumberman will not modify his methods until he has been shown that it is profitable for him to do so.

#### THE FORM OF COÖPERATION.

"In the cooperation between the Bureau of Forestry and a private owner, the first point to be decided is whether the application of forestry will be profitable upon the forest-land in question. A preliminary examination is accordingly made by a forester, the result of which is embodied in a report to the owner. If the conditions be favorable, a working-plan is then made, should the owner desire it. This working-plan is a comprehensive and detailed scheme for the management of the forest. It forecasts the profits from lumbering and the present yield of merchantable timber. It fixes the diameter limit to which trees shall be cut, and prescribes all modifications of ordinary logging methods which are practicable and profitable in hastening the production of a second crop. It states how large this second crop will be in a given number of years, estimates the cost to the owner of obtaining it, and sums up what will be the result of conservative forest management from a business point of view. The working-plan entails careful measurements of the stand of merchantable timber, and of the number and size of immature trees. It includes a thorough study of the habits and rate of growth of the local trees, and the effect of lumbering upon the forest, and of those modifications of ordinary methods which are both silviculturally and financially advisable. Based upon this study on the ground, the working plan is a plain statement of the most profitable way in which a forest may be handled for its own good and for the good of the owner."

Owners of wood-lots and forest lands, from a few acres to thousands of acres, all over the United States, are eagerly availing themselves of this valuable aid.

## THE MEN OF THE [LONDON] "TIMES."

THE *Caxton Magazine* for May has an illustrated article on "The Men of the *Times*," by Mr. J. C. Woollan. The three chiefs of the *Times* who are dealt with are Mr. Walter, Mr. G. E. Buckle, and Mr. Moberley Bell. Mr. Buckle has been editor of the paper for no less

MR. G. E. BUCKLE.  
(Editor of the *London Times*.)

than eighteen years, having been only twenty-nine years old when called to the editorial chair in 1884. Mr. Woollan says that he was chosen chiefly because he had large mental gifts which had been highly cultivated, and had, moreover, most excellent talent for expressing himself in good English. Mr. Buckle's enthusiasms are golf and privacy, the latter being no doubt the reason why

he is so little known in the general world. The other strong man behind the *Times* is Mr. Moberley Bell, who is officially described as assistant-manager, but whose position is a very different one. Mr. Bell was formerly *Times* correspondent in Egypt, having inherited that post from his father. Mr. Bell has been described as the "De Blowitz of Egypt," and he has been credited with being the original author of the British occupation. Judging from what Mr. Woollan says, the *Times* is by no means under the control of old Tories. Mr. Moberley Bell is a Liberal-Unionist, while Mr. Buckle is a member of the Reform Club, which fact is given as "a hint as to his personal politics."

## MAXIM GORKY.

MAXIM GORKY, "a new star in the firmament of Russian literature that has excited much attention not only in Russia, but also in other countries," is the subject of an article by M. von Brandt in the *Deutsche Rundschau* for May. The writer is not sure whether Gorky will turn out to be a fixed star, or will eventually dwindle down to a star of smallest magnitude after a brief period of brilliance. But the question is immaterial, since Gorky is, in any case, interesting as a product of his surroundings.

Maxim Gorky,—i.e., "the Bitter,"—was born March 14, 1868, at Nishni Novgorod, the son of a paper hanger. He lost both his parents at the

age of five; four years later he was apprenticed to a shoemaker by his grandfather, a dyer. The boy soon ran away, and for fifteen years thereafter he led a wandering life. He tried his hand at many occupations to support himself, but never staid long enough in one place to gain a foothold. However, during these years he unconsciously gathered the material he was to use later on for his stories. His education he gained through omnivorous reading, to which he was first directed by a cook on a Volga steamer, where he served as scullion. His first literary attempt was a story, "Makar Tschudra," that appeared in 1892 in a magazine at Tiflis, where he was working in a railroad shop. The success of this story determined his career.

Gorky, with his antecedents, would naturally be in sympathy with the movements of the Russian people, that now and again find expression in the student riots. Attracting the attention of the police by his last works and his intercourse with suspected persons, he was arrested this year at Nishni, but soon liberated, and is now living in the Crimea, under police surveillance, it seems. Gorky, as an exponent of the life of the Russian people, takes a place in its literature, the tendencies of which he exemplifies.

## TENDENCIES OF RUSSIAN LITERATURE.

"Russian literature in its normal development for the last fifty years, and even more on its abnormal side, is the product of the view of life of the great mass of the Russian people that has remained entirely untouched by western European ideas. The vague, dreamy longings of the inhabitant of the steppes, who has scarcely come under the influence of culture, the unconscious groping for more truth and light which has for centuries produced innumerable sects within the Russian Church, and finally the Russian peasant's love for the soil,—these have given to Russian literature its local color and its power. The outlook upon 'little Mother Volga,' the mighty river, the immense steppes, and the still more immense sea, the attempt to fathom the heart of the peasant, which is unfathomable, as everything that is not bounded by knowledge,—these have given to Russian literature that dreaminess, vagueness, and undefinableness that exerts such great charm upon the Russian himself, and is even influencing the more critical West-European. Tolstoy is in this respect the most characteristic figure of modern Russian literature."

## GORKY'S COMMUNISTIC VIEWS.

Gorky is a product of the communistic tendencies of Russian socialism and of the moral conditions of the Russian people. "Brandy plays

a large part in his stories ; but he also expresses admirably the vague longing for something higher, that seems to fill every Russian of the lower classes, the love and comprehension of the broad expanse of the steppes and the sea, for what we might call the distant, which drives the peasant from his glebe and the vagabond from the work just found, the chasm that divides the tramp from the breadwinners and the proprietors. . . . Hatred against ownership, and perhaps even more against work that produces more than the mere daily bread, is the red thread running more or less distinct through all of Gorky's work, and which gives to it its socialistic color. This is most apparent in the novel 'Foma Gordjejew.' . . . These communistic-socialistic views, though neither very intellectual nor especially new, evidently characterize the point of view that Gorky himself takes, or that he presupposes in the majority of his readers. Hence they deserve more attention than they could otherwise claim, as they also are subject to the old error that only manual labor is work, a point of view that corresponds to a low state of culture, but that would hardly obtain in a more advanced state of society."

#### A RUSSIAN REALIST.

Von Brandt sums up his impressions of Gorky as follows : "Gorky's stories display great power,—and one is often tempted to add, great beauty,—in spite of the unpleasant material, so long as he tells of what he has seen and felt himself. But when he goes into psychological questions, as in 'Foma Gordjejew,' he weakens or sinks into the mud of the French immoral novels. As long as he remains Russian he gives us at least a faithful description of the lower, or perhaps the lowest, classes of the Russian people. His figures have the advantage of being true to life. They are not appetizing ; they smell of sweat, brandy, rags, and misery, and the lack of soap and water is unpleasantly apparent ; but they are people of flesh and blood, and not pale phantoms. Hence the reading of his works is not such a trial to the nerves as that of many other products of the northern school. We are moved, and may even turn with disgust from many of his creations, but we must admit that he has gone straight to the life of the people, leading us to the depths, if not to the heights. If it had been his intention to represent to us the classes that he has drawn as being ready for liberation, we should have to designate the attempts as a failure ; on the contrary, he has placed many of the measures of the Russian Government in a clearer light. His works so far have given no proof that he is equal to the task of exerting an

educative influence on his people. His story, 'A Curious Reader,' seems to indicate that he himself has sometimes doubts as to his work and his powers. He here speaks of the bitter hatred that is continually smouldering in his soul, but also of the doubts that beset him, he and his kind being 'like torches that burn fitfully by the grace of Satan, the smoke they send out penetrating deep into the mind and heart, saturating them with the poison of disbelief in one's self.'"

#### IN PRAISE OF THE CHINESE.

A THOROUGHGOING eulogist of China is Prince Ukhtomsky. He contributes to the *Contemporary Review* an article on "The Genius of China," which is enough to make us all weep that we were not born Chinese. Prince Ukhtomsky has been in China many times, and has fallen in love with the yellow man. He believes in him down to the ground, and in this article he ventures to prophesy various things which, when they happen, will occasion disturbances in the world at large.

#### THE EXPANSION OF CHINA.

China is something so immense and potent that it is impossible to foresee to what it may grow within a few decades. It is certain that the current of modern life will drag China into its strenuous whirlpool, will stir up and stimulate the naturally good-natured giant to demand a proportionate share of power, glory, and wealth, of success and weight in the assembly of nations. Already the yellow race begins to struggle with difficult problems ; and in the twentieth century, whatever it may cost, China will acquire as natural colonies Annam, Cochin-China, with Cambodia, Siam, and Burmah, the great Malay regions, Formosa, the Philippines, Borneo, Sumatra, and Java. Whoever rules China, it will certainly in time acquire a formidable fleet, and then the struggle for existence will follow its course with pitiless logic. The Chinese have energy, sagacity, and capital. Until the year 1400, China kept a whole generation ahead of Europe. Since then she has fallen behind, perhaps some thirty years. But she is waking up. There are no signs whatever of decline or decrepitude. Unable to repel the invading foreign devils, they have made themselves indispensable to the newcomers, and man-aged in a certain sense to bind them hand and foot. Already being unrivaled in the field of commercial resourcefulness, the Chinese little by little crowd out the foreigners from their territory, and the time can hardly be far distant

## FACULTY.

As the standard of "a small college with a full classical course and adequate provision for a reasonable amount of instruction in modern languages and natural science," Professor Henderson gives the following estimates :

Faculty.	Medium cost.
Psychology, philosophy, ethics—one professor.....	\$2,500
History and sociology—one professor.....	1,800
Economics and politics—one professor.....	1,800
Greek—one professor.....	1,800
Greek—two assistants at \$900 each.....	1,800
Latin—one professor.....	1,800
Latin—two assistants at \$900 each.....	1,800
English—one professor.....	1,800
English—two assistants at \$900 each.....	1,800
French—one instructor.....	1,000
German—one instructor.....	1,000
Mathematics, chemistry, and physics—one professor.	1,800
Mathematics, chemistry, and physics—two assistants at \$900 each.....	1,800
Biology, zoology, botany—two instructors.....	2,000
Music—one instructor.....	1,000
Drawing—one instructor.....	900
Pedagogics must now be provided for—one professor.	1,800
Elocution—one instructor.....	1,000
Physical culture—one instructor.....	800
	<b>\$31,000</b>

These estimates call for a faculty of eight professors and sixteen instructors or assistants, twenty-four teachers in all. It is assumed that not more than twenty-five students shall be taught in one class. A smaller number of teachers, it is believed, cannot do the work thoroughly, and lower salaries would probably result in the loss of the best teachers.

## EQUIPMENT.

Professor Henderson estimates the cost of equipping a college with apparatus for instruction in the elements of chemistry, physics, and the biological sciences as follows :

Chemical laboratory.....	\$5,000
Physical laboratory.....	5,000
Biology, including botany and zoology.....	\$5,000 to 9,000
A good library, selected and purchased (not a collection of patent-office reports, etc.), at least.....	40,000
The annual additions should be at least.....	1,000

These estimates do not include cost of buildings.

The annual budget of such an institution would be approximately as follows :

Cost of instruction.....	\$31,000
Cost of library.....	1,000
Cost of repairs and improvements.....	2,000
Cost of additions to apparatus.....	1,000
Cost of care of buildings and grounds.....	1,000
Cost of insurance.....	500
Cost of financial administration.....	1,000
Total annual disbursements.....	<b>\$37,500</b>

## INCOME.

Endowment fund, at 3 per cent.....	\$12,000
Gifts and fees of students, at \$50 per year.....	10,000
Gifts and fees of graduates at \$5 per year.....	1,000
	<b>\$23,000</b>

This would leave a deficit of \$14,500 to be made up by annual gifts until the endowment fund can be very materially increased. As a matter of fact, scores of institutions having inferior resources to those outlined above are now conferring college degrees in this country, but the tenor of Professor Henderson's article goes to show that they do not and cannot meet modern requirements.

## A CENTURY'S LOSS IN GAMBLING.

"**M**ONEY Lost by Gambling" is the title of a paper by Mr. W. Greenwood in the *Sunday Strand*. It resumes the tragedy of the turf as enacted in the lives of plungers like the notorious Marquis of Hastings, who lost the weight of two race horses in gold in a single race, but builds chiefly on the estimate given in the following paragraph :

"It is, for obvious reasons, impossible to arrive at the exact amount of money squandered in betting every year ; but not long before his death, it was stated on the authority of Mr. Mulhall, the most famous of latter-day statisticians, that during the last hundred years no less a sum than £3,000,000,000 (\$15,000,000,000) had been won and lost on the turf and at the card-table ; and there are many well-qualified judges who would say that this is rather an underestimation than an exaggeration."

This total is estimated to equal in weight 66,000 race horses. It would, if portioned out among the British army in South Africa, give each soldier a load of 2 cwt. of gold. It would require ten strong locomotives to pull it. "A century's betting money would form a rectangular column of sovereigns ten feet square, and more than twice as high as St. Paul's Cathedral." Invested, the sum would have yielded £90,000,000 (\$450,000,000) a year. The calculations and illustrations are ingenious and suggestive.

## THE DEADLY AUTOMOBILE.

**R**ECENT fatal accidents,—if such they may be termed,—resulting from the speeding of automobiles in the vicinity of New York City, have drawn public attention to this new peril, and may serve to crystallize public sentiment into a demand for the more rigid enforcement of existing laws, if not for the enactment of new measures that will more effectually safeguard the lives of pedestrians and others who venture on the public highways.

## DANGERS OF UNRESTRICTED AUTO-DRIVING.

Some of the dangers that follow in the wake of the recklessly driven "autos" on many city

when all the import and even the export trade will be in the hands of Chinamen, whose diligence is exemplary, and who rapidly learn and master every industry. The day must surely come when America, England, Sweden, and Germany will cease to be necessary to China, grown aware of her own boundless resources.

#### A PHILOSOPHY OF HISTORY.

Prince Ukhtomsky maintains that the Russians alone, of all foreign nations, are regarded by the Chinese as their friends. He quotes a story told by the Russian poet, Maikoff, which tells how he once asked the Kirghiz Sultan Vailkhanoff what was his philosophy of history. He answered, "God Almighty gave the sovereignty of the earth to my ancestor, Jenghis Khan. For our sins it has been taken away from his descendants and given to the White Czar. That is my philosophy of history." It is not quite clear, however, whether the White Czar means the Son of Heaven or the Russian Czar. It is possible that Prince Ukhtomsky may expect that the Russian Czar will become the ruler of China, and so acquire a double right to the title of the Son of Heaven, which included the idea of White Prince, White Czar.

#### RUSSIA AS CHINA'S SAVIOUR.

The prince says western Europe has broken a terrible breach in the great wall of China, spiritually considered :

"Who and what can save China from falling entirely under the foreign yoke? We believe Russia alone can. From Russia's example the Western peoples will learn to understand and value an active faith which gives peace not less than Buddhism with its assuagement of the rebellious will, and, at the same time, brings the gladdening dawn of man's regeneration. This is the key of our unique success, unparalleled in history in subjecting kingdom after kingdom, not merely by open hostility and military achievement, but also by the secret powers of emotional sympathy and the irresistible necessity under which we lie of finding in every intelligent creature of whatever race, of whatever race, a comrade and brother with equal rights before God and the Czar."

He dreads the possibility of Great Britain converting the yellow man into a sepoy, and he declares boldly that the chief problem of Russia in the yellow East is to guard against such possibilities.

#### CHINESE VIRTUES.

Leaving the political question of the future relations of China to the great powers, Prince

Ukhtomsky waxes eloquent in praise of the Chinese. He denies indignantly that they are indifferent to religion and believe in nothing. The veneration of departed parents and ancestors, the recognition of the existence of their forefathers as living spirits who are able to enter into communication with their descendants, takes the place of religion. They see the presence and activity of spirits in everything. There is not a kingdom in the world where learning is so highly esteemed and revered as in China. Every scrap of paper marked with hieroglyphics is honored by the Chinese. A Chinaman is ready to study with incredible industry up to any age, overcoming the greatest obstacles. The respect of the people and of the authorities to those who have shown special assiduity and intelligence is extended also to their parents for having given birth to sons so useful for their country. The Chinese administration consists of an incredibly small number of persons of at all important rank. For the whole colossal empire there are only 9,000. The representative of power temporarily appointed is to such an extent identified with the population intrusted to his charge that he has sometimes to suffer a heavy penalty for crimes committed within the region intrusted to him, and he is repeatedly fined for the misdoings of others. He is guilty before the Son of Heaven for floods, droughts, famines, fires, and other natural calamities.

#### BUDGET FOR A SMALL COLLEGE.

WHAT shall be done with the small college? is a question that has been freshly brought to mind during the commencement season just closed. Dr. D. K. Pearsons has done something toward the solution of this problem, as was shown in the character sketch published in the *REVIEW OF REVIEWS* for November, 1901, but all the small colleges of the country have not shared in his bounty, and many such are confronted by a crisis that seems to involve their very existence.

In the discussion of the place of the traditional small college in our educational system that has been in progress for several years nothing has been more noticeable than the absence of any recognized standard of equipment or expenditure for such an institution. An attempt to supply data of this character is made by Prof. Charles R. Henderson, of the University of Chicago, who offers, in the *American Journal of Sociology* for May, a series of estimates based on his own experience in the administration of a small college, and a comparison with the experience of others similarly situated.

## FACULTY.

As the standard of "a small college with a full classical course and adequate provision for a reasonable amount of instruction in modern languages and natural science," Professor Henderson gives the following estimates :

Faculty.	Medium cost.
Psychology, philosophy, ethics—one professor.....	\$2,500
History and sociology—one professor .....	1,800
Economics and politics—one professor.....	1,800
Greek—one professor.....	1,800
Greek—two assistants at \$900 each .....	1,800
Latin—one professor .....	1,800
Latin—two assistants at \$900 each.....	1,800
English—one professor .....	1,800
English—two assistants at \$900 each.....	1,800
French—one instructor.....	1,000
German—one instructor.....	1,000
Mathematics, chemistry, and physics—one professor.	1,800
Mathematics, chemistry, and physics—two assistants at \$900 each.....	1,800
Biology, zoölogy, botany—two instructors.....	2,000
Music—one instructor.....	1,000
Drawing—one instructor.....	900
Pedagogics must now be provided for—one professor.	1,800
Elocution—one instructor.....	1,000
Physical culture—one instructor.....	800
	<b>\$31,000</b>

These estimates call for a faculty of eight professors and sixteen instructors or assistants, twenty-four teachers in all. It is assumed that not more than twenty-five students shall be taught in one class. A smaller number of teachers, it is believed, cannot do the work thoroughly, and lower salaries would probably result in the loss of the best teachers.

## EQUIPMENT.

Professor Henderson estimates the cost of equipping a college with apparatus for instruction in the elements of chemistry, physics, and the biological sciences as follows :

Chemical laboratory.....	\$5,000
Physical laboratory.....	5,000
Biology, including botany and zoölogy.....	\$5,000 to 9,000
A good library, selected and purchased (not a collection of patent-office reports, etc.), at least.....	40,000
The annual additions should be at least.....	1,000

These estimates do not include cost of buildings.

The annual budget of such an institution would be approximately as follows :

Cost of instruction.....	\$31,000
Cost of library.....	1,000
Cost of repairs and improvements .....	2,000
Cost of additions to apparatus.....	1,000
Cost of care of buildings and grounds.....	1,000
Cost of insurance .....	500
Cost of financial administration.....	1,000
<b>Total annual disbursements.....</b>	<b>\$37,500</b>

## INCOME.

endowment, \$300,000, at 4 per cent. ....	\$12,000
From tuition fees of 300 students, at \$50 per year.....	10,000
From other fees, 200 students at \$5 per year. ....	1,000
<b>Total annual income.....</b>	<b>\$23,000</b>

This would leave a deficit of \$14,500 to be made up by annual gifts until the endowment fund can be very materially increased. As a matter of fact, scores of institutions having inferior resources to those outlined above are now conferring college degrees in this country, but the tenor of Professor Henderson's article goes to show that they do not and cannot meet modern requirements.

## A CENTURY'S LOSS IN GAMBLING.

"**M**ONEY Lost by Gambling" is the title of a paper by Mr. W. Greenwood in the *Sunday Strand*. It resumes the tragedy of the turf as enacted in the lives of plungers like the notorious Marquis of Hastings, who lost the weight of two race horses in gold in a single race, but builds chiefly on the estimate given in the following paragraph :

"It is, for obvious reasons, impossible to arrive at the exact amount of money squandered in betting every year ; but not long before his death, it was stated on the authority of Mr. Mulhall, the most famous of latter-day statisticians, that during the last hundred years no less a sum than £3,000,000,000 (\$15,000,000,000) had been won and lost on the turf and at the card-table ; and there are many well-qualified judges who would say that this is rather an underestimation than an exaggeration."

This total is estimated to equal in weight 66,000 race horses. It would, if portioned out among the British army in South Africa, give each soldier a load of 2 cwt. of gold. It would require ten strong locomotives to pull it. "A century's betting money would form a rectangular column of sovereigns ten feet square, and more than twice as high as St. Paul's Cathedral." Invested, the sum would have yielded £90,000,000 (\$450,000,000) a year. The calculations and illustrations are ingenious and suggestive.

## THE DEADLY AUTOMOBILE.

**R**ECENT fatal accidents,—if such they may be termed,—resulting from the speeding of automobiles in the vicinity of New York City, have drawn public attention to this new peril, and may serve to crystallize public sentiment into a demand for the more rigid enforcement of existing laws, if not for the enactment of new measures that will more effectually safeguard the lives of pedestrians and others who venture on the public highways.

## DANGERS OF UNRESTRICTED AUTO-DRIVING.

Some of the dangers that follow in the wake of the recklessly driven "autos" on many city

streets and suburban roads are hinted at in an article on "Vexations of City Pedestrians," contributed by Mr. Louis Windmüller to the spring number of *Municipal Affairs*:

"Ordinances which restrict their speed to eight miles an hour in cities are seldom heeded. The most flagrant violations rarely are punished with adequate severity. Gliding noiselessly and swiftly over smooth pavements, these vehicles are apt to run down the unfortunate who may cross their paths. In turning corners they seldom reduce speed to the rate ordained by law. Frequently they collide before they can signal their approach. The cyclist on such occasions is apt to suffer with the pedestrian, and consequently is more careful than the chauffeur, who relies on the superior strength of his vehicle. Of horseless carriages driven at reckless speed, the greater number circulate in suburbs of French cities. The driver of one who had made a run of some hundred kilometers an hour in a race near Paris, when recently called upon to explain some accidents laid to his charge, could remember the jolting of his wheels, 'but had no time to stop for investigation!' The impudence of autoists made the London police desperate until they discovered an old ordinance which limited the speed of vehicles in city streets to three miles an hour. Every one had to be announced by a footman swinging a flag a hundred feet ahead. When customary British conscientiousness enforced this rule, the automobiles disappeared.

#### EFFECT OF REDUCED PRICES.

"While they remain expensive, the use of these vehicles is naturally confined to the few who can indulge in the luxury. But a widely felt popular demand for them, stimulated by the desire to go with little effort as fast as possible, will increase production and improve quality. Increasing sales will reduce cost, until a fair mobile may be had for the price of a good cycle. When their use becomes universal they will be more dangerous than trolleys, which are confined to their tracks. Notwithstanding innumerable laws to prevent them, casualties are of daily occurrence; it will be difficult to restrain autos from killing pedestrians, from destroying the slower vehicles, and from injuring each other when thousands race at the rate of forty miles an hour over the common highways. They should then be restricted to inclosed roads of their own, as locomotives very properly are."

#### LIFE AND DEATH.

IT is difficult to imagine an article on the tremendous problems of life and death in an English or American review, but the French are extremely fond of such articles. M. Dastre's paper in the first May number of the *Revue des Deux Mondes* is a good example of its type. He begins by denying flatly that science has thrown any real light on the mysteries of life and death, while philosophy offers us merely hypotheses,—the old ones,—thirty years, a hundred years, and and even two thousand years old. In biology,—to return to science,—there are three main systems by which it is attempted to explain the vital phenomena,—in fact, the various biologists may be divided into animists, vitalists, and unicists.

#### THE EMANCIPATION OF SCIENCE FROM "THEORY."

Of course, it must not be supposed that science has made no progress. The neo-animists of to-day have traveled some distance from Aristotle, St. Thomas, or Stahl; so, too, Darwin and Haeckel have developed the modified ideas of Descartes. In M. Dastre's opinion, the most striking change has been that theories have ceased to tyrannize over scientific research. At the beginning of the nineteenth century the science of vital phenomena had not progressed in the same manner as the other natural sciences, but remained to a large extent wrapt in the scholastic fog. Vital force was regarded as a capricious thing, which acted arbitrarily in a healthy body, and still more arbitrarily in a sick one.

#### TRUE FIELD OF PHYSIOLOGY.

Then came the revolution which separated the sphere of experimental science from that of philosophical interpretation. As M. Dastre says, Ludwig and Claude Bernard drove out of the domain of experimental science these three chimeras,—vital force, the final cause, and the caprice of living nature. Physiology found its limits in a perception that the living being is not merely an organism completely constituted,—such as a clock, for example,—but it is a piece of machinery which constructs itself and perpetuates itself, and is thus distinguished from anything of the kind in inanimate nature. The true field of physiology was thus found to be the study of those phenomena by which the organism constructs and perpetuates itself.

## THE PERIODICALS REVIEWED.

### HARPER'S MAGAZINE.

FROM *Harper's Magazine* for July we have selected Prof. Simon Newcomb's account of "What the Astronomers Are Doing," and Mr. Overton W. Price's explanation of the national government's coöperation with private forest owners, for quotation in the "Leading Articles of the Month."

A pleasant feature for bookish folks is Mr. Edmund Gosse's article on 'Elizabethan Dedications of Books.' At the close of the sixteenth century a book, or even a pamphlet, without a dedication excited suspicion that there was something disreputable in it. "The usual mode was to find some man of high social position, if possible a lord, who would accept the dedication as a gift. It has been too much taken for granted that the patron was expected, if he accepted the book, to make an immediate present of money to the author. I have come to the conclusion that, although no doubt this was sometimes done, it was not the custom in the Elizabethan age, as it became later in that of Anne."

Benjamin H. Ridgely has a delicious travel sketch in pictures and text in "Summer Life in Andalusia." Prof. George E. Woodberry, of Columbia College, contributes an essay on "Beginnings of American Literature," in which he places the first appearance of an American spirit, indigenous and of the soil, in folk-literature such as "The Song of Braddock's Men," the ballad of "Nathan Hale," and "Yankee Doodle," our first name distinctly literary being that of Philip Freneau. Vance Thompson has a capital sketch of "Falconry of To-day;" A. J. Grout describes "Some Vegetable Air-ships," and George L. Kittredge writes of "Ways of Words in English Speech."

### THE CENTURY MAGAZINE.

THE July *Century*, an unusually attractive and well-varied number, takes up as a matter of seasonable interest "A Campaign Against the Mosquito." Dr. L. O. Howard, of the Department of Agriculture, says, to show what an interest is taken in the subject of mosquito extermination throughout the country, that during the past year he has received thousands of letters, most of them inquiring about methods for relieving individual houses, neighborhoods, and communities from the pests. Several towns in New Jersey are beginning to take scientific measures, and are doing some drainage work on a large scale. A city appropriation in Baltimore is about to be made for such work, and two physicians are making a mosquito topographic survey of the suburbs of that city. New Orleans, Nashville, Rome, Ga., Talladega, Ala., Winchester and Norfolk, Va., and a number of other places in all sections of the country either have plans under consideration, or are already beginning work. Mr. H. C. Weeks follows Dr. Howard in a detailed account of the extensive operations at Oyster Bay, L. I., undertaken by the North Shore Improvement Association of Long Island. The work there consists of the employment of drainage and petroleum. In using petroleum it is not necessary to consider the depth of a stagnant pond, as the film of oil on the surface does the work. The preliminary

engagement with the mosquito pests at this place have already had pronounced and satisfactory results.

### FRANCIS WILSON ON EUGENE FIELD.

There is a very pleasant reminiscent article on Eugene Field and his humor by his warm friend, Francis Wilson, the actor. Mr. Wilson says that "Field loved all things that were beautiful. He had a wonderful tenderness toward childhood and motherhood. He detested sham and pretense. He lost no opportunity to assail these vices. His feeling for sweetness and truth is shown in many of his writings, but is best seen in his exquisitely written short stories, such as 'The First Christmas Tree.'"

### LORD SALISBURY AS A SCIENTIST.

Mr. Julian Ralph contributes a character sketch of the Marquis of Salisbury, and gives a picture of the private life of the premier. Lord Salisbury's recreations have been found in books and scientific purposes. He has been an omnivorous reader of all that is best in the old and the new literature of the times, and there has seemed to those who both shared his tastes and enjoyed his society nothing of note or moment that he has not read. "Still pleasanter to him are the hours he spends in his laboratory, which is said to be unsurpassed in completeness and modernness by any private laboratory in England. From his youth he has had a bent for this work, and in physics especially he has attained such knowledge as to be sought, for counsel and discussion, by some of the greatest minds in that field. It is even said of him that if he had not been a great statesman he would have made a greater scientist."

There is a timely article on "The Volcano Systems of the Western Hemisphere," by Robert T. Hill, a further installment of Mr. Ray Stannard Baker's valuable papers on "The Great Southwest," and a number of short stories, among them one by the late Paul Leicester Ford.

### THE COSMOPOLITAN.

IN the July *Cosmopolitan*, D. A. Willey describes a new social institution, "The Trolley Park." The street and suburban railway companies, realizing the profit arising from appealing to the pleasure of the people, have begun to establish parks not only for the cities, but for clusters of small communities on the trolley system. From the few acres of grove with some rough benches and a shed or so for protection from the weather, these pleasure grounds have been developed into resorts even more attractive than the public parks of the city. On a holiday one may see more than fifty thousand people gathered in some of the more extensive trolley parks owned by companies in Philadelphia, Detroit, Minneapolis, Baltimore, and other centers of population, listening to the band concerts, watching or taking part in ball games, boating on the lake or river, strolling along the shady walks, having a family picnic under the trees, or enjoying the summer opera. Except for the nickel, dime, or quarter which admits to the concert, rents the boat, or provides some other special amusement the park is free to all, the company obtaining its profit in the fares which it collects.

PHOTOGRAPH OF THE NEBULOSITY ABOUT NOVA PERSEI IN SEPTEMBER, 1901, BY C. W. RITCHEY; TWO-FOOT REFLECTOR, YERKES OBSERVATORY. EXPOSURE, 3 HR. 50 M.

(The concentric rings of nebulous matter are very strongly marked; it was from the measures on the sharper points to the right that the remarkable motion was discovered from this photograph. The rays of light emanating at right angles from the principal star are merely an optical effect arising from interference of rays in the reflecting telescope.)

gases within, which would then burst forth with great energy.

"It is also possible that the crust of a dark star became torn and broken simply through the natural shrinkage of the star itself, and that the imprisoned gases rushed out, and by their glow, combined with that produced by chemical union with the atmosphere of the body, created a great outburst of light.

"And finally, to these several theories may be added another explanation, equally plausible, namely, that the outburst was caused by the passage of a dark star through a cloud of cosmic material. Such clouds exist in great numbers in the sky, and it is at least possible that the friction would have been sufficient to raise the mass of cold matter to white heat, and then to change it into an incandescent vapor and possibly into the dissociated gaseous state, all in a few weeks or days."

#### THE NEW STAR AND ITS NEBULAE PHOTOGRAPHED.

A photograph of the new star, secured by Mr. G. W. Ritchey, of the Yerkes Observatory, on September 20, 1901, showed it to be surrounded by a nebulous cloud extending to a great distance from the center. A comparison of this photograph with a similar one secured six weeks later by Professor Perrine, of the Lick Observatory, showed that the nebula was in extremely rapid motion away from the central star.

"Even were the star as near as the nearest of the fixed stars, this motion would be so great as 1,640 miles a second. But measures of the parallax, by means of the micrometer and heliometer, indicate that the distance is at least sixty or seventy-five times as great as the velocity of light. It has been suggested that the central star may be surrounded by a nebulous cloud, and that the particles of which this cloud is composed become visible to us as they are successively illuminated by the light emanating outward from the central star. In other words, that we here actually see the light traveling outward with the inconceivable velocity of 186,330 miles a second. Whether this is the case or not, it seems improbable that it can be actual material

which is being ejected from the central star with this velocity."

The sudden formation of such a nebula is a phenomenon new to astronomers.

#### HOW THE GOVERNMENT AIDS PRIVATE OWNERS OF FORESTS.

IN *Harper's* for July, Mr. Overton W. Price, of the National Bureau of Forestry, has an interesting account of the work done by the United States Department of Agriculture in co-operating with the private owners of forests. There are now on hand applications for expert advice in the handling of over three million acres of private forest, the result of a circular issued in October, 1898, offering assistance to farmers, lumbermen, and others in the management of their forest lands. Mr. Price says that it is no longer necessary to argue with private

owners concerning the value of scientific forestry. The only difficulty is to find trained men to put the principles of forestry into effect. The worst error of the private owner in the unscientific treatment of the forest is his ignoring its productive capacity. Immature trees are not cared for, and the forest is not able to reproduce itself. Mr. Price explains that practical forestry is always a compromise between what should be done for the good of the forest and what is necessary to do in order that the property may yield a fair return on the capital it represents.

#### THE YOUNG GROWTH IS WORTH SAVING.

The attempt of the national government to cooperate with private owners of forests was begun in the Adirondacks in 1898. It was based on a careful preliminary study on the ground, by which the financial soundness of lumbering spruce with a view to taking a second crop in the same area, was established. In other words, it was found by measurements of the number of mature and immature spruce trees, and by a study of their habit and rate of growth, that the return from lumbering renders it profitable to protect spruce trees of less than merchantable diameter, and to favor the reproduction of the tree.

#### THE RULES OF SCIENTIFIC LUMBERING.

"It was found that the customary method of logging spruce seriously impairs the advantage of holding the logged-off area for a second crop, through its great attendant damage to small trees and young growth generally. It was, therefore, necessary to so modify this method that without encroaching too far upon present profits the productive capacity of the forest might be preserved. Rules were drawn up to govern lumbering, the main objects of which were the following:

"The leaving of a sufficient number of seed-bearing spruce in the forest to invite reproduction, and of those smaller trees which, although of merchantable size, can be harvested much more profitably when they have reached a larger diameter.

"The elimination of all unnecessary waste of merchantable timber, as in high stumps, lodged trees left in the woods, and failure to run the logs well up into the tops.

"The avoidance, wherever practicable, of damage to young growth.

"It is believed that the application of these rules by a large paper company to its own lands in Maine is the strongest argument in their favor which has yet been made. The purpose and practice of forestry on lands of private ownership in the Adirondacks are fully described in Bulletin 26 of the Bureau of Forestry,—“Practical

Forestry in the Adirondacks,” by Mr. Henry S. Graves, now director of the Yale Forest School.

#### PRACTICAL EXAMPLES FOR PRIVATE OWNERS.

"The cooperation which is now carried on between private owners and the Bureau of Forestry has been undertaken with the belief that example will prove more powerful than precept in the institution of improved methods upon private forest-lands. It is intended to provide practical examples which show that conservative lumbering not only leaves the forest in better condition than does ordinary lumbering, but that it is usually a sounder financial policy. There has been in this country a good deal of severe criticism of lumbermen and lumbermen's methods which has done the cause of forestry no good. The American lumberman will not modify his methods until he has been shown that it is profitable for him to do so.

#### THE FORM OF COÖPERATION.

"In the cooperation between the Bureau of Forestry and a private owner, the first point to be decided is whether the application of forestry will be profitable upon the forest-land in question. A preliminary examination is accordingly made by a forester, the result of which is embodied in a report to the owner. If the conditions be favorable, a working-plan is then made, should the owner desire it. This working-plan is a comprehensive and detailed scheme for the management of the forest. It forecasts the profits from lumbering and the present yield of merchantable timber. It fixes the diameter limit to which trees shall be cut, and prescribes all modifications of ordinary logging methods which are practicable and profitable in hastening the production of a second crop. It states how large this second crop will be in a given number of years, estimates the cost to the owner of obtaining it, and sums up what will be the result of conservative forest management from a business point of view. The working-plan entails careful measurements of the stand of merchantable timber, and of the number and size of immature trees. It includes a thorough study of the habits and rate of growth of the local trees, and the effect of lumbering upon the forest, and of those modifications of ordinary methods which are both silviculturally and financially advisable. Based upon this study on the ground, the working plan is a plain statement of the most profitable way in which a forest may be handled for its own good and for the good of the owner."

Owners of wood-lots and forest lands, from a few acres to thousands of acres, all over the United States, are eagerly availing themselves of this valuable aid.

## THE MEN OF THE [LONDON] "TIMES."

THE *Caxton Magazine* for May has an illustrated article on "The Men of the *Times*," by Mr. J. C. Woollan. The three chiefs of the *Times* who are dealt with are Mr. Walter, Mr. G. E. Buckle, and Mr. Moberley Bell. Mr. Buckle has been editor of the paper for no less

MR. G. E. BUCKLE.  
(Editor of the *London Times*.)

than eighteen years, having been only twenty-nine years old when called to the editorial chair in 1884. Mr. Woollan says that he was chosen chiefly because he had large mental gifts which had been highly cultivated, and had, moreover, most excellent talent for expressing himself in good English. Mr. Buckle's enthusiasms are golf and privacy, the latter being no doubt the reason why he is so little known in the general world. The other strong man behind the *Times* is Mr. Moberley Bell, who is officially described as assistant-manager, but whose position is a very different one. Mr. Bell was formerly *Times* correspondent in Egypt, having inherited that post from his father. Mr. Bell has been described as the "De Blowitz of Egypt," and he has been credited with being the original author of the British occupation. Judging from what Mr. Woollan says, the *Times* is by no means under the control of old Tories. Mr. Moberley Bell is a Liberal-Unionist, while Mr. Buckle is a member of the Reform Club, which fact is given as "a hint as to his personal politics."

## MAXIM GORKY.

MAXIM GORKY, "a new star in the firmament of Russian literature that has excited much attention not only in Russia, but also in other countries," is the subject of an article by M. von Brandt in the *Deutsche Rundschau* for May. The writer is not sure whether Gorky will turn out to be a fixed star, or will eventually dwindle down to a star of smallest magnitude after a brief period of brilliance. But the question is immaterial, since Gorky is, in any case, interesting as a product of his surroundings.

Maxim Gorky,—i.e., "the Bitter,"—was born March 14, 1868, at Nishni Novgorod, the son of a paper hanger. He lost both his parents at the

age of five; four years later he was apprenticed to a shoemaker by his grandfather, a dyer. The boy soon ran away, and for fifteen years thereafter he led a wandering life. He tried his hand at many occupations to support himself, but never staid long enough in one place to gain a foothold. However, during these years he unconsciously gathered the material he was to use later on for his stories. His education he gained through omnivorous reading, to which he was first directed by a cook on a Volga steamer, where he served as scullion. His first literary attempt was a story, "Makar Tschudra," that appeared in 1892 in a magazine at Tiflis, where he was working in a railroad shop. The success of this story determined his career.

Gorky, with his antecedents, would naturally be in sympathy with the movements of the Russian people, that now and again find expression in the student riots. Attracting the attention of the police by his last works and his intercourse with suspected persons, he was arrested this year at Nishni, but soon liberated, and is now living in the Crimea, under police surveillance, it seems. Gorky, as an exponent of the life of the Russian people, takes a place in its literature, the tendencies of which he exemplifies.

## TENDENCIES OF RUSSIAN LITERATURE.

"Russian literature in its normal development for the last fifty years, and even more on its abnormal side, is the product of the view of life of the great mass of the Russian people that has remained entirely untouched by western European ideas. The vague, dreamy longings of the inhabitant of the steppes, who has scarcely come under the influence of culture, the unconscious groping for more truth and light which has for centuries produced innumerable sects within the Russian Church, and finally the Russian peasant's love for the soil,—these have given to Russian literature its local color and its power. The outlook upon 'little Mother Volga,' the mighty river, the immense steppes, and the still more immense sea, the attempt to fathom the heart of the peasant, which is unfathomable, as everything that is not bounded by knowledge,—these have given to Russian literature that dreaminess, vagueness, and undefinableness that exerts such great charm upon the Russian himself, and is even influencing the more critical West-European. Tolstoy is in this respect the most characteristic figure of modern Russian literature."

## GORKY'S COMMUNISTIC VIEWS.

Gorky is a product of the communistic tendencies of Russian socialism and of the moral conditions of the Russian people. "Brandy plays

a large part in his stories ; but he also expresses admirably the vague longing for something higher, that seems to fill every Russian of the lower classes, the love and comprehension of the broad expanse of the steppes and the sea, for what we might call the distant, which drives the peasant from his glebe and the vagabond from the work just found, the chasm that divides the tramp from the breadwinners and the proprietors. . . . Hatred against ownership, and perhaps even more against work that produces more than the mere daily bread, is the red thread running more or less distinct through all of Gorky's work, and which gives to it its socialistic color. This is most apparent in the novel 'Foma Gordjejew.' . . . These communistic-socialistic views, though neither very intellectual nor especially new, evidently characterize the point of view that Gorky himself takes, or that he presupposes in the majority of his readers. Hence they deserve more attention than they could otherwise claim, as they also are subject to the old error that only manual labor is work, a point of view that corresponds to a low state of culture, but that would hardly obtain in a more advanced state of society."

#### A RUSSIAN REALIST.

Von Brandt sums up his impressions of Gorky as follows : "Gorky's stories display great power,—and one is often tempted to add, great beauty,—in spite of the unpleasant material, so long as he tells of what he has seen and felt himself. But when he goes into psychological questions, as in 'Foma Gordjejew,' he weakens or sinks into the mud of the French immoral novels. As long as he remains Russian he gives us at least a faithful description of the lower, or perhaps the lowest, classes of the Russian people. His figures have the advantage of being true to life. They are not appetizing ; they smell of sweat, brandy, rags, and misery, and the lack of soap and water is unpleasantly apparent ; but they are people of flesh and blood, and not pale phantoms. Hence the reading of his works is not such a trial to the nerves as that of many other products of the northern school. We are moved, and may even turn with disgust from many of his creations, but we must admit that he has gone straight to the life of the people, leading us to the depths, if not to the heights. If it had been his intention to represent to us the classes that he has drawn as being ready for liberation, we should have to designate the attempts as a failure ; on the contrary, he has placed many of the measures of the Russian Government in a clearer light. His works so far have given no proof that he is equal to the task of exerting an

educative influence on his people. His story, 'A Curious Reader,' seems to indicate that he himself has sometimes doubts as to his work and his powers. He here speaks of the bitter hatred that is continually smouldering in his soul, but also of the doubts that beset him, he and his kind being 'like torches that burn fitfully by the grace of Satan, the smoke they send out penetrating deep into the mind and heart, saturating them with the poison of disbelief in one's self.'"

#### IN PRAISE OF THE CHINESE.

A THOROUGHGOING eulogist of China is Prince Ukhtomsky. He contributes to the *Contemporary Review* an article on "The Genius of China," which is enough to make us all weep that we were not born Chinese. Prince Ukhtomsky has been in China many times, and has fallen in love with the yellow man. He believes in him down to the ground, and in this article he ventures to prophesy various things which, when they happen, will occasion disturbances in the world at large.

#### THE EXPANSION OF CHINA.

China is something so immense and potent that it is impossible to foresee to what it may grow within a few decades. It is certain that the current of modern life will drag China into its strenuous whirlpool, will stir up and stimulate the naturally good-natured giant to demand a proportionate share of power, glory, and wealth, of success and weight in the assembly of nations. Already the yellow race begins to struggle with difficult problems ; and in the twentieth century, whatever it may cost, China will acquire as natural colonies Annam, Cochin-China, with Cambodia, Siam, and Burmah, the great Malay regions, Formosa, the Philippines, Borneo, Sumatra, and Java. Whoever rules China, it will certainly in time acquire a formidable fleet, and then the struggle for existence will follow its course with pitiless logic. The Chinese have energy, sagacity, and capital. Until the year 1400, China kept a whole generation ahead of Europe. Since then she has fallen behind, perhaps some thirty years. But she is waking up. There are no signs whatever of decline or decrepitude. Unable to repel the invading foreign devils, they have made themselves indispensable to the newcomers, and managed in a certain sense to bind them hand and foot. Already being unrivaled in the field of commercial resourcefulness, the Chinese little by little crowd out the foreigners from their territory, and the time can hardly be far distant

when all the import and even the export trade will be in the hands of Chinamen, whose diligence is exemplary, and who rapidly learn and master every industry. The day must surely come when America, England, Sweden, and Germany will cease to be necessary to China, grown aware of her own boundless resources.

#### A PHILOSOPHY OF HISTORY.

Prince Ukhtomsky maintains that the Russians alone, of all foreign nations, are regarded by the Chinese as their friends. He quotes a story told by the Russian poet, Maikoff, which tells how he once asked the Kirghiz Sultan Vaikhanoff what was his philosophy of history. He answered, "God Almighty gave the sovereignty of the earth to my ancestor, Jenghis Khan. For our sins it has been taken away from his descendants and given to the White Czar. That is my philosophy of history." It is not quite clear, however, whether the White Czar means the Son of Heaven or the Russian Czar. It is possible that Prince Ukhtomsky may expect that the Russian Czar will become the ruler of China, and so acquire a double right to the title of the Son of Heaven, which included the idea of White Prince, White Czar.

#### RUSSIA AS CHINA'S SAVIOUR.

The prince says western Europe has broken a terrible breach in the great wall of China, spiritually considered :

"Who and what can save China from falling entirely under the foreign yoke? We believe Russia alone can. From Russia's example the Western peoples will learn to understand and value an active faith which gives peace not less than Buddhism with its assuagement of the rebellious will, and, at the same time, brings the gladdening dawn of man's regeneration. This is the key of our unique success, unparalleled in history in subjecting kingdom after kingdom, not merely by open hostility and military achievement, but also by the secret powers of emotional sympathy and the irresistible necessity under which we lie of finding in every intelligent creature of whatever face, of whatever race, a comrade and brother with equal rights before God and the Czar."

He dreads the possibility of Great Britain converting the yellow man into a sepoy, and he declares boldly that the chief problem of Russia in the yellow East is to guard against such possibilities.

#### CHINESE VIRTUES.

Leaving the political question of the future relations of China to the great powers, Prince

Ukhtomsky waxes eloquent in praise of the Chinese. He denies indignantly that they are indifferent to religion and believe in nothing. The veneration of departed parents and ancestors, the recognition of the existence of their forefathers as living spirits who are able to enter into communication with their descendants, takes the place of religion. They see the presence and activity of spirits in everything. There is not a kingdom in the world where learning is so highly esteemed and revered as in China. Every scrap of paper marked with hieroglyphics is honored by the Chinese. A Chinaman is ready to study with incredible industry up to any age, overcoming the greatest obstacles. The respect of the people and of the authorities to those who have shown special assiduity and intelligence is extended also to their parents for having given birth to sons so useful for their country. The Chinese administration consists of an incredibly small number of persons of at all important rank. For the whole colossal empire there are only 9,000. The representative of power temporarily appointed is to such an extent identified with the population intrusted to his charge that he has sometimes to suffer a heavy penalty for crimes committed within the region intrusted to him, and he is repeatedly fined for the misdoings of others. He is guilty before the Son of Heaven for floods, droughts, famines, fires, and other natural calamities.

#### BUDGET FOR A SMALL COLLEGE.

WHAT shall be done with the small college? is a question that has been freshly brought to mind during the commencement season just closed. Dr. D. K. Pearsons has done something toward the solution of this problem, as was shown in the character sketch published in the *REVIEW OF REVIEWS* for November, 1901, but all the small colleges of the country have not shared in his bounty, and many such are confronted by a crisis that seems to involve their very existence.

In the discussion of the place of the traditional small college in our educational system that has been in progress for several years nothing has been more noticeable than the absence of any recognized standard of equipment or expenditure for such an institution. An attempt to supply data of this character is made by Prof. Charles R. Henderson, of the University of Chicago, who, offers, in the *American Journal of Sociology* for May, a series of estimates based on his own experience in the administration of a small college, and a comparison with the experience of others similarly situated.

## FACULTY.

As the standard of "a small college with a full classical course and adequate provision for a reasonable amount of instruction in modern languages and natural science," Professor Henderson gives the following estimates:

Faculty.	Medium cost.
Psychology, philosophy, ethics—one professor.....	\$2,500
History and sociology—one professor.....	1,800
Economics and politics—one professor.....	1,800
Greek—one professor.....	1,800
Greek—two assistants at \$900 each.....	1,800
Latin—one professor.....	1,800
Latin—two assistants at \$900 each.....	1,800
English—one professor.....	1,800
English—two assistants at \$900 each.....	1,800
French—one instructor.....	1,000
German—one instructor.....	1,000
Mathematics, chemistry, and physics—one professor.	1,800
Mathematics, chemistry, and physics—two assistants at \$900 each.....	1,800
Biology, zoölogy, botany—two instructors.....	2,000
Music—one instructor.....	1,000
Drawing—one instructor.....	900
Pedagogics must now be provided for—one professor.	1,800
Elocution—one instructor.....	1,000
Physical culture—one instructor.....	800
	<b>\$31,000</b>

These estimates call for a faculty of eight professors and sixteen instructors or assistants, twenty-four teachers in all. It is assumed that not more than twenty-five students shall be taught in one class. A smaller number of teachers, it is believed, cannot do the work thoroughly, and lower salaries would probably result in the loss of the best teachers.

## EQUIPMENT.

Professor Henderson estimates the cost of equipping a college with apparatus for instruction in the elements of chemistry, physics, and the biological sciences as follows:

Chemical laboratory.....	\$5,000
Physical laboratory.....	5,000
Biology, including botany and zoölogy.....	\$5,000 to 9,000
A good library, selected and purchased (not a collection of patent-office reports, etc.), at least.....	40,000
The annual additions should be at least.....	1,000

These estimates do not include cost of buildings.

The annual budget of such an institution would be approximately as follows:

Cost of instruction.....	\$31,000
Cost of library.....	1,000
Cost of repairs and improvements.....	2,000
Cost of additions to apparatus.....	1,000
Cost of care of buildings and grounds.....	1,000
Cost of insurance.....	500
Cost of financial administration.....	1,000
<b>Total annual disbursements.....</b>	<b>\$37,500</b>

## INCOME.

endowment, \$800,000, at 4 per cent. ....	\$32,000
From tuition fees of 300 students, at \$50 per year.....	10,000
From other fees, 300 students at \$5 per year. ....	1,000
<b>Total annual income.....</b>	<b>\$43,000</b>

This would leave a deficit of \$14,500 to be made up by annual gifts until the endowment fund can be very materially increased. As a matter of fact, scores of institutions having inferior resources to those outlined above are now conferring college degrees in this country, but the tenor of Professor Henderson's article goes to show that they do not and cannot meet modern requirements.

## A CENTURY'S LOSS IN GAMBLING.

"**M**ONEY Lost by Gambling" is the title of a paper by Mr. W. Greenwood in the *Sunday Strand*. It resumes the tragedy of the turf as enacted in the lives of plungers like the notorious Marquis of Hastings, who lost the weight of two race horses in gold in a single race, but builds chiefly on the estimate given in the following paragraph:

"It is, for obvious reasons, impossible to arrive at the exact amount of money squandered in betting every year; but not long before his death, it was stated on the authority of Mr. Mulhall, the most famous of latter-day statisticians, that during the last hundred years no less a sum than £3,000,000,000 (\$15,000,000,000) had been won and lost on the turf and at the card-table; and there are many well-qualified judges who would say that this is rather an underestimate than an exaggeration."

This total is estimated to equal in weight 66,000 race horses. It would, if portioned out among the British army in South Africa, give each soldier a load of 2 cwt. of gold. It would require ten strong locomotives to pull it. "A century's betting money would form a rectangular column of sovereigns ten feet square, and more than twice as high as St. Paul's Cathedral." Invested, the sum would have yielded £90,000,000 (\$450,000,000) a year. The calculations and illustrations are ingenious and suggestive.

## THE DEADLY AUTOMOBILE.

**R**ECENT fatal accidents,—if such they may be termed,—resulting from the speeding of automobiles in the vicinity of New York City, have drawn public attention to this new peril, and may serve to crystallize public sentiment into a demand for the more rigid enforcement of existing laws, if not for the enactment of new measures that will more effectually safeguard the lives of pedestrians and others who venture on the public highways.

## DANGERS OF UNRESTRICTED AUTO-DRIVING.

Some of the dangers that follow in the wake of the recklessly driven "autos" on many city

streets and suburban roads are hinted at in an article on "Vexations of City Pedestrians," contributed by Mr. Louis Windmüller to the spring number of *Municipal Affairs*:

"Ordinances which restrict their speed to eight miles an hour in cities are seldom heeded. The most flagrant violations rarely are punished with adequate severity. Gliding noiselessly and swiftly over smooth pavements, these vehicles are apt to run down the unfortunate who may cross their paths. In turning corners they seldom reduce speed to the rate ordained by law. Frequently they collide before they can signal their approach. The cyclist on such occasions is apt to suffer with the pedestrian, and consequently is more careful than the chauffeur, who relies on the superior strength of his vehicle. Of horseless carriages driven at reckless speed, the greater number circulate in suburbs of French cities. The driver of one who had made a run of some hundred kilometers an hour in a race near Paris, when recently called upon to explain some accidents laid to his charge, could remember the jolting of his wheels, 'but had no time to stop for investigation!' The impudence of autoists made the London police desperate until they discovered an old ordinance which limited the speed of vehicles in city streets to three miles an hour. Every one had to be announced by a footman swinging a flag a hundred feet ahead. When customary British conscientiousness enforced this rule, the automobiles disappeared.

#### EFFECT OF REDUCED PRICES.

"While they remain expensive, the use of these vehicles is naturally confined to the few who can indulge in the luxury. But a widely felt popular demand for them, stimulated by the desire to go with little effort as fast as possible, will increase production and improve quality. Increasing sales will reduce cost, until a fair mobile may be had for the price of a good cycle. When their use becomes universal they will be more dangerous than trolleys, which are confined to their tracks. Notwithstanding innumerable laws to prevent them, casualties are of daily occurrence; it will be difficult to restrain autos from killing pedestrians, from destroying the slower vehicles, and from injuring each other when thousands race at the rate of forty miles an hour over the common highways. They should then be restricted to inclosed roads of their own, as locomotives very properly are."

#### LIFE AND DEATH.

IT is difficult to imagine an article on the tremendous problems of life and death in an English or American review, but the French are extremely fond of such articles. M. Dastre's paper in the first May number of the *Revue des Deux Mondes* is a good example of its type. He begins by denying flatly that science has thrown any real light on the mysteries of life and death, while philosophy offers us merely hypotheses,—the old ones,—thirty years, a hundred years, and and even two thousand years old. In biology,—to return to science,—there are three main systems by which it is attempted to explain the vital phenomena,—in fact, the various biologists may be divided into animists, vitalists, and unicists.

#### THE EMANCIPATION OF SCIENCE FROM "THEORY."

Of course, it must not be supposed that science has made no progress. The neo-animists of today have traveled some distance from Aristotle, St. Thomas, or Stahl; so, too, Darwin and Haeckel have developed the modified ideas of Descartes. In M. Dastre's opinion, the most striking change has been that theories have ceased to tyrannize over scientific research. At the beginning of the nineteenth century the science of vital phenomena had not progressed in the same manner as the other natural sciences, but remained to a large extent wrapt in the scholastic fog. Vital force was regarded as a capricious thing, which acted arbitrarily in a healthy body, and still more arbitrarily in a sick one.

#### TRUE FIELD OF PHYSIOLOGY.

Then came the revolution which separated the sphere of experimental science from that of philosophical interpretation. As M. Dastre says, Ludwig and Claude Bernard drove out of the domain of experimental science these three chimeras,—vital force, the final cause, and the caprice of living nature. Physiology found its limits in a perception that the living being is not merely an organism completely constituted,—such as a clock, for example,—but it is a piece of machinery which constructs itself and perpetuates itself, and is thus distinguished from anything of the kind in inanimate nature. The true field of physiology was thus found to be the study of those phenomena by which the organism constructs and perpetuates itself.

## THE PERIODICALS REVIEWED.

### HARPER'S MAGAZINE.

FROM *Harper's Magazine* for July we have selected Prof. Simon Newcomb's account of "What the nomers Are Doing," and Mr. Overton W. Price's notion of the national government's coöperation private forest owners, for quotation in the "Lead-articles of the Month."

Pleasant feature for bookish folks is Mr. Edmund's article on 'Elizabethan Dedications of Books,' a close of the sixteenth century a book, or even a hlet, without a dedication excited suspicion that was something disreputable in it. "The usual was to find some man of high social position, if a lord, who would accept the dedication as a patron was expected, if he accepted the book, to an immediate present of money to the author. I come to the conclusion that, although no doubt as sometimes done, it was not the custom in the sixteenth age, as it became later in that of Anne."

Jamin H. Ridgely has a delicious travel sketch in verse and text in "Summer Life in Andalusia." George E. Woodberry, of Columbia College, contributes an essay on "Beginnings of American Literature in which he places the first appearance of an American spirit, indigenous and of the soil, in folk-lore such as "The Song of Braddock's Men," "Dad of "Nathan Hale," and "Yankee Doodle," the first name distinctly literary being that of Philip Van Vance Thompson has a capital sketch of "Sonny of To-day;" A. J. Grout describes "Some Able Air-ships," and George L. Kittredge writes "Days of Words in English Speech."

### THE CENTURY MAGAZINE.

THE July *Century*, an unusually attractive and well-varied number, takes up as a matter of special interest "A Campaign Against the Mosquito."

O. Howard, of the Department of Agriculture, shows what an interest is taken in the subject of mosquito extermination throughout the country, that in the past year he has received thousands of letters from them inquiring about methods for relieving individual houses, neighborhoods, and communities the pests. Several towns in New Jersey are being to take scientific measures, and are doing some large work on a large scale. A city appropriation of time is about to be made for such work, and physicians are making a mosquito topographic survey of the suburbs of that city. New Orleans, Nashville, Ga., Talladega, Ala., Winchester and Norfolk, and a number of other places in all sections of the country either have plans under consideration, already beginning work. Mr. H. C. Weeks follows Mr. Howard in a detailed account of the extensive operations at Oyster Bay, L. I., undertaken by the Shore Improvement Association of Long Island. Work there consists of the employment of drainage ditches. In using petroleum it is not necessary to consider the depth of a stagnant pond, as the film of oil on the surface does the work. The preliminary

engagement with the mosquito pests at this place have already had pronounced and satisfactory results.

### FRANCIS WILSON ON EUGENE FIELD.

There is a very pleasant reminiscent article on Eugene Field and his humor by his warm friend, Francis Wilson, the actor. Mr. Wilson says that "Field loved all things that were beautiful. He had a wonderful tenderness toward childhood and motherhood. He detested sham and pretense. He lost no opportunity to assail these vices. His feeling for sweetness and truth is shown in many of his writings, but is best seen in his exquisitely written short stories, such as 'The First Christmas Tree.'"

### LORD SALISBURY AS A SCIENTIST.

Mr. Julian Ralph contributes a character sketch of the Marquis of Salisbury, and gives a picture of the private life of the premier. Lord Salisbury's recreations have been found in books and scientific purposes. He has been an omnivorous reader of all that is best in the old and the new literature of the times, and there has seemed to those who both shared his tastes and enjoyed his society nothing of note or moment that he has not read. "Still pleasanter to him are the hours he spends in his laboratory, which is said to be unsurpassed in completeness and modernness by any private laboratory in England. From his youth he has had a bent for this work, and in physics especially he has attained such knowledge as to be sought, for counsel and discussion, by some of the greatest minds in that field. It is even said of him that if he had not been a great statesman he would have made a greater scientist."

There is a timely article on "The Volcano Systems of the Western Hemisphere," by Robert T. Hill, a further installment of Mr. Ray Stannard Baker's valuable papers on "The Great Southwest," and a number of short stories, among them one by the late Paul Leicester Ford.

### THE COSMOPOLITAN.

IN the July *Cosmopolitan*, D. A. Willey describes a new social institution, "The Trolley Park." The street and suburban railway companies, realizing the profit arising from appealing to the pleasure of the people, have begun to establish parks not only for the cities, but for clusters of small communities on the trolley system. From the few acres of grove with some rough benches and a shed or so for protection from the weather, these pleasure grounds have been developed into resorts even more attractive than the public parks of the city. On a holiday one may see more than fifty thousand people gathered in some of the more extensive trolley parks owned by companies in Philadelphia, Detroit, Minneapolis, Baltimore, and other centers of population, listening to the band concerts, watching or taking part in ball games, boating on the lake or river, strolling along the shady walks, having a family picnic under the trees, or enjoying the summer opera. Except for the nickel, dime, or quarter which admits to the concert, rents the boat, or provides some other special amusement the park is free to all, the company obtaining its profit in the fares which it collects.

The *Cosmopolitan* continues its series of brief character sketches of American "Captains of Industry" with articles on Charles M. Schwab, D. O. Mills, Charles Frohman, Andrew Carnegie, and John A. McCall.

#### MR. SCHWAB AS A SOCIALIST.

Mr. Samuel E. Moffett, writing on Mr. Schwab, thinks that the president of the United States Steel Corporation represents the highest development of the salaried employee, and that the real value of his career is in the light it throws upon the possibilities open to those vast wage-earning masses of which Mr. Schwab has chosen to remain a member. He calls the president of the Steel Trust a socialist in disguise, because of his theory of managing labor by making it a partner in the business that employs it. "A hard overseer," says Mr. Moffett, "may make his men afraid to shirk—Mr. Schwab has learned the nobler and more profitable art of encouraging every man to do his best."

#### INSURANCE AND POLITICS.

Mr. Charles S. Gleed, in his article on Colonel McCall, the president of the New York Life Insurance Company, calls attention to the connections of the insurance business with politics, both State and national. "To how many would it occur that a statute in Kansas governing railway cattle-guards had anything to do with the value of a policy in a New York insurance company held in Maine? But the connection is direct. If the new law costs a Kansas railroad a good deal of money, and if the insurance company holds the securities of that railroad, the value of the policy held in Maine is more or less affected. The enactment of an insurance-commissioner law in California or Minnesota or Texas has a very direct effect upon the policies of the companies doing business in that State. If the effect of legislation in Washington is to depreciate the value of government bonds, then every insurance company is harmed by such legislation." Such considerations suggest sufficiently why great insurance companies find it absolutely necessary to have a man of broad understanding and the firstability at its head.

#### THE GREAT KRUPP WORKS OF GERMANY.

One of the departments tells of the magnitude of the great Krupp gun factories of Germany: "The present head of the great Krupp works represents the third generation of this family of gun-founders. The original Krupp was named Friedrich. His son Alfred, who died in 1887, first gave world-wide fame to the Krupp establishment. Alfred's son, Friedrich Alfred, is now the director and owner of the vast enterprise, whose principal seats are in Essen and Kiel. A few figures will give an idea of the magnitude of these establishments, where practical science achieves some of its greatest results. The Krupp works altogether consume more than five thousand tons of coal per day, and employ more than forty-six thousand men, of whom not far short of four thousand are engineers, superintendents, accountants, clerks, etc. At Essen alone, where the great gun shops are located, between six and seven hundred million cubic feet of gas are burned annually, enough to supply all the needs of a city of four hundred thousand inhabitants. The amount of water used is no less surprising—between five and six hundred million cubic feet in a year, which is also on the scale of a great city's consumption."

#### McCLURE'S MAGAZINE.

FROM the July *McClure's* we have selected Dr. Henry C. Rowland's account of "Fighting Life in the Philippines" for quotation among the "Leading Articles of the Month." The magazine begins with an exact recital of "The Oversea Experiments of Santos Dumont." In his last winter's flights over the Mediterranean the balloonist was occupied with experiments very different from those which took him around the Eiffel Tower in Paris. There the goal was to win a prize by accomplishing a special task. In the Mediterranean he was experimenting scientifically for his own information. Leading aeronautists think that Santos Dumont's Mediterranean experiments, in spite of his final catastrophe, are as important as any that have been made. Mr. Heilig, the author of this article in *McClure's*, describes a novel feature of the Mediterranean experiments in the maritime guide-rope,—a long thick rope dangling from the air-ship, with eight or ten feet of its still thicker extremity dragging in the water. The very slight dragging resistance through the water does not sensibly retard the motion of the air machine, and according to its greater or less immersion the dragging rope ballasts or unballasts the airship. The great and essential virtue of this new form of ballasting a balloon is that the effect is produced without loss of ballast. Santos Dumont is now in possession of his seventh great balloon, the first one of his machines which is designed to carry an assistant with the owner, and there is a job open for an aspiring engineer. Mr. Heilig calls attention to the fact that in Europe, Santos Dumont is the only navigator of the air who actually navigates.

Capt. A. T. Mahan gives an estimate of the late Admiral Sampson's professional service and character in "Sampson's Naval Career." Captain Mahan reviews the services to the nation of Admiral Sampson, and especially those in the Santiago campaign, and has frequently to call attention to Sampson's really marvelously calm and equable temperament, which made responsibilities of the heaviest sort sit on him easily. "Disregardful of all but the necessity of success, he was heedless of personal danger and daring in professional risk. The mastery which the service had over his interest and affections, united to entire self-mastery in temper and under responsibility, assured his eminence as an officer, which history will unquestionably recognize and affirm." There is a further installment of Miss Stone's experiences among the brigands, dealing with Mrs. Tsilka and her little baby; several first-class stories appear in this number, with further chapters of Booth Tarkington's serial.

#### MUNSEY'S MAGAZINE.

GEN. O. O. HOWARD writes in the July *Munsey's* of "The Folk of the Cumberland Gap," and what the Lincoln Memorial University is doing for the people of the Tennessee, Kentucky, and Virginia mountains in this neglected corner of the United States. Within a radius of 50 miles from the university there is a population of more than 230,000 people, with no well-equipped school. The Lincoln University has admitted as high as 368 in one year. The students are given an academic education, and many of them are also given work in typesetting, carpentering, gardening, and farming. The university has sent more than twenty teachers into

neighboring districts. The students pay their way entirely at the university, but some of them pay it in money, some in work, and some part in work and part in money. The board averages only two dollars a week for the students, and General Howard says that a scholarship of \$100 will carry a student through one year. He thinks it one of the greatest opportunities, if not the greatest, in the country for the effective use of half a million dollars in furthering education where it is most needed and will have the best use made of it.

Mr. Frank S. Arnett, in an article on "American Country Clubs," shows how they had their origin in Boston, and how they have become an important element in the social life of America, this country being the only one having such institutions. Mr. Arnett thinks the country club was originally a protest against the old-time summer hotel, "probably the most ghastly aid to the killing of time ever devised."

Katherine Hoffman discusses some "Memorials of Ruskin," chiefly the medallion in Westminster Abbey, the monument on Friar's Crag, and the tomb at Coniston; John Brent describes "The World's Bathing Places," such as the Belgian Ostend, the English Brighton and Scarborough, our own Atlantic City, and the Dutch Zandvoort; Douglas Story writes on "The Art of the Needle Point," the fascinating form of artistic expression of which Dürer was the first, and Rembrandt the greatest master, and of its modern renaissance in Rajon, Flameng, Evert van Muyden, and Henner; there is a Martinique article by F. A. Ober under the title, "A Ruined American Eden," and an interesting essay on "Railroad Superstitions," by Herbert E. Hamblen. With the locomotive engineer Friday is a bad day, as with others, but it is number nine that is fatal, and not thirteen.

#### COUNTRY LIFE IN AMERICA.

THE July *Country Life*, in its series of articles on "The Making of a Country Home," treats this month various architectural details, especially the porch, or doorway. Mr. Buckham emphasizes the importance, architecturally, of the entrance to the home, and says it should express both refinement and hospitality. "It should smile, like the host, yet not too blandly nor too consciously. If it is too severe or too sumptuous, it vitiates, to a degree, the whole exterior of which it is the focus. It is unfortunate that in so many otherwise beautiful houses the doorway is overshadowed by the great piazza or belittled by the portecochère."

Mr. John Burns makes a "Plea for the Pony," as a really useful member of society. He calls attention to the effective family use of ponies in England, where large horses are more valuable proportionately than in this country. "People in moderate circumstances dwelling in the country, clergymen, small farmers, physicians, and others who cannot afford to maintain a regular stable, would indeed be at a loss without the familiar pony, which does twice as much work as a large horse could do, on half as much food and care."

Mr. James Watson has an authoritative article on the beagle in America—apropos of the revival of interest in these animals. A beautifully illustrated discussion of "The Japanese Garden in America" will make every suburbanite want to have one of his own. The most elaborate feature of the number is a sumptuously illustrated description of the beautiful Sloane estate at Lenox, in the Berkshire Hills.

#### THE NEW ENGLAND MAGAZINE.

IN the *New England Magazine* for July, Mr. G. F. Mellen writes on "Thomas Jefferson and Higher Education," sketching the latter's broad influence on the development of American educational institutions. Mr. Mellen considers that Jefferson, more than any other American, Franklin not excepted, interested foreign scholarship in America and brought foreign educators to this country. Attention is drawn to the fact that all through the building up of Albemarle College and the University of Virginia, Jefferson kept in view the same end—a real university for Virginia, manned, in the main, by European specialists.

Under the title "Whale Oil and Spermaceti," Mary E. Starbuck writes of Nantucket and its vanished industry of whaling. The decline of whaling which swept away Nantucket's wealth and population was due chiefly to two causes,—the increasing rarity of the whale supply, and the introduction of petroleum.

In "The Stars and Stripes—A Boston Idea," George J. Varney tells how "Old Glory" came to be devised. In 1775 Congress appointed a special committee to confer with General Washington, and to devise a flag for the army. The committee consisted of Dr. Benjamin Franklin of Pennsylvania, Col. Thomas Lynch of Carolina, and Hon. Benjamin Harrison of Virginia. The committee were the guests of a lady at Cambridge, Mass., who has left a diary telling of the choice of the flag design. An old college professor was staying in the house, and he and the hostess were invited to furnish the motive and composition of the flag. Their suggestion of a design consisted of alternate red and white stripes, thirteen in number, for the field, with the union jack in the upper flag corner. The model was received and adopted. It was later, in June, 1776, that General Washington, together with Col. George Ross and Hon. Robert Morris, brought to Mrs. Ross the rough design of a flag with thirteen red and white stripes, and bearing a union with thirteen stars.

#### OUTING.

AMONG the many pleasant summer and vacation subjects presented in the July *Outing* there is a description of a new field for sportsmen by Alger M. Fredericks, who tells of the country lying west of Lake Temiskaming, the boundary between the provinces of Quebec and Ontario. In this part of northern Ontario, Mr. Fredericks says, the big game is just as plentiful and the country is just as wild as in the province of Labrador, where there is a population of only one man to every thirty-five square miles.

#### ADVICE TO CAMPING PARTIES.

Mr. Edwyn Sandys gives complete advice to vacation venturers into the wilderness, in "A Chat About Camping," advocating, instead of the regulation tent, a big sheet of waterproof stuff with an eyelet and a long tie-string in each corner, with a thirty-foot clothes-line, to use instead of a pole. The most important part of this coaching for camping parties he considers an injunction to put out the fire beyond any possibility of life, "so that you can go away satisfied that no criminal carelessness on your part will add a scar to the face of North America."

Miss A. C. Laut, in her serial, "The Story of the Trapper," considers this month "The Buffalo Runners." Mr. Alexander Kidd tells in detail how A. F.

Duffey recently cut down the world's record for a hundred-yard sprint to nine and three-fifths seconds, and J. P. Thompson furnishes "A Short Cut to Swimming," with a suggestion of the easiest and most natural method of learning the art.

#### LIPPINCOTT'S.

"LIPPINCOTT'S" for July contains an account of the operation of laying a modern cable, by Percie W. Hart. At present there are forty-two fully equipped vessels employed solely in laying and caring for the telegraphic cables of the world, which aggregate 180,000 nautical miles. Deep sea cables weigh about two tons to the mile, while the inshore variety weighs about fourteen tons to the mile, so that it requires a stout vessel to carry any considerable length of cable. The cable is coiled in big iron tanks thirty or forty feet in diameter in the cargo hold of the vessel. "There seems to be no logical reason why cables cannot be laid across any section of the oceans of the world, no matter how great the depth. Some portions of the Atlantic cables are over three miles below the surface, and this is not necessarily the extreme depth, for the cable may, and probably does, pass from the top of one submarine hill to another without drooping materially into the deep valleys between. The greatest depth of the sea is 40,236 feet, or seven and three-fifth miles, found in the South Atlantic about midway between the island of Tristan d'Acunha and the mouth of the Rio de la Plata."

This midsummer number of *Lippincott's* is chiefly occupied with fiction and verse, the complete novelette of the month being Mabel N. Thurston's "On the Road to Arcady."

#### FRANK LESLIE'S MONTHLY.

"FRANK LESLIE'S" for July is enterprising in printing an illustrated article on the Martinique disaster containing the actual observations of the explorer, C. E. Borchgrevink, who was one of the party that visited the scene of the cataclysm. He says that it is not at all probable the recent eruptions have terminated the present geological events in the West Indies. "There evidently still exists a very strong pressure below the earth-crust in this locality. The escape of steam from the craters will momentarily lighten the pressure, but when the molten conglomerate stiffens a fresh outbreak is likely to take place wherever the facilities for breaking are the best." This writer thinks that electricity plays a much larger part in the eruptions than has hitherto been supposed, and that the study of volcanic problems will have to be pursued along very different lines from those which have hitherto been followed by scientists.

In "Drying Up a Sea," Mr. R. Beckles Wilson gives a very good account of the enormous undertaking of the Dutch in reclaiming the greater part of the Zuyder Zee, a sea covering no less than 1,460 square miles. The lands to be reclaimed should support from 20,000 to 50,000 persons in comfort and plenty, whereas at present 8,500 fishermen only get a precarious living from the waters. The engineering aspects of this huge work were presented in the May number of the REVIEW OF REVIEWS.

*Frank Leslie's* opens with an article on "Crowning a British King," by His Grace, the Duke of Argyll, fol-

lowed by a description of the coronation ceremony proper by Curtis Brown; there is printed in this number the personal narrative of Chief Officer E. S. Scott, of the *Roraima*, describing the destruction of that vessel in the harbor of St. Pierre, on May 8, and a discussion of the representation of the Southern States in the House and the Electoral College, by the Hon. E. D. Crumpacker, author of the plan to cut down the Southern delegation to Congress.

#### THE NATIONAL MAGAZINE.

DR. PETER MACQUEEN advocates in the July *National Magazine* "An Island Republic for the Filipinos." He thinks Dean Worcester gave the wrong impression of the situation in merely making the statement that there are about ninety different tribes in the islands. Dr. MacQueen says eighty-seven of these tribes do not number a half a million, whereas the three great Malay divisions number nearly seven millions. This writer suggests the formation of three co-operate states under a central republican government. The Tagalos, the Visayans, and the Morros each to have a state, and the national capital to be located at Manila. Douglas Malloch describes the unveiling of "The First McKinley Statue," at Muskegon, Mich. The statue was presented to the city by the philanthropist, Charles H. Hackley. It was the work of the sculptor Niehaus, and was unveiled last Memorial Day in the presence of 50,000 people. The commission for the statue was given within a few weeks after the President was shot.

Harriet O. Clendenin describes "An Army Woman's Voyage to Manila," the journey being taken by way of the Suez Canal. There is a sketch of Gen. E. S. Bragg, recently appointed to be the first consul-general of the United States at Havana, another of Secretary Cortel-you, and other timely features.

#### THE WORLD'S WORK.

IN the July *World's Work* Commander Richard Wainwright describes "The New Naval Academy" and the imposing buildings that will cost \$8,000,000. Commander Wainwright, who is superintendent of the academy, says that the plans designed by Mr. Flagg will produce not only commodious buildings well suited to the needs of the academy, but also a splendid architectural masterpiece well worthy of the country. The buildings the Naval Academy has had to get along with have always been behind the needs of the institution.

#### SALARIES OF CLERGYMEN.

The Rev. David M. Steele, writing on "The Ministry as a Profession," says that no clergyman can become rich. According to him, the largest incomes ever had by any clergymen were those of the late Drs. Brown, Hall, and Babcock, of New York, each of whom received nearly \$30,000 a year; but in the entire Episcopalian and Presbyterian denomination Dr. Steele says there are not ten men to-day in the United States with salaries of \$10,000 a year, while there are men at work with salaries of not \$1,000 in ten years. He gives the average salary of the average clergyman of the average denomination in the average community as about \$900. Dr. Steele calls attention to two dangers to which a clergyman is subject, and to which other professions are not subject. The first is that of being a failure, the second is that of

being overtaken in a fault which would not be a fault with other people.

#### TWO CANNIBAL COLLEGE STUDENTS.

Mr. Samuel P. Verner, of Stillman Institute, Alabama, has an account of a very interesting educational experiment with two cannibal boys from Central Africa who are now in an American school. One is the son of a chief, the other the son of a fisherman. The country from which they came is the most remote from outside influence in Africa, two thousand miles from either coast, and just south of the equator. The tribe are such confirmed cannibals that it has been repeatedly asserted that they eat their own dead, and have bone-yards instead of cemeteries. Mr. Verner carried the boys to Alabama, and is educating them at the Stillman Institute. He proposes to carry them even to the university, and to some special education if their progress and promise demand it. The progress so far has been extraordinary. They can read and write, and know elementary geography and arithmetic, write letters, have professed Christianity, and have decided and decidedly good character. They are faithful workmen on the farm, and can use the ordinary mechanical tools fairly well. One is leading his class with an average of 93, and the other is not far behind. Mr. Verner hopes ultimately to secure a concession of land for them from King Leopold of Belgium, that they may return to elevate their people.

Dr. W. H. Tolman, in "Lifting up the Liquor Saloon," discusses the various substitutes for the saloons that have been tried, such as the People's Refreshment House Association, in England; Donald Murray tells "How Cables Unite the World," and describes the growth of the vast system of submarine telegraphy and the recent achievements in swift automatic transmission; Waldon Fawcett gives a picture of "The President's Business Office;" H. M. Stephens writes on "Some Living American Historians;" C. H. Matson tells of the mammoth Sherman farm in Kansas, which has a fence line more than 100 miles long, and includes 52 square miles of wheat, corn, and pasturage; and there are articles on "The Northwest Boundary," the coal strike, and "The Revival of Skilled Handwork."

#### THE ATLANTIC MONTHLY.

IN the *Atlantic Monthly* for July appears a careful *resumé* of legislation in Porto Rico in the two years of American occupancy, by W. F. Willoughby. We have quoted extensively from this in the department of "Leading Articles of the Month." The editor of the *Atlantic* has the courage in his essay on "Keeping the Fourth of July" to confess a boyish fondness for the old-fashioned reckless and noisy day. However grandiloquent sound the Websterian phrases of half a century ago, and however superior we think we have grown to spread-eagleism, barbecues, and buncombe, to the early firecracker and the long-awaited sky-rocket, the *Atlantic's* editor is willing to be awakened at an unseemly hour if only for the memory of dewy-wet dawns of long ago, and the imminent deadly breech-rusty cannon under the windows of frascible old gentlemen, of real battle-flags waving, and perspiring bands pounding on "The Star-Spangled Banner," and impassioned orators who twisted the British lion's tail until it looked like a corkscrew.

An important literary contribution to the *Atlantic*

is the publishing of extracts from the manuscript diaries of Ralph Waldo Emerson, appearing in this number with the consent of the philosopher's children. They describe, with utter and engaging frankness, his walks, talks, and excursions with his younger neighbor and friend, the late William Ellery Channing. Mr. Higginson well says of these extracts, in a prefatory note, "With all our previous knowledge of Emerson, it may yet be truly said that he has nowhere been revealed in so sweet and lovable a light, combined with an attitude so open and independent, as in these detached fragments."

In the course of a very pleasant article on the sport of sailing, Mr. W. J. Henderson maintains that we owe a big debt to the leading yacht clubs of the country, as they are the propagators of the true nautical spirit. The small-boat sailor but follows in the wake of the large yacht. Even the professional fishermen sailors are thoroughly versed in the doings of the cup defenders, and learn all that is to be learned from international yacht races. The yacht-club membership is a small percentage of the myriad of sailors these associations give to the country. Dallas L. Sharp presents a really delightful nature study in his symphonic description of "The Marsh;" James A. Le Roy discusses "Race Prejudice in the Philippines," and there is an essay by Edward Dowden on Walter Pater.

#### THE NORTH AMERICAN REVIEW.

THE June number of the *North American Review* opens with an article by M. Santos Dumont on "Air-Ships and Flying Machines." The young Brazilian aeronaut makes the frank admission, at the close of his article, that "it is shorter and more convenient to pen a system of aerial navigation on paper than to set it in motion and make it perform its functions." Indeed, M. Santos Dumont seems quite aware of the fact that the American people are more interested in the coming aerial competition at St. Louis and elsewhere than they can possibly be in any series of magazine articles theorizing on the subject. Nevertheless, he announces his resolve to write a series of such articles; and, if it proves impossible to set forth the principles of aeronautics within such narrow limits, M. Santos Dumont promises to give to the world, in different languages, the voluminous manuscript in which he has summed up for his own instruction, in the form of a treatise, the scientific principles and historic facts of aerial navigation from the more remote times to the present day.

#### RAILROAD DISCRIMINATION.

In an article entitled, "How to Curb the Trusts," Mr. Henry Michelsen makes an argument for the nationalization of railroads. He admits that the present state of affairs in our American transportation system has been brought about in a perfectly legitimate manner, and that the establishment of the business of the nation upon its present large scale is due to the genius and administrative ability of the men who handle the railroads. The rates of freight and passenger traffic, he says, are low compared with those exacted abroad, while the service is being constantly improved. What the public complains of, he says, is "not that the transportation lines are willfully and arbitrarily exacting, by means of excessive rates, undue advantages for themselves, but that they discriminate in favor of trusts and

corporations, thus destroying the chances of individual citizens, retarding the establishment of new enterprises, and placing the control of the markets in the keeping of the favored few, who, in turn, coerce the railroads into a continuance of these discriminations." Mr. Michelsen proposes that in the nationalization of the railroads the Government should not pay more than is warranted by the intrinsic value of the property, and the transfer would have to be effected with proper safeguards, similar to those under which several European governments have proceeded. It has been objected that one consequence of the purchase of the lines by the Government would be the great accumulation of wealth in a few hands, but to this objection Mr. Michelsen replies that the present system has a tendency to bring about precisely this result; and that, as the purchase of the railroads would probably be effected by means of bonds bearing a very low rate of interest,—redeemable after a reasonable length of time at the option of the Government,—the result would be that these securities would be employed as the bases for other investments for which the undeveloped resources of our country offer an unlimited field. The effect of the creation of a large office-holding class, dependent on the party in power, is not deemed by Mr. Michelsen to be ominous to the general welfare, since such a class already exists in the railway service, numerous attempts having been made at different times by the railway officials to control the vote of their employees, always without success.

#### AMERICA'S CONTROL OF ENGLAND'S FOOD SUPPLY.

Mr. J. D. Whelpley makes some startling assertions regarding the extent to which the food supply of Great Britain is in the control of the United States. He says: "If the United States were suddenly to stop all present regular exportations of meat and breadstuffs to the United Kingdom, the first effect would be an enormous rise in prices throughout Europe, and it would be but a few weeks before the English people would be threatened by dire famine, with no possible relief in sight so long as commercial relations with the United States were suspended." Mr. Whelpley then proceeds to offer a mathematical demonstration of the soundness of his assertions. Of the total importation of food staples by the United Kingdom, amounting to about \$800,000,000 a year, the United States furnishes about \$540,000,000, or 60 per cent. For meat alone the United States receives \$160,000,000, and of the trade in breadstuffs about \$150,000,000, or over 50 per cent. of the total.

#### THE TOBACCO WAR IN GREAT BRITAIN.

Mr. Lincoln Springfield gives an interesting account of the bitter fight between the American and British tobacco trusts to control the trade of Great Britain. The Imperial Tobacco Company, Limited, has been started with a capital of £15,000,000 (\$75,000,000) for the purposes of controlling the trade of Great Britain and Ireland. The president of the American Tobacco Company declared his intention of obtaining control of the entire tobacco trade of the United Kingdom. That declaration led to the formation of the Imperial Company, composed of thirteen of the best-known tobacco firms of England. The attempt of the American trust to capture the trade by cutting prices has thus far proved unsuccessful. Almost equally futile, it would appear, has been the extravagant expenditure for advertising purposes. The Imperial Company has estab-

lished branches for the purchase of tobacco at Richmond, Va.; and hereafter its supplies will be obtained at first hand at the market price. It is also rumored that the Imperial Company may carry the war into the United States and establish factories here.

#### THE SCIENCE OF METEOROLOGY.

An instructive paper by Prof. Cleveland Abbe, devoted to "Meteorology and the Position of Science in America," brings out many interesting facts regarding the work in this department of science done by American investigators. Professor Abbe declares that in this line of research American work is worthy of the highest praise, and has stimulated similar work in Europe. "As regards organization and practical results, the United States Weather Bureau, under Prof. Willis L. Moore, is doing the greatest and best work that has ever been done in any applied science; in its way, this bureau is equal to the Pasteur Institute or anything else that Europe has to show. No European would deny that, in this respect, America is easily the first in the world."

#### OTHER ARTICLES.

Lady Jeune writes on "The New Influence on the British Throne;" M. Gaston Deschamps on "America and France;" New York Health Commissioner Lederle on "Municipal Suppression of Infection and Contagion;" Gustav Kobbé on "Richard Strauss and His Music;" and Dr. Adolph Wagner, of Berlin University, on "Public Debt of the German Empire." The articles on "The Nature of Volcanoes," by Prof. N. S. Shaler, and "Strikes in the United States," by Commissioner Carroll D. Wright, have been quoted from in our department of "Leading Articles of the Month."

#### THE FORUM.

THE June number of the *Forum* is the last issue of that periodical as a monthly. Beginning with the July number, this review will be published quarterly. Its general character will remain the same. The June number opens with a discussion by Prof. Felix Adler of two questions connected with the American campaign in the Philippines: (1) Is it treason to condemn a war waged by our country while the war is still in progress? and, (2) Are civilized nations justified in adopting uncivilized methods of warfare? To the first question Professor Adler replies that it is not treason to condemn a war even while it is still in progress, if that war is sincerely believed to be unjust, and if by so doing there is hope to believe that we can prevent our country from continuing a wrong. The second question Professor Adler answers with an unqualified negative.

#### OUR GROWING DEPENDENCE UPON THE TROPICS.

Mr. O. P. Austin, chief of the Bureau of Statistics, shows that the chief growth of American imports in recent years has been in tropical and sub-tropical products. Within a short time, it seems probable that a considerable proportion of this trade may be carried on with our own tropical possessions. The Philippines, even in their present condition, supplied in 1901 more than twice the amount of tropical products furnished in 1899. The Hawaiian Islands contribute to our tropical requirements more than twenty-five times as much as they did in 1876, and they take more than twenty times as much of our products as they did then.

## A PROTECTORATE FORM OF GOVERNMENT.

In a discussion of "Representation and Colonial Government," Prof. Paul S. Reinsch describes and criticises the various methods adopted by European nations in the administration of their colonial dependencies, and reaches the conclusion that some form of protectorate is generally the most successful. "The essential thought in dealing with native societies should be that they must be on no account deprived of their *morale* and of their feeling of responsibility for their own destiny. Any government that attempts to begin their regeneration by setting aside their time-honored customs and degrading their natural leaders is, as has well been said, guilty of a murderous assault not merely upon an individual but upon a society, an organism with an even intenser life and higher destinies."

## CANADIAN RAILWAY RATES.

Prof. S. J. McLean, of the Stanford University, writes on "Railway Rate Regulation in Canada." After a special investigation as a commissioner of the Dominion Government, Professor McLean has found that many non-competitive rates are excessive in Canada as compared with competitive rates. Rates have been changed suddenly, and without notice. While this action has been within the provisions of the law, it has at the same time constituted a grievance. Rates on American shipments into Canada have been so arranged as to offset the geographical advantages of Canadian producers. Rates on short-distance traffic have been so high that commodities have been moved by wagon. On many commodities there has been extreme disproportion between the car-lot and less than car-lot rates.

## THE MUNICIPAL SITUATION IN OHIO.

Prof. S. B. Orth points out many anomalies in the charters under which Ohio cities are governed. For example, the city of Youngstown is provided with a mayor whose duty it is to hold police court, and who has no executive power whatever, not even the veto, except that he aids in appointing certain officials; a council, elected, whose duties are legislative; and a "bi-partisan" board of commissioners, composed of four men appointed by the mayor and the probate judge of the county. These commissioners must belong to the two political parties polling the highest votes in the city, and there must be two from each party. They have full administrative charge of the city, are responsible to no man, and can be only partially curbed by the council. Professor Orth seems justified in describing this as the most anomalous municipal law ever enacted.

## JAPAN'S MISSION IN THE FAR EAST.

Dr. T. Iyenaga, who contributed to the April number of the REVIEW OF REVIEWS an article on the Anglo-Japanese alliance, writes in the June *Forum* on "Japan's Mission in the Far East." Contrary to the assumption that this mission is mainly military and antagonistic to Russia, Dr. Iyenaga affirms that it is that of a mediator between the forces of the East and the West. Between the two opposed cultures of China and the Western nations, Dr. Iyenaga holds that it is Japan's mission to act as an "honest broker." "She has studied both, and knows both. Cannot China approach the Western civilization more easily through Japan than by herself or by being coerced by the Westerners? Cannot the West learn of China better and more easily through the inter-

pretation of Japan than by knocking its head against the inscrutable?"

## OTHER ARTICLES.

Mr. Charles Ely Adams writes on "The Real Hobo: What He Is and How He Lives;" Prof. W. J. Shearer on "Faulty Grading in Our Public Schools;" President Burke, of the San Francisco State Normal School, on "The Old Education and the New;" Prof. Moritz Levi on "Victor Hugo, the Novelist," and Dr. Henry O. Dwight, in a paper entitled "Among the Constantinople Bookshops," gives an account of the present literary tendencies in Turkey. We have quoted in another department from Mr. Albert G. Robinson's paper on "Our Legacy to the Cuban Republic."

## THE ARENA.

IN the *Arena* for June the imperial dreams of Cecil Rhodes are discussed by two writers—Reginald de Quinton, who describes himself an "an intimate business associate" of Rhodes, and Dr. Felix Oswald. Both writers recognize the valuation that Rhodes placed on material wealth, not as an end in itself, but merely as a means to the achievement of the loftiest purposes. Reginald de Quinton says that democratic federation was the ideal of his life. Dr. Oswald calls him a modern Cortez. The quality that he lacked was patience.

"He was worn out by the same impatience and vehemence of resentment that had killed Herman Cortez, and distracted and killed Suwaroff, Bonaparte, Byron, Ekobeleff, and Charles Parnell. And it must be admitted that the predominance of the characteristics that constitute the power of such men almost precludes the development of the gifts that insure the rewards of the cautious plotter. Energy such as theirs may be incompatible with patience. Their combination would imply temporary omnipotence, and is at least rare enough to explain the fact that a mission of destruction is apt to recoil upon the destroyer."

## THE BANISHMENT OF THE MODERN HERETIC.

The Rev. Robert E. Bisbee reviews the case of Prof. Charles W. Pearson, who resigned his chair in the Northwestern University, a Methodist institution, after expressing views which were condemned by some of the influential Church journals as heretical. The situation is thus described by Mr. Bisbee:

"A man may enter the Church in his youth with all sincerity, accept its doctrines on what seems to him an overwhelming weight of authority, may put all the strength of a mighty purpose into his work, and add thousands to the fold; but if, in the course of time, in the maturity of his powers, he comes to look at things in a new light, is forced by his convictions to discard some things he once held sacred and even essential, he must either repress his thoughts, hide his light, or get out. This is the cruelty of it. This is the echo of the Inquisition."

## RUSSIAN PROGRESS.

The Rev. James H. Ecob, D.D., writes enthusiastically of the progress of modern Russia under the agitations of Tolstoy and the literary school. Russia's last century, he says, has been an apocalypse:

"A recognized literature of masterful force and artistic grace; an intolerant religious system, honey-

corporations, thus destroying the chances of individual citizens, retarding the establishment of new enterprises, and placing the control of the markets in the keeping of the favored few, who, in turn, coerce the railroads into a continuance of these discriminations." Mr. Michelsen proposes that in the nationalization of the railroads the Government should not pay more than is warranted by the intrinsic value of the property, and the transfer would have to be effected with proper safeguards, similar to those under which several European governments have proceeded. It has been objected that one consequence of the purchase of the lines by the Government would be the great accumulation of wealth in a few hands, but to this objection Mr. Michelsen replies that the present system has a tendency to bring about precisely this result; and that, as the purchase of the railroads would probably be effected by means of bonds bearing a very low rate of interest,—redeemable after a reasonable length of time at the option of the Government,—the result would be that these securities would be employed as the bases for other investments for which the undeveloped resources of our country offer an unlimited field. The effect of the creation of a large office-holding class, dependent on the party in power, is not deemed by Mr. Michelsen to be ominous to the general welfare, since such a class already exists in the railway service, numerous attempts having been made at different times by the railway officials to control the vote of their employees, always without success.

#### AMERICA'S CONTROL OF ENGLAND'S FOOD SUPPLY.

Mr. J. D. Whelpley makes some startling assertions regarding the extent to which the food supply of Great Britain is in the control of the United States. He says: "If the United States were suddenly to stop all present regular exportations of meat and breadstuffs to the United Kingdom, the first effect would be an enormous rise in prices throughout Europe, and it would be but a few weeks before the English people would be threatened by dire famine, with no possible relief in sight so long as commercial relations with the United States were suspended." Mr. Whelpley then proceeds to offer a mathematical demonstration of the soundness of his assertions. Of the total importation of food staples by the United Kingdom, amounting to about \$800,000,000 a year, the United States furnishes about \$540,000,000, or 60 per cent. For meat alone the United States receives \$160,000,000, and of the trade in breadstuffs about \$150,000,000, or over 50 per cent. of the total.

#### THE TOBACCO WAR IN GREAT BRITAIN.

Mr. Lincoln Springfield gives an interesting account of the bitter fight between the American and British tobacco trusts to control the trade of Great Britain. The Imperial Tobacco Company, Limited, has been started with a capital of £15,000,000 (\$75,000,000) for the purposes of controlling the trade of Great Britain and Ireland. The president of the American Tobacco Company declared his intention of obtaining control of the entire tobacco trade of the United Kingdom. That declaration led to the formation of the Imperial Company, composed of thirteen of the best-known tobacco firms of England. The attempt of the American trust to capture the trade by cutting prices has thus far proved unsuccessful. Almost equally futile, it would appear, has been the extravagant expenditure for advertising purposes. The Imperial Company has estab-

lished branches for the purchase of tobacco at Richmond, Va.; and hereafter its supplies will be obtained at first hand at the market price. It is also rumored that the Imperial Company may carry the war into the United States and establish factories here.

#### THE SCIENCE OF METEOROLOGY.

An instructive paper by Prof. Cleveland Abbe, devoted to "Meteorology and the Position of Science in America," brings out many interesting facts regarding the work in this department of science done by American investigators. ## CANADIAN RAILWAY RATES.

Prof. S. J. McLean, of the Stanford University, writes "Railway Rate Regulation in Canada." After a full investigation as a commissioner of the Dominion Government, Professor McLean has found that many competitive rates are excessive in Canada as compared with competitive rates. Rates have been changed suddenly, and without notice. While this action has within the provisions of the law, it has at the same time constituted a grievance. Rates on American ships into Canada have been so arranged as to offset geographical advantages of Canadian producers. On short-distance traffic have been so high that commodities have been moved by wagon. On many commodities there has been extreme disproportion between the car-lot and less than car-lot rates.

## THE MUNICIPAL SITUATION IN OHIO.

Prof. S. B. Orth points out many anomalies in the forms under which Ohio cities are governed. For example, the city of Youngstown is provided with a mayor whose duty it is to hold police court, and who also exercises executive power whatever, not even the veto, but that he aids in appointing certain officials; a council, elected, whose duties are legislative; and a "artisan" board of commissioners, composed of men appointed by the mayor and the probate judge of the county. These commissioners must belong to two political parties polling the highest votes in the city, and there must be two from each party. They hold administrative charge of the city, are responsible to no man, and can be only partially curbed by the council. Professor Orth seems justified in describing this as the most anomalous municipal law ever enacted.

## JAPAN'S MISSION IN THE FAR EAST.

T. Iyenaga, who contributed to the April number of the *Review of Reviews* an article on the Anglo-Japanese alliance, writes in the June *Forum* on "Japan's Mission in the Far East." Contrary to the assumption that Japan's mission is mainly military and antagonistic to the West, Dr. Iyenaga affirms that it is that of a mediator between the forces of the East and the West. Between two opposed cultures of China and the Western world, Dr. Iyenaga holds that it is Japan's mission to act as an "honest broker." "She has studied both, and understands both. Cannot China approach the Western civilization more easily through Japan than by herself or through coercion by the Westerners? Cannot the West understand China better and more easily through the inter-

pretation of Japan than by knocking its head against the inscrutable?"

## OTHER ARTICLES.

Mr. Charles Ely Adams writes on "The Real Hobo: What He Is and How He Lives;" Prof. W. J. Shearer on "Faulty Grading in Our Public Schools;" President Burke, of the San Francisco State Normal School, on "The Old Education and the New;" Prof. Moritz Levi on "Victor Hugo, the Novelist," and Dr. Henry O. Dwight, in a paper entitled "Among the Constantinople Bookshops," gives an account of the present literary tendencies in Turkey. We have quoted in another department from Mr. Albert G. Robinson's paper on "Our Legacy to the Cuban Republic."

## THE ARENA.

IN the *Arena* for June the imperial dreams of Cecil Rhodes are discussed by two writers—Reginald de Quinton, who describes himself as an "intimate business associate" of Rhodes, and Dr. Felix Oswald. Both writers recognize the valuation that Rhodes placed on material wealth, not as an end in itself, but merely as a means to the achievement of the loftiest purposes. Reginald de Quinton says that democratic federation was the ideal of his life. Dr. Oswald calls him a modern Cortez. The quality that he lacked was patience.

"He was worn out by the same impatience and vehemence of resentment that had killed Herman Cortez, and distracted and killed Suwaroff, Bonaparte, Byron, Skobelev, and Charles Parnell. And it must be admitted that the predominance of the characteristics that constitute the power of such men almost precludes the development of the gifts that insure the rewards of the cautious plotter. Energy such as theirs may be incompatible with patience. Their combination would imply temporary omnipotence, and is at least rare enough to explain the fact that a mission of destruction is apt to recoil upon the destroyer."

## THE BANISHMENT OF THE MODERN HERETIC.

The Rev. Robert E. Bisbee reviews the case of Prof. Charles W. Pearson, who resigned his chair in the Northwestern University, a Methodist institution, after expressing views which were condemned by some of the influential Church journals as heretical. The situation is thus described by Mr. Bisbee:

"A man may enter the Church in his youth with all sincerity, accept its doctrines on what seems to him an overwhelming weight of authority, may put all the strength of a mighty purpose into his work, and add thousands to the fold; but if, in the course of time, in the maturity of his powers, he comes to look at things in a new light, is forced by his convictions to discard some things he once held sacred and even essential, he must either repress his thoughts, hide his light, or get out. This is the cruelty of it. This is the echo of the Inquisition."

## RUSSIAN PROGRESS.

The Rev. James H. Ecob, D.D., writes enthusiastically of the progress of modern Russia under the agitations of Tolstoy and the literary school. Russia's last century, he says, has been an apocalypse:

"A recognized literature of masterful force and artistic grace; an intolerant religious system, honey-

combed by the inroads of freethought; a new education; a new social spirit; an unparalleled advance in internal improvements; a reformed judiciary with attendant reforms in legal procedure and punishments; the rigors of militarism humanized; the concessions of autocracy to practical constitutionalism; the emancipation proclamation; the peace manifesto! What a century! Compared with the endless debates and forensic reforms and pamphlet victories of Europe and Europeanized America, Russia's day is as our thousand years."

## OTHER ARTICLES.

The Hon. Samuel C. Parks writes on "Causes of the Philippine War;" Dr. Charles Rollin Keyes on "The Physical Basis of History;" Mr. C. W. Penrose on "The Plural Marriage Problem;" Mr. B. O. Flower on "A Bit of Old Mexico;" and Mr. William Bailie on "The Ancient Working People." Mr. Elliott Flower quotes statements from several business men going to show that women are themselves to blame for failures to achieve marked success in the world of business.

## GUNTON'S MAGAZINE.

THE leading article in *Guntton's* for June is an ably written paper by Sixto Lopez, formerly a representative of Aguinaldo's government, entitled, "Do the Filipinos Desire American Rule?" This writer admits that it may be possible, by force of overwhelming numbers and superior equipment, ultimately to reduce the Filipinos to submission. But why, he asks, should all this be necessary, when the end can be attained by other and more humane means, and without crushing a laudable aspiration for national liberty, which America, of all nations, ought to encourage! A promise of ultimate independence, says Mr. Lopez, or even an intimation that such is the policy of the Administration, would remove not only all cause for a continuance of armed conflict, but all the sorrow of heart and bitterness of spirit on the part of the weaker contestant. "Under such a promise the Filipinos would willingly yield everything America is now demanding, or can in righteousness demand, and there would be additional mutual advantages. The Filipinos would learn of everything that is good in the institutions of America,—in its religion, its morality, its wisdom, and its law; while America would have a wider market for its products, a new field for commercial enterprises, and a basis of trade and military operations in the far East."

## LANDSTHING AND FOLKETHING IN DENMARK.

In an article on "Anomalies of Danish Politics," Mr. Harold C. Peterson explains why the Landsting is opposed to the transfer of the Danish West Indies, while the Folkething has favored it. The reasons for this apparent political anomaly are as follows: the Folkething, being elected by popular suffrage, is radical; while the Landsting, aristocratic in composition, is naturally conservative. The Folkething is elected by citizens twenty five years of age, and is composed of members elected for two years, representing each 16,000 inhabitants. The Landsting, on the other hand, is composed of sixty-six members, twelve of whom are nominated by the King, while the rest are elected for a period of seven years by electors who enjoy the income of a professional man in good standing, or who pay a certain amount of taxes; so that, according to Mr.

Peterson, the mass of citizens have even less control over the Landsting than the American voter has over the United States Senate. As to the general attitude of the Danish Government toward the transfer of the islands to the United States, Mr. Peterson says: "The West Indian question may properly be styled the Sindbad of present Danish politics. Even in the ranks of the radicals there is some discussion as to the advisability of the transfer, and it is known that the cabinet is also divided on the subject, the prime minister and four of his *confrères* being opposed to it. Nevertheless, they are sworn to carry it through, for the sale was one of the planks by which the left got to power."

## THE COAL INDUSTRY.

In an article on "The Development of the Coal Industry," Mr. William Gilbert Irwin says: "The aggregate value of the coal marketed in this country last year exceeded \$300,000,000 at the mines, and the sum total of the capital invested in the industry is almost beyond computation. Making due allowance for barren areas, the some 200,000 square miles embraced in the coal fields of the country are capable of producing 1,000,000,000,000 tons of coal. Had the operations in these fields been conducted on the same scale during the past six thousand years these fields would still be undepleted. Thus we get some idea of those vast mineral fuel resources which are destined to perpetuate the industrial supremacy of the country."

## THE INTERNATIONAL MONTHLY.

THE opening article of the *International Monthly* for June, by Prof. Scipio Sighele, of Rome, contrasts two kinds of imperialism,—the Latin and the Teutonic. The first, characteristic of the Latin race, was military and aristocratic; while the second, characteristic of the Teutonic race, is economic and capitalist. According to Professor Sighele, the ancient imperialism personified in the military conqueror, having the soldier as its only means of victory, and taxation as its only object, has been succeeded by the modern imperialism, impersonated in the successful trader. "Its best troops, those that have gained the greatest victories, do not consist of armed men, but of artisans, agriculturists, manufacturers, and engineers; its weapons of war do not carry sterility and death, but serve to perfect and to increase agriculture and industry, and are called railways, roads, electric ploughs, etc." While this imperialism, like the ancient form, seeks gain from the countries it subdues, it gains without impoverishing; instead of making the land a desert, as did the ancient imperialism, it improves and fertilizes it, often discovering natural wealth previously unsuspected.

## FROM WAR TO PEACE.

Mr. Henry Rutgers Marshall predicts that war will eventually become as perfunctory as dueling in our day has for the most part become. As the rules of procedure, which enabled the "seconds" at times to prevent mortal combat, so, says Mr. Marshall, the complex rules of diplomacy in our day serve to delay, and, at times, to prevent, international wars. Whereas, in former times war was carried on for destruction and rapine, it has now advanced to a stage where it is waged merely that one of the combatants may obtain acknowledgement of superiority, just as dualists nowadays fight only for acknowledgment of defeat, not, as

formerly, to cause the disablement or death of the antagonist.

#### TEMPERANCE AS A JEWISH NATIONAL QUALITY.

In an article on "Anti-Semitism in Europe," Rabbi Gottheil, of New York, dwells on the virtue of temperance which characterizes the Jews wherever they are placed, and makes them an object of envy to their non-Jewish neighbors. The Jew's home, says Rabbi Gottheil, is not in the church, but rather the church is in the home. The Jew's salvation is in no wise dependent upon rabbi and synagogue, but upon wife and children. The deepest roots of the Jewish faith rest on domestic soil. No man becomes a drunkard with wife, and children, and aged parents near him for guardian angels. The Jew, says Rabbi Gottheil, is a natural ally of the temperance advocates,—and if he is not in their ranks, it is simply because he never knew from experience the need of that reformation.

#### THE SOCIAL LIFE OF ANTS.

In concluding his sketch of "The Social Life of Ants," Prof. August Forel says:

"Compared to the manners of other sociable animals, and especially to those of man, the manners of ants exhibit a profound and fundamental aggregation of facts of convergence, due to their social life. Let me mention devotion, the instinctive sentiment of duty, slavery, torture, war, alliances, the raising of cattle, gardening, harvesting, and even social degenerescence through the attraction of certain harmful means of enjoyment. It would be ridiculous and erroneous to see in the fulfillment of this series of acts, individual reasoning, the result of calculated reflection, analogous to ours. The fact that each is fixed and circumscribed within one species, as well as the fatalistic character it has in that species, prove this superabundantly. But it would be as grave a mistake to refuse to recognize the deep natural laws that are concealed under this convergence. Is the case different as regards our actions though they are infinitely more plastic and more complex individually? I do not believe it.

#### THE SHIPPING TRUST AND THE WORLD'S PEACE.

Mr. Joseph B. Bishop, writing on "The International Shipping Trust," argues that the more closely the nations of the world are brought together in business interests and enterprises, the more firmly will they stand against war, or against anything that will disturb or injure their common welfare. "With the leading nations of the earth united in the ownership of a fleet of commerce, the need of naval armaments for the protection of the commerce of each nation will be eliminated."

#### OTHER ARTICLES.

Prof. Charles Diehl writes on "The Byzantine Empire and the Crusades;" Mr. Frank Miles Day on "The Formal Garden and its Revival," and Miss Ethel D. Puffer on "The Ideal of Beauty."

#### THE FORTNIGHTLY REVIEW.

THE *Fortnightly Review* for June is a good and varied number. The revival of interest in South African matters, which has resulted from the peace negotiations, is indicated by three articles dealing with South African affairs. We have dealt with these elsewhere. The first six pages are allotted to a not very

remarkable Coronation Ode by Mr. James Rhoades, and the number ends with Mr. W. L. Courtney's "Undine."

#### AMERICAN WIVES AND ENGLISH HOUSEKEEPING.

There is a brightly written paper under this title by Mrs. John Lane. Mrs. Lane is severe on the subject of English houses and housekeeping, and she finds the belief that it is cheaper to live in England than in America a delusion. The English coinage, by its divisions and subdivisions, conduces to waste; English houses, considering their inferiority, are dear; and in England the expense of service is greater, more servants being required to do the same amount of work. Mrs. Lane declares that English furniture is dearer and in worse taste than American, and that most articles of food are dearer in England.

"How I wish I could clap a big, stolid, conservative, frost-bitten English matron into a snug American house, with a furnace, and heaps of closet (cupboard) room, and all sorts of bells and lifts and telephones, and then force her to tell me the absolute, unvarnished truth! What would she say? I know!"

#### LIFE IN SPAIN.

"D" has a paper on "Social Life in Spain,"—a very interesting paper, dealing largely with the position of women in the peninsula. His verdict is a mixture of condemnation and approval. The subjection of women exists everywhere in Spain, but it is accompanied by many advantages.

"No other country in Europe can offer such a striking example of the solidarity of relationship, and in none other is the love of hearth and home so marked. The devotion in all classes between father and son, husband and wife, brother and sister, are among the finest traits of the popular character, and recall a time when, prior to the disintegrating process of civilization, blood was, in the best sense of the word, thicker than water."

#### WIRELESS TELEGRAPHY.

Mr. Marconi's article upon the practicability of wireless telegraphy is a simple narrative of what has been done since the first message by etheric wave in wireless telegraphy was sent by Lord Kelvin in 1898 down to November 15, 1899. The paper, therefore, does not touch in any way upon recent controversies as to the alleged telegraphy without wires across the Atlantic.

#### OTHER ARTICLES.

Mr. Arthur Symons writes on the sculptor Rodin; Mr. J. P. Hartog contrasts the English methods of teaching composition and style with the French methods, much to the disparagement of the English method; Mr. Joseph Morris writes on the dramatist Webster.

#### THE CONTEMPORARY REVIEW.

WE have noticed among the "Leading Articles" Prince Ukhtomsky's "Genius of China" and Mr. Volkovsky's "Russian Awakening," from the *June Contemporary*.

#### WOMEN IN AGRICULTURE.

Two papers deal with questions of importance concerning agriculture. Mrs. Bertram Tanqueray gives a lamentable account of the manners and morals of "gangs" of female agricultural laborers. She says that the tone of female field workers is exceedingly

low, their ideas of morality are small, and their speech full of expletives and obscenities. The Agricultural Gangs act of 1898 does not operate against this state of things, as there is no appointed inspector. The character of the gang-mistress is not always satisfactory, and Mrs. Tanqueray argues that an inspector should be empowered to see to this. Work in the fields is apparently not good even for the health of girls, as Mrs. Tanqueray says that the majority of the girls are physically weak and seldom healthy-looking. Colonel Pedder, in another paper, deals with the disintegration of country life, and foreshadows the time when farming will be carried on by great syndicates.

#### THE GROWTH OF FRAUD.

This is the title of one of Mr. Holt Schooling's statistical articles. It appears that while all other crimes have fallen in number within recent years, the various offences which come under the general title of "fraud" have largely increased. In 1885-89 there were in England and Wales 85,024 crimes reported to the police, and in 1895-99 the number of crimes had fallen to 76,860; but whereas the number of frauds reported in the first period was only 1,879, in the second it had risen to 2,599. While crime decreased nearly 10 per cent., frauds increased 38 per cent. Per million inhabitants the number of frauds had increased from 67 to 84. Mr. Schooling regards this as a very undesirable phenomenon, for whereas crimes generally usually inflict injury upon only one person, frauds very often injure or ruin thousands. Another serious phenomenon is, that while the number of frauds increased the percentage of persons tried for frauds diminished. In 1885-89, 54 persons were brought to trial for every 100 frauds committed, while in 1895-99 only 38 persons were brought to trial for every 100 frauds.

#### THE NINETEENTH CENTURY.

THE *Nineteenth Century* for June is largely devoted to economic problems. The papers on the shipping combine are dealt with elsewhere.

#### LONDON UNIVERSITY.

The most important of the other papers is Mr. Sidney Webb's, on London University. It is a long and elaborate article:

"What London University wants is a British 'Charlottenburg,'—an extensive and fully equipped institute of technology, with special departments for such branches as mining and metallurgy, naval architecture and marine engineering, railway engineering and hydraulics, electric traction and power-transmission, electro-chemistry, optics, the various branches of chemical technology, and all possible applications of biology. Such an institution, which could be begun on any scale on the land lying vacant at South Kensington, should admit only graduate students, or others adequately qualified, and should lay itself out from the first to be a place of research in which there would be no teaching, in the ordinary sense, but only opportunities for learning,—for every sort of investigation, carried out by professors and advanced students, individually and in coöperation."

Such an institute would cost £500,000 (\$2,500,000) to build. Mr. Webb adds that £250,000 (\$1,250,000) more would be needed for building and equipping a school of preliminary medical science; £250,000 more for the

extension and reëquipement of University College, and £30,000 or £40,000 a year for a great school of languages.

#### THE CHINESE DRAMA.

Mr. Archibald Little has an interesting article on the drama in China. The stage in China, he says, is almost exactly identical with the English stage in Shakespeare's time. There is a total absence of scenery. A motto adorns the rear of almost every stage in China with the words "We hold the mirror up to Nature." Actors are apprenticed as children, and many learn their parts without books. A mark of attention to a distinguished visitor is to hand him the repertoire and ask him to choose a play out of some hundred in the list, and Mr. Little says that he has often selected an unpopular and seldom-performed play and never found the test too much for them. Rough indications of scenery are given in a primitive way. Cavalry are indicated by a whip held in the hand, and when dismounting or attempting to ride off they go through the action of bestriding a horse. Women are forbidden on the stage; and actors, with barbers, are the only degraded caste in China, their children being inadmissible to the official examinations. The Chinese theater is always educative and moral; the *dénouement* is always the triumph of virtue.

#### ENGLAND AND THE LITTLE STATES.

Mr. Demetrius Boulger writes on this subject. He gives an account of the proposed union of Holland with Great Britain, which nearly came off, owing to Dutch fear of Prussian designs. Bismarck had been making speeches about Prussia's need of ports; and it was said that he had prepared an ultimatum calling on Holland to come into the North German Confederation. Holland, having failed to propitiate France by the sale of Luxembourg, turned to England as champion against Prussia. King William of Holland had then no likely heir, he had no thought of marrying a second time, and his sons were dead or dying. The negotiations for the union were carried on by secret channels; and Mr. Boulger says that one of the points discussed was Dutch representation in the Imperial Parliament. Mr. Boulger has no information as to why these secret negotiations broke down.

#### OTHER ARTICLES.

Capt. L. Oppenheim describes the fight with the Boers at Roival. Mr. W. L. Clowes deals with the career of Admiral Edward Vernon, who was dismissed from the navy in the eighteenth century for insubordination. Sir Joshua Fitch deals with the education bill.

Mr. Herbert Paul has a paper on George Eliot, written in his usual charming and penetrating way. Mr. Paul does not agree with Mr. Leslie Stephen, that George Eliot could not portray male character. In the end of his article he compares George Eliot with Tolstoy. "Resurrection," in its breadth and humanity, in the depth of its feeling, in the vividness of its satire, and in the width of its charity, reminds Mr. Paul of George Eliot at her best, the George Eliot of "Middlemarch."

#### THE NATIONAL REVIEW.

THE June number strenuously maintains the anti-German policy of the *National Review*. The editor warns his readers against the German astuteness which would employ the Morganeering shipping deal to set Britain against the United States. "Ignorant" be-

wails, under the title of "Another Graceful Concession," the permission given to Prince Henry and his German squadron to visit and use British bases in Irish waters. After Count Bülow's insolence to Mr. Chamberlain, this courtesy is, the writer affirms, sure to be misunderstood by Germany. Sir Rowland Blennerhassett, as reported elsewhere, sees in the rapid extension of the Pan-Germanic idea a deadly menace to England. Mr. Maurice Low reports that, in spite of Prince Henry's visit, it is always the German navy by which the American navy compares itself.

## OCTROIS OR CUSTOMS?

Sir Vincent Caillard replies to Sir Robert Giffen's *Nineteenth Century* argument against "the dream of a British Zollverein." He explains that what he asks for is, first, free trade between the colonies and the mother country, leaving free trade among themselves as an after consideration. He would distinguish duties on goods coming from other parts of the empire as *octroi* duties from the customs imposed on foreign goods. The editor rests his hope of the coming conference with colonial ministers resulting in a preferential system on Mr. Chamberlain, and Mr. Chamberlain alone. He even urges Mr. Chamberlain to leave the government and set up a new standard, rather than allow the colonies to think that Great Britain values her shibboleths more than her children.

## LADY SERVANTS.

Mrs. Francis Darwin writes on "Lady Servants" as the one way left of establishing domestic service on a reasonable and dignified basis. She mentions "The Guild of Dames of the Household," established in 1900. She insists that the arrangement by which servants sleep out of the house, possibly in boarding houses set apart for the purpose, is essential to a right basis of domestic service.

## OTHER ARTICLES.

M. J. Cornély, late editor of the *Figaro*, writes on the meaning of the French elections. They demonstrated the devotion of France to the Republic and to M. Waldeck-Rousseau's form of republicanism.

The editor applauds the *Times* history of the war, with its damning disclosures of British incapacity, but is courageous enough to adopt Mr. Seddon's views of the peace negotiations, that nothing short of unconditional surrender will be acceptable to the empire. So the *National* ushers in the month which sees peace established, but certainly not a peace based on the unconditional surrender of the Boers.

## THE WESTMINSTER REVIEW.

THE June number enforces the duty of national amendment with sermonic earnestness. Mr. W. D. MacGregor continues his review of the cause of the South African war, and refers to the annexation of the Kimberley diamond fields as a national disgrace. Mr. Alfred Marks neatly turns the tables on British critics of the Boer by showing how the English invented the expansive bullet and hailed the invention with delight; "how we rejected with lofty scorn all remonstrances against its use, how the invention has been turned against us, first by the Afriids, later by the Boers, till at last we have come to denounce as a criminal worthy of instant execution, without trial, an enemy using the weapon which we ourselves invented."

## BRITISH TAXATION.

"Tory Finance Exposed" is a vigorous attack on Great Britain's "patriotic" government. The writer contrasts the new taxes on "the workers" with the doles, old and new, to "the shirkers," and finds that during the last three years the "balance against workers and in favor of shirkers" reached the figure of £82,000,000 (\$410,000,000). The favorite specific of levying the land tax of four shillings in the pound on present values is insisted on; and with the £43,000,000 (\$215,000,000) which would be the result a democratic Chancellor of the Exchequer might pay members and election expenses (one million), abolish breakfast-table duties (five millions), give an old-age pension of seven shillings a week to every person over sixty-five (twenty-five millions), and repeal "Black Michael's" twopence-on-income tax, halfpenny a pound on sugar, and the shilling a ton on exported coal. The writer waxes jubilant over the statement that 750,000 persons affiliated to the Labor Representation League are paying 3d. a quarter, making an annual total of £37,500 (\$167,500).

## OTHER ARTICLES.

"Mugwump" strenuously pleads the cause of federation *versus* imperialism; and another article, on "Liberalism and Empire," urges on nations, as on individuals, the principle of "the liberty of each limited only by the equal liberties of all."

Mr. Lydston S. M. Newman contributes an eloquent plea for justice to Ireland. Mr. P. Barry argues for the development of South Africa, apart from the gold mines, by means of liberal outlay of credit. Mr. H. H. Smith would encourage the hard-working small proprietors, who have been the backbone of the West Indies, as opposed to the insatiable large landlord.

A very salutary lesson in critical humility is taught by J. M. Attenborough, in a paper on the first Edinburgh school of literary critics. The judgments passed by Hume and Blair on Shakespeare are ludicrous.

## THE MONTHLY REVIEW.

THE *Monthly Review* for June opens with an editorial article upon "Profit and Loss on the Atlantic Deal," which we have dealt with elsewhere.

## THE POSITION OF NAVAL ENGINEERS.

Lieut. Carlyon Bellairs, R.N., has a paper on "The Navy and the Engineers," in which he criticises unfavorably the contentions of naval engineers. The engineer performs mechanical duties in which ordinary professional ability qualifies for promotion by seniority; while the combatant officers, having the entire direction of the ships and a power of choice involving judgment, initiative, and courage to an abnormal extent, have to be carefully selected for employment and promotion. The navy must be based on the requirements of naval efficiency, and the directive power of a fleet cannot be undermined merely because the heart of the ship is mechanism.

"Greater responsibility for the safety of the ship must carry with it enlarged powers, and in all seriousness it must be asked, Is this the time to introduce into our ships a royal navy corps of engineers, with the titles and none of the essential functions of executive officers? Such a division of the part from the whole is known in politics as an *impertum in impertio*, and in a navy we know it well as the dry rot of a fighting force."

## THE TRUTH ABOUT SPION KOP.

Mr. Basil Worsfold contributes a defense of General Warren under the title of "The True Story of Spion Kop." His article is illustrated with a very good map. His contention is that the two allegations against Warren, that he failed to carry out Buller's instructions for the turning movement, and that he failed to make adequate arrangements for providing the force on Spion Kop with reinforcements and supplies, are both unfounded. Mr. Worsfold's argument is too elaborate to be summarized here, but he undoubtedly makes out a good case for Sir Charles Warren.

## OTHER ARTICLES.

There is an interesting story from "A British Official's Station Studies." The article deals with the customs of the Bechuanas in a charming manner, and it is a pleasure to find some one who can write sympathetically of the South African natives, and who does not regard them merely as potential mine-labor. There are two poems,—one by Mr. Newbolt; the other, a very short one, by Mr. Thomas Hardy. The illustrated article this month deals with musical instruments in Italian art. It is written by Mrs. Kemp-Welch. Mr. M. A. Gerothwohl deals with Maeterlinck's new play, "Monna

Vanna." Mr. Horace Round writes on the history and functions of the office of Lord Great Chamberlain.

## BLACKWOOD.

THE June number of *Blackwood's Magazine* recognizes the grave import of the *Times* history of the war for England's national reputation. The writer of "Musings Without Method" girds at Mr. Carnegie's depreciation of university education, and observes sardonically that his gift to the Scottish universities must have been intended to injure the business aptitudes of a whole nation. The writer laments that "presently the American ideal of life will be our own. 'All round people are ringing bells,' once wrote a witty critic of New York, 'telephoning, telegraphing, stenographing, polygraphing, and generally communicating their ideas about money to their fellow creatures by any means rather than the voice which God put in the larynx for the purpose of quiet conversation.' Before long London will tell the same tale; and though we are confident that reaction will follow some day, it is not an agreeable interlude that lies before us." The villain of the whole South African drama, the writer later avers, is Mr. Gladstone, with Mr. Froude next in turpitude.

## THE CONTINENTAL REVIEWS.

## REVUE DES DEUX MONDES.

WE have noticed elsewhere M. Dastre's article on "Life and Death." In addition to this paper, the most important contribution to the first number of the *Revue* deals with German ambitions in the East. The anonymous writer regards the incessant movements of Germanism, its ebb and flow, and the transformations of the German power as forming in reality the history of Continental Europe. Toward the West the rehabilitation of France, which has followed the war of 1880, is rightly regarded as forming a counterpoise to German expansion in that direction. But toward the East the domestic difficulties of Austria, the decay of the Ottoman Empire, and the feuds of the Danubian and Balkan nationalities have smoothed the path of German activities. In fact, Germanism tends more and more to concentrate on the East the whole force of its national action, and to regard the Slav race as its most serious adversary.

## THE BEGINNINGS OF TAINE.

Some early letters of Taine, the great historian, are noteworthy as revealing the state of mind of those struggling men of letters who flourished in the late forties and early fifties,—that is, on the eve of the Second Empire. That period of French history is beginning to prove very fascinating to the modern writer; and this is further shown in the second number of the *Revue*, containing several very good articles, of which profoundly interesting to the student of modern history is M. Ollivier's account of Napoleon III.'s half-brother, the brilliant and unscrupulous Duc de Morny, who may be said to have engineered the *coup d'état*, and who, had he lived, would certainly have prevented the Franco-Prussian war. It is often said that the existence of no human being is really indispensable to his friends and his country; that of Morny seems to have been of practically indispensable value to his

sovereign and to France. Louis Napoleon never alluded to their common origin; to have done so would have been to throw a slur on his much-loved mother's memory, but he was well aware that in his half-brother he had had a devoted friend and helper, and that his premature death struck a blow at the Second Empire from which it never recovered. M. Ollivier gives a striking account of Morny's last interview with the Emperor and with the Empress, but the same scene has been described with incomparable art by Alphonse Daudet, who made Morny the hero of one of his novels under the transparent pseudonym of "Duc de Mora."

## IN FAR UKRAINE.

Everything Russian is still the fashion in France, and Mme. Bentzon will find many readers for her vivid account of a journey through that portion of the great northern empire known as Little Russia. She considers that the peasantry of Ukraine have remained mediæval in many of their personal habits, in their ardent patriotism, and notably in their love of religious observances. While not caring for the Greek Orthodox rites, she was touched and charmed to find that in the Greek Church little children communicate, brought to the altar by their mothers in response to our Lord's words, "Suffer little children to come unto me."

## REVUE DE PARIS.

THE editors of the *Revue de Paris* are devoting more and more space to fiction. Of the sixteen contributions published in the two May numbers, seven consist of works of the imagination, the place of honor being given to a translation of d'Annunzio's "Giacocca" and Maeterlinck's drama "Monna Vanna."

## BELGIUM'S AFRICAN EMPIRE.

M. Wilmotte contributes an interesting paper on the Congo, and incidentally he gives a striking account of

Leopold II., the astute sovereign of Belgium to whom one of the smallest of European states owes what may develop into one of the most important of African territories. A little over twenty-five years ago Leopold II. convened at Brussels a meeting of explorers, of famous travelers, and of scientists. From this conference sprang the International African Association, and in the five years which followed six Belgian African expeditions admirably organized, and in each case commanded by Belgium military officers, had started for Central Africa with the full approval of the King. And so, little by little, Belgium acquired more and more territory, until, in 1885, King Leopold was proclaimed sovereign of the Independent Congo State. Leopold II. is apparently a believer in chartered companies, and at the present moment there are twenty-five such associations in the Congo State.

#### FROM GREECE TO SOUTH AFRICA.

M. Bérard is represented by two very different articles. The one entitled "Greek Origins" deals with the topography of old Greece. Under the somewhat ominous title of "The South African Affair," the same writer gives a most careful and intelligent analysis of Mr. Conan Doyle's now famous pamphlet, written avowedly with a view of presenting the British Imperialist case to the world at large. M. Bérard treats his adversary,—for adversary he considers the author of "The Great Boer War" to be,—with admirable courtesy and fairness; indeed, he goes further, and when telling the story of the concentration camps he admits frankly that far more was done to remedy the state of things than would have been done by any other country in a state of war. As he puts it, the famous English novelist's contribution to the war literature is a piece of very clever special pleading. Of course, M. Bérard entirely denies that the British empire has any special mission to fulfill to the world at large. In a striking passage he sums up the character and aspirations of Cecil Rhodes. Those who styled him the Napoleon of the Cape, he writes, were wrong; the title which would have best fitted him was the Alexander of Africa. Like Alexander the Great, his outlook was nobler and greater than that of Bonaparte. He bases his view of Rhodes' character on two articles which have appeared in the *REVIEW OF REVIEWS*,—that of November, 1899, and that published this last May. He tells the story of the negotiations which led to the outbreak of the war, and of the press agitation in favor of the Uitlanders; but he is willing to admit that the outbreak of hostilities would probably not have taken place when it did had it not been for the action of "that strange knight-errant, who, with his all-powerful name, William II., signed the famous telegram on the morrow of the Jameson raid."

#### NOUVELLE REVUE.

THE May numbers of the *Nouvelle Revue* are not as interesting as is sometimes the case with this publication.

Algiers has always been supposed to be the one prosperous French colony. M. de Pourville, who has made a special study of France's colonial empire, views the whole state of things there with profound pessimism. He points out that the French population of the colony does not increase, and indeed shows a tendency to grow less; while the native races, notably the Arabs, become more powerful, and are practically untouched by French

civilization. The Jew element is taking larger and larger proportions, and includes many Jews who, while nominally of French nationality, are really by birth Levantines, Greeks, Egyptians, and Italians. So important a part do the Jews now play in Algerian commerce and society that there has arisen a powerful anti-Semitic party, composed in a great measure of members of the old colonial families, who were very indignant at a law passed in 1870, which admitted every Jew showing a very short residence in Algiers to the full privileges of French nationality.

#### THE ROMANCE OF AUGUSTE COMTE.

Positivists will read with mixed feelings M. Pascal's very frank account of the curious love episode which so powerfully influenced Auguste Comte during the whole of the last part of his life. Unhappily married to a woman who from first to last proved utterly unworthy of him, and yet whom he had rescued from a degraded and wretched life, he came across, when forty-six years of age, the now famous Clotilde de Vaux, who, some sixteen years younger than himself, lived a life of austere grass widowhood, also the victim of a wretched marriage. Till this lady's death Comte cherished for her what must be called for want of a better name a platonic passion which powerfully influenced his whole views of life, and which seemed to increase in feeling after her somewhat premature death.

#### A REPUBLIC IN SPAIN?

Is Spain drifting toward a republic? Yes, says M. de Ricard, and to prove his belief he analyzes the various forces which are now contending against one another under the feeble rule of the newly crowned King. Unlike most foreign critics, he is no believer in the Queen mother, and indeed goes so far as to say that at no time during the last ten years has she known how to find a solution to any of the difficulties which confront the responsible ruler of Spain; on the contrary, she has gone on,—and so probably will her son, who is wholly under her influence,—much as did Napoleon III. during the later years of the Second Empire.

#### LA REVUE.

"LA REVUE" for May contains, as usual, a number of excellent literary articles, among which are some notes on Ibsen contributed by Mme. Rémusat, and a long article weighing the *pros* and *cons* as to whether Petrarch's house at Vacluse still exists; and if so, which it is. An article which is really fact, though it reads like fiction, is on Langallerie, a seventeenth-century adventurer, in the toils of Mme. de Maintenon.

M. de Croze discusses the ravages of alcoholism in Lower Brittany. Out of 6,885 young Bretons who came up for examination last year, 1,657 were referred to a second examination, and 702 exempted altogether,—and this largely because of the perpetual habit of drinking, especially among the women.

A curious article, suggested by the recent Holy Shroud discussions, is contributed by Dr. Cabanès on "The Death of Jesus in the Light of Contemporary Science." Dr. Cabanès' impartiality sums up the views of all the different scientists on the subject of how the crucifixion actually took place; to what death was actually due,—whether to exhaustion, to strain on the heart, or what; where the piercing with the spear took place, and the possibility of burial alive. Dr. Cabanès concludes that no definite theory is possible.

# THE NEW BOOKS.

## NOTES ON RECENT AMERICAN PUBLICATIONS.

### BIOGRAPHIES AND MEMOIRS.

TWO handsome volumes recently issued contain the Hon. George S. Boutwell's "Reminiscences of Sixty Years in Public Affairs" (McClure, Phillips & Co.). To few American public men has it been granted to participate actively in political movements for so long a period of time. Mr. Boutwell began his service in the Massachusetts Legislature in the forties, became governor of Massachusetts more than half a century ago, represented his State in Congress during and after the Civil War, was Secretary of the Treasury in President Grant's first administration, and served as Senator from Massachusetts in the seventies. During the last quarter of a century, while Mr. Boutwell has held no public office, he has written and spoken much on political topics, retaining a virility of thought and expression such as many a younger man might envy. The fact that his career has included long periods of activity in the legal profession has made his experiences the more varied, and contributes greatly to the interest of his memoirs. His acquaintance with men in many walks of life has been extensive, and his recollections are vivid. Not since the appearance of Blaine's "Twenty Years in Congress" has so important a collection of personal reminiscences in American politics come from the press.

"Herbert B. Adams: Tributes of Friends" is the title of a memorial volume published by the Johns Hopkins University at Baltimore in recognition of the distinguished service rendered by the late Professor Adams as head of the department of history. A unique and fitting contribution to the volume is the bibliography of the members of the department for the entire quarter-century of Dr. Adams' leadership. Many of the books and articles enumerated in this list were directly due to the suggestions of this inspiring teacher. Few, if any, university instructors in this country have influenced the literary activities of so large a number of students.

In the Appletons' series of "Life Histories," Secretary Thwaites, of the State Historical Society of Wisconsin, contributes an interesting sketch of "Father Marquette." Mr. Thwaites, as editor of the last complete edition of the famous "Jesuit Relations," has made a thorough and scholarly review of all the documentary materials pertaining to the historic Mississippi expedition of Marquette and Joliet. Mr. Thwaites, moreover, is intimately acquainted with the region traversed by Marquette, having himself made canoe voyages over the inland waterways made memorable by the Jesuit explorer, and from his knowledge of the country he is able to impart an unusual sense of reality to the entire narrative of Marquette's adventures. Marquette and Joliet, in the month of June, 1673, entered the Mississippi from the Wisconsin River, and descended as far south as the mouth of the Arkansas. They returned northward by way of the Illinois and Chicago rivers and the west shore of Lake Michigan, reaching the Jesuit mission at the rapids of De Pere, Wis., in September. Two years later, Marquette died on the site of the present city of Ludington, Mich., and the following

year some friendly Indians removed his bones to St. Ignace, where they were buried by his fellow Jesuits in a vault beneath the floor of their mission chapel.

The oration delivered by Mr. Samuel W. McCall at the centennial of Daniel Webster's graduation from Dartmouth College, which was celebrated in September last, has been published in book form (Houghton, Mifflin & Co.). This address has been generally accepted as a truthful and well-balanced estimate of Webster's character and career, and it well deserved the attractive garb in which it now appears.

A paper on Webster introduces a little volume of "Biographical and Other Articles," by William C. Todd (Boston: Lee & Shepard). Caleb Cushing, Thomas Hart Benton, and "Lord Timothy Dexter," of Newburyport, are among the other famous characters treated by Mr. Todd. Bits of rare and curious information, much of which was never before published, are incorporated in the papers.

At last, in "The True Aaron Burr," by Charles Burr Todd (New York: A. S. Barnes & Co.), we have an enthusiastic defense of an American in whom the historians, early and late, have found little to praise. The recently-circulated statement that the archives of the British, Spanish, and French governments reveal evidence of Burr's treason is repudiated by Mr. Todd, who challenges the production of such evidence. He asserts, on the other hand, that the Spanish archives at New Orleans and Mexico show that Burr intended by his "conspiracy" only the capture of Mexico and its ultimate annexation to the United States.

One of the most readable books of the season is a study of the Revolutionary patriot and martyr, Nathan Hale, by Mr. William Ordway Partridge, the sculptor, who has been occupied for five years in working out in marble his conception of the face and form of the young Yale graduate and school teacher whose unusual lot it was to dignify the office of a military spy and to become through this service, ennobled by its object, a national hero. (Funk & Wagnalls Company.)

A little book made up of tributes to the late Lewis G. Janes has been published at Boston (James H. West & Co.). Dr. Janes was distinguished in life for his contributions to philosophy, notably in the department of ethics. Most of the tributes included in this volume are from representative students and teachers who were associated more or less intimately with Dr. Janes in various educational activities.

"The True Napoleon," by Charles Joasselyn (New York: R. H. Russell), is a chronological record of events in the life of the First Napoleon, based upon many trustworthy authorities, and making no pretensions on its own account to originality. It is, in fact, what its title-page indicates—"a cyclopedia of events." A dozen very interesting and effective illustrations are included in the volume.

The matter of chief interest to American readers in the "Diary and Correspondence of Count Axel Fersen, Grand-Marshal of Sweden, Relating to the Court of France" (Boston: Hardy, Pratt & Co.), is contained in the count's letters to Field-Marshal Fersen, who was

his father, during the American Revolution. The count served as aide-de-camp to the Comte de Rochambeau. These letters are all included in the second chapter of the volume. Young Fersen embarked at Brest with the expeditionary corps of the French army of assistance to the American revolutionists in the spring of 1780. After taking part in the expedition to Rhode Island, he was present at the siege and capitulation of Yorktown, being employed by the Comte de Rochambeau in preference to the other aides during the conferences with Washington and the other officers of the American army. In fact, it is said that it was he who conducted the negotiations, and that this preference was founded not less on his personal qualities than on his knowledge of the English language. As in the case of the volumes of memoirs already published in this series, the translation from the French is the work of Katherine Prescott Wormeley.

"Meditations of an Autograph Collector," by Adrian H. Joline (Harpers), contains much anecdotal material of an entertaining nature relating to such historical characters as Charles Lamb, W. M. Thackeray, Laurence Sterne, Charlotte Brontë, Robert Burns, Samuel Johnson, John Keats, Joseph Addison, Alexander Pope, David Garrick, Sir Walter Scott, and Charles Darwin.

The stereograph record of William McKinley as President of the United States (New York: Underwood & Underwood) is a work of genuine historical interest and value. It consists of a series of sixty stereoscopic photographs of the late President at his official duties in Washington and on the memorable railroad journeys made across the country in the last year of his life. With the exception of the latest ones, each of the stereographs was examined through the stereoscope by the President, and received his personal approval. The descriptive text accompanying the pictures greatly enhances the educational value of the series. The stereograph as a means of instruction has already commended itself to educators, and is being introduced in a number of public schools. It offers an effective method of impressing the importance of historical events on the mind of the child. The Government uses stereoscopic photographs for instruction in the Military Academy at West Point.

#### A FEW RECENT VOLUMES OF HISTORY.

"The Boer Fight for Freedom," by Michael Davitt (Funk & Wagnalls Company), has been heralded as "the first authentic history of the Boer war from the Boer side." It will be remembered that Mr. Davitt resigned his seat in the British Parliament at the outbreak of the war, in October, 1899, as a protest against what he deemed to be the unjust aggressions of Great Britain. He soon proceeded to South Africa, and there was a personal witness to many of the dramatic incidents of the contest, becoming acquainted with such leaders among the Boers as President Steyn and Generals Botha, De Wet, and Delarey. In his account of the war, Mr. Davitt's style is journalistic, at times dramatic, and always entertaining, even though the partisanship which he is at no pains to conceal to a great extent vitiates the value of his work as history. The book amply fulfills the promises made in the advertisements. It gives the Boer side, and for that reason it will be read with avidity in this country, where the Boer cause from first to last had thousands of intense sympathizers.

"Uncle Sam, Trustee," by John Kendrick Bangs (New York: Riggs Publishing Company), is something of a surprise. We confess that Mr. Bangs, thanks to his brilliant reputation already made in other and very different literary lines, is not the writer to whom we should have looked for a concise, matter-of-fact record of the American administration in Cuba. Such a record, however, Mr. Bangs has given us in a dignified volume in which the only hint of whimsicality is suggested in the title. The book opens with an excellent summary of Cuban history, beginning with the era of discovery and Spanish settlement and coming down through the centuries to the memorable year of 1898. Then follows a brief account of General Wood's work at Santiago, a general survey of conditions in Cuba at the close of the Spanish war, and a series of chapters covering the progress made in the several departments of administration during the past four years. Mr. Bangs closes with a glowing tribute to General Wood and his corps of assistants for the magnificent manner in which they have fulfilled their tasks.

"The Rise of Religious Liberty in America," by Sanford H. Cobb (Macmillan), is not in any sense a history of the churches or of religion in America. The aim of the work is political rather than religious. In the language of the preface, "it attempts a systematic narrative,—so far as the author is aware, not hitherto published,—of that historical development through which the civil law in America came at last, after much struggle, to the decree of entire liberty of conscience and of worship." The author introduces the work with the definition of the American principle of religious liberty. This he follows with a description of the Old World idea of Church and State which was in force in Europe at the time of American colonization. He then proceeds to an account of colonial beginnings and the various church establishments in the colonies,—the Church of England in Virginia and the Carolinas, Puritanism in New England, Dutch Calvinism in New York, Catholicism in Maryland, and so forth. There are numerous footnote references to leading historical authorities.

"The Story of the Mormons," by William Alexander Linn (Macmillan), may also be described as a secular, rather than a religious, narrative. The writer classifies the books on Mormonism already in existence as follows: "Histories written under the auspices of the Mormon Church, which are hopelessly biased as well as incomplete; more trustworthy works which cover only certain periods; and books in the nature of 'exposures' by former members of the Church, which the Mormons attack as untruthful, and which rest in the mind of the general reader under a suspicion of personal bias." Mr. Linn has undertaken to present a consecutive history of the Mormons, from the date of their origin to the year 1901, and as regards the facts included in his account, he has relied largely on Mormon sources of information. Notwithstanding the almost universal acceptance of the belief that Joseph Smith, Jr., was the founder of the sect, Mr. Linn declares that the real originator of the whole scheme for a new church and of its doctrines and government was the now little-known Sidney Rigdon, for many years one of Smith's influential associates.

The second volume of "The Spanish Conquest in America," by Sir Arthur Helps (John Lane), now appearing in a new edition edited by M. Oppenheim, covers the colonization schemes of Las Casas, the ex-

ploring expeditions of Hernando Cortez, and the siege of Mexico by the Spaniards and their Indian allies. Facsimiles of sixteenth-century maps accompany the text.

"A History of Slavery in Virginia," by James Curtis Ballagh, constitutes an extra volume in the Johns Hopkins Studies in Historical and Political Science (Baltimore: Johns Hopkins Press). This is a study of the institutional character of American slavery. The author has investigated the legal and customary treatment of slaves in Virginia, from the beginnings of the colony down to the period of emancipation. He has given special attention to the social statistics of slavery and to penal legislation concerning slaves.

An interesting story of the Moravian Church, founded at what is now Salem, N. C., is related in "The History of Wachovia," by Dr. John Henry Clewell (Doubleday, Page & Co.). This history is based chiefly on original manuscripts and records preserved by the Salem Historical Society.

"The Lower South in American History" is the title of a volume of papers by Mr. William Garrott Brown (Macmillan). These papers have to do chiefly with the period preceding the Civil War, covering: (1) "The Rise of the Cotton States," (2) "The Ascendancy of the Lower South in the Union," and (3) "The Final Struggle in the Union." There are also papers on "The Orator of Secession," "The Resources of the Confederacy," "The Ku Klux Movement," "A New Hero of an Old Type" (Hobson), and "Shifting the White Man's Burden." These attempts to depict conditions of life in the old South, while confessedly incomplete, serve to suggest the outlines of what may eventually grow under Mr. Brown's hand into an elaborate and well-proportioned history of that important section of the Union.

Varied subjects are treated in a volume of papers by Mr. Charles Francis Adams (Houghton, Mifflin & Co.). Besides the study of "Lee at Appomattox," which gives the title to the book, there are two papers dealing with phases of the South African war, an essay on the need of a higher tone in our political discussions, and "A Plea for Military History," which is mainly a criticism on the defective treatment of military operations by historians. All of these essays embody the results of many years of experience in public affairs, and are written in a style that is always enjoyable.

In the "Cambridge Historical Series" (Macmillan), Mr. P. Hume Brown has written a two-volume "History of Scotland." The writer's preface to this work informs us that the latest critical opinion is inclined to reject or modify the conclusions accepted even by recent authorities on Scottish history. Especially is this true of the Roman occupation and the centuries that immediately follow. From materials that have come to hand in recent years, very much of the history of the last five hundred years has had to be virtually rewritten, so that we have in the present work an essentially new and distinctive history of Scotland.

Two new volumes in the series of "Mediæval Towns" (Macmillan), are devoted, respectively, to Cairo and Chartres. The former of these towns may be regarded as in the fullest sense a mediæval city, since it came into existence and had its most vigorous life during the Middle Ages, while it still retains much of its mediæval character and aspect. Chartres is also full of monuments of the Middle Ages, and with Mr. Headlam's book in hand the traveler who has only a few hours to spend in the old town may find much to interest him.

#### SOCIOLOGY.

Under the auspices of the Department of Social Sciences of Yale University there has been published a volume of "Statistical Studies in the New York Money Market," by John P. Norton (Macmillan). In this work the author has made an elaborate attempt to apply the mathematical methods of interpolation and correlation to the financial statistics of discount rates and banking items as published weekly by the financial journals. He has, however, tried as far as possible to subordinate the mathematical side of the work, and has made large use of graphic representation by means of charts.

A welcome addition to the publications of the New York State Library (Albany: University of the State of New York) is a bulletin giving a review of State legislation for 1901, edited by Dr. Robert H. Whitten, the sociology librarian. This review is made up of contributions by many specialists, each of whom gives a useful survey of the enactments of the year in the various States, with a special review of the subjects in which he is interested. Such treatment as this makes doubly valuable to legislators and students of comparative legislation a "Comparative Summary and Index" which has been issued by the New York State Library for possibly twelve years. As an introduction to the present bulletin, Dr. Whitten gives a brief review of modern work in comparative legislation.

The first course of "Yale Lectures on the Responsibilities of Citizenship," delivered by Justice Brewer of the United States Supreme Court, has been published in a small volume entitled "American Citizenship" (Scribners). In these lectures Justice Brewer presents what he terms a few plain, simple, commonplace truths. The line of treatment followed by the justice is indicated roughly by the titles chosen for the five lectures: "Obligations of Citizenship," "The Maintenance of a Good Character a Primary Obligation of Every Citizen," "Service a Responsibility of Citizenship," "Obligation of Obedience," and "The Duty of Striving to Better the Life of the Nation."

#### LABOR AND CAPITAL.

Several works dealing with modern industrial problems have recently appeared, and of these the one that is likely to attract the most general attention is the volume entitled "Labor and Capital: A Discussion of the Relations of Employer and Employed," edited by John P. Peters, D.D., of St. Michael's Protestant Episcopal Church, New York (Putnams). This book is made up on the "symposium" plan, and includes contributions from many well-known writers on various phases of the modern labor movement. The general subject of "Labor Unions" is treated by Mr. James B. Reynolds, President Gompers of the American Federation of Labor, President Keefe of the International Longshoremen's Association, and Secretary White of the United Garment Workers of America. There is also a discussion of "Trusts and Labor Unions from a Legal Aspect," by Messrs. George C. Holt, John Brooks Leavitt, and John De Witt Warner. The arguments for conciliation and arbitration of labor disputes are presented by Bishop Potter and Cardinal Gibbons, supplemented by the views of such specialists as Chairman Reed of the Massachusetts Board of Conciliation, Commissioner Carroll D. Wright of the United States Department of Labor, Labor Commissioner McMackin of New York State, and Mr. Charles Buxton Going of the *Engineering*.

ing Magazine. On the topic of "Compulsory Arbitration, favorable views are presented by Messrs. Walter Fieldhouse, Henry Demarest Lloyd, Conrad Reno, and Hugh H. Lusk, and unfavorable views by Chief Clark of the Order of Railway Conductors, President Mitchell of the United Mine Workers, and Secretary John M. Stahl of the Farmers' National Congress. Representative employers of labor give their opinions on "Voluntary Arbitration and Conciliation," while the sentiments of the employees on the same subject are voiced by President Martin Fox of the Iron Moulders' Association of America, and Frank P. Sargent, Grand Master of the Brotherhood of Locomotive Engineers. A section of the book is devoted to "Model Industries," covering schemes of profit-sharing and coöperation, and there is a full discussion of socialism and the single tax as remedies for modern industrial ills. Two questions relating to the unemployed—"Is Permanent Work with Comfortable Living Wage Possible for All in This Country?" and "How May Work and Workers Be Brought Together?" are briefly answered by Mr. Everett P. Wheeler, of the "East Side Settlement House in New York," and Mr. Jacob A. Riis, the author of "How the Other Half Lives."

In the collocation and arrangement of the utterances of so many experts on labor problems, Dr. Peters has rendered a valuable service to all earnest students of the subject. Not only are theorists represented in these discussions, but many practical men whose interests are involved in a speedy and equitable decision of the questions under discussion. In fact, the staff of contributors is made up on essentially the same lines as the well-known Arbitration Committee of the National Civic Federation, whose work was so prominently inaugurated in December last. The employers, the labor organizations, and the general public have all been invited to share in this expression of opinion.

To obtain a clear view of modern British trade-unionism in its various phases, the American student can do no better than to consult what has come to be regarded as the standard authority on the subject, namely, "Industrial Democracy," by Sidney and Beatrice Webb, of which a new edition has just been issued, the two volumes of the original work being bound in one (Longmans). Some idea of the scholarly thoroughness of this work may be gained from the fact that the investigation on which it was based occupied six years, in the course of which the authors examined, inside and out, the constitution of practically every trade-union organization, together with the methods and regulations which it uses to attain its ends. In an earlier work the authors traced the history of trade-unionism, and in the present volumes they attempt to give a scientific analysis of trade-unionism as it is to-day in the United Kingdom. An introduction to the new edition gives a full exposition of the various statutory changes made between 1897 and 1902, and the Australian legislation of that period is noted in detail.

Passing from the consideration of the rights and wrongs of organized labor, we find an exceptionally clear presentation of the claims of organized capital in "The Trust: Its Book," edited by James H. Bridge (Doubleday, Page & Co.). The latest phases of indus-

trial evolution as manifested in the United States are here set forth by Messrs. Charles R. Flint, James J. Hill, S. C. T. Dodd, Francis B. Thurber, all well-known and active representatives of the modern movement along the lines of capitalistic combination. The subjects discussed are "Combination and Critics," "History and Influence of Capital," "The Gospel of Industrial Steadiness," "Combinations and the Public," "An Alliance of Work, Brains, and Money," "Influence of Trusts upon Prices," and "What Combination has Done." There is also a collection of representative opinions on trusts from eminent public men, together with a carefully selected list of books relating to trusts.

#### ESSAYS ON SOCIAL THEMES.

Three recent volumes by clever British essayists deal with various social topics in an interesting manner. "Philosophy and Life," by Prof. J. H. Muirhead (Macmillan), while the psychological point of view is much in evidence, is an attempt to apply general principles of conduct to actual present-day problems, as in the essays on "What Imperialism Means," "The Science of Poor-Law Relief," and "Modern Methods of Temperance Reform." Of the papers not so strictly sociological in character, American readers will be attracted by this writer's presentation of "Robert Louis Stevenson's Philosophy of Life," "Abstract and Practical Ethics," "A Liberal Education," and "Psychology and Education."

Better known to Americans generally is Dr. W. Robertson Nicoll, the English critic and editor, who, under his well-known pseudonym "Claudius Clear," has collected "Letters on Life" (Dodd, Mead & Co.), a series of entertaining essays many of which have already appeared in publications accessible to American readers.

The third book in the group is said to be the work of "one of England's best-known statesmen." It is entitled "An Onlooker's Note-Book" (Harpers), by the author of "Collections and Recollections," and is composed of papers that appeared in the Manchester *Guardian* during the year 1901. Naturally the themes selected for treatment are largely political in character, and the author's exposition of "Individualism and Collectivism," "The Failures of Democracy," and "The Hope for Democracy" is especially interesting as an expression presumably representative of British thought on these subjects. There are also chapters on "Monarchy," which briefly sketch the history of the British throne from 1760 to the present day. The book as a whole is a book of anecdote and reminiscence rather than of philosophical speculation.

In this connection two little books by an American writer, Mr. Richard R. Bowker, on "The Arts of Life" (Houghton, Mifflin & Co.) deserve our attention. In one of these books Mr. Bowker treats of "Politics," and in the other of "Business." The latter volume contains a simple and straightforward exposition of current questions connected with the relations between labor and capital. The essay on politics is elementary, and contains a clear and succinct account of the modern American political system and its development.

# INDEX TO PERIODICALS.

Unless otherwise specified, all references are to the June numbers of periodicals.  
For table of abbreviations, see last page.

VOL. XXVI.

NEW YORK, AUGUST, 1902.

No. 2.

### THE PROGRESS OF THE WORLD.

*The King and His Illness.* England was the foremost center through last month of the world's important news. It was not until the middle of July that there was full assurance that King Edward was on the high road to recovery. For a few days after the news, late in June, of the King's illness and submission to a surgical operation, with the indefinite postponement of the coronation and the abandonment of the programme of festivities, there were throughout the world such manifestations of anxiety and friendly concern as were witnessed last year when the life of President McKinley was hanging by a thread. The people of the British dominions showed the most profound feeling, and in the United States there was unbroken unanimity in the expressions of sympathy and good will. It seems that Edward had suffered from exposure at Aldershot during the military reviews, and had come down with a chill and other serious symptoms on June 14. The coronation, as our readers will remember, was to have taken place on June 26. For a number of days the King's physicians made him husband his strength in order that he might be ready for the essential parts of the coronation programme; but on the 24th a medical consultation disclosed

the fact that the King was suffering from a gravely critical case of perityphlitis, this being a particular form,—by no means an uncommon one,—of what is generally called peritonitis. It was decided that the only hope for the King's life lay in an immediate surgical operation to remove an abscess that had formed near the appendix, and this decision was immediately given effect, the operator being that eminent surgeon, Sir Frederick Treves. But for modern advances in medical knowledge and in the surgical art, the King must undoubtedly have died on or about the date that had been set for the coronation.

*Favorable Convalescence.* The King's chief anxiety about it all was due to his desire that the people should not be disappointed, in view of their great preparations for the coronation. At first he insisted upon being carried to the Abbey, in order that the event might occur according to the programme. He was made, however, to understand the impossibility of any postponement of the necessary operation, which took place in Buckingham Palace, where subsequently the royal sufferer lay in a room facing the beautiful gardens. All this had come about so suddenly that the chief dignitaries of England were re-

THE INTERCESSORY SERVICE IN THE ABBEY AT THE VERY HOUR ON JUNE 26 THAT HAD BEEN ORIGINALLY FIXED FOR THE CORONATION.

hearsing for the coronation, and the guests of royal blood from various countries were assembling at a state dinner which it was too late to postpone, and at which Queen Alexandra bravely presided in the absence of the King. The operation came just in the nick of time, and although the chances of recovery were regarded as very dubious for a few days, the King steadily gained, without relapses of any kind, until the bulletins of the attending physicians were no longer frequent, and the royal patient was pronounced out of danger and recovering rapidly. On July 15, he was well enough to be removed from the palace by ambulance to a special train for Portsmouth, where he was taken on board the royal yacht *Victoria and Albert*, with the expectation of spending a good many days in the sheltered waters off Cowes, with short sails from that point, according to the weather.

Whether true or not, it was universally believed in England that the *Coronation Plans and Disappointments.* King's mind was much depressed by reason of the superstition that he would never be crowned. And it was reported that the physicians, on the one hand, and the royal family and

leading public men, on the other, had finally come to the conclusion that it would be in all respects advisable, especially for the sake of the King's equanimity, to have the coronation take place at the earliest possible moment. The plan

BUCKINGHAM PALACE, LONDON.

(The XX indicate windows of King's sick chamber.)

was to reduce the ceremony to the simplest terms, making it as brief as possible, and it was hoped that the King might be equal to the ordeal on or about August 9. It was not expected to recall the departed guests from other lands. Anxiety about the King's health, of course, threw into the background considerations of a less vital sort, but the disappointment was very great to some millions of people who, in one way or another, suffered loss or inconvenience. Looking back upon it all, it will doubtless be the verdict of most sober-minded people that England went somewhat too far in costly plans for an occasion which, however interesting, did not in its very nature lend itself to such exhaustive and protracted schemes of celebration. Some of the features of the programme that were abandoned might well enough have been carried out after the King had successfully undergone the operation, and this remark applies above all to the great naval parade, for which England's ships were assembled and ready. The street parade, of course, was out of the question, because the royal presence was to have been its one necessary

THE ROYAL YACHT "VICTORIA AND ALBERT," ON WHICH THE KING HAS BEEN LIVING.

factor. Hundreds of thousands of seats had been prepared all along the route that had been marked out for the parade, and the provision and sale of these seats had involved speculation and investment to an aggregate of some millions of dollars.

*The Quality  
of British  
Loyalty.*

In many other ways vast expenditures had been incurred which were rendered more or less futile by the abandonment of the coronation programme. But with so loyal a people as the British these things have

been counted as of little moment when compared with the good news of the recovery of the King. There is no other explanation for this feeling than the very simple one that finds right-mindedness and sound sentiment likely to prevail on such occasions. Obviously, all this anxiety about the King's recovery was not due to fear lest his death might bring either public or private misfortune to the realm, or to any class of the King's subjects. The stock market was not affected, and political circles as such were not agitated. If the King had died, Prince George would have come to the throne amidst as general good will as ever attended the accession of any sovereign in the history of

THE VIEW FROM THE WINDOW OF THE KING'S SICK-ROOM AT BUCKINGHAM PALACE.

the world. And since Prince George is of mature years, and thoroughly well known, his coming to the throne would have involved no surprises or uncertainties. Everything would have gone on exactly as before; public affairs would not have been appreciably affected, and the private citizen would have perceived no difference. In the case of Queen Victoria there had grown up, by reason of the great length and marvelous success of her reign, and especially by reason of her exemplary qualities as sovereign and as woman, a feeling of personal attachment and devotion on the part of many millions of her subjects. King Edward has had neither time

nor opportunity to grow into such a place in the hearts of the people. But to have been indifferent would have been cynical; and from the point of view of the prevailing patriotic standards in England, indifference would have been essentially disloyal, as well as morally shocking.

*Well-  
Conducted  
Royalty.*

The very fact that the King has been gravely ill, that his illness has called out appropriate expressions of sentiment, and that it has incidentally occasioned a good deal of disappointment and loss, will do more than anything else to give him a deep hold henceforth upon the affections of the people. It

AN INFORMAL PICTURE OF THEIR MAJESTIES KING EDWARD AND QUEEN ALEXANDRA.

will, on the other hand, add something to that new seriousness and dignity of character which Edward has seemed to show since his accession to the throne. Doubtless he will never wholly recover his former physical vigor, although he may live for a good many years. Queen Victoria was so great a figure that the royal family, as a whole, suffered a good deal in comparison. Now that she is gone and that her successor has been very close to the threshold, it is extremely interesting to observe that the royal family stands high in the esteem of the British people, and that it seems to have adjusted itself remarkably well to prevailing views and standards. Thus, the King's brother, the Duke of Connaught, is useful and respected, and is a military

figure of deserved prominence. The heir, Prince George, is practically competent as a naval officer, and he and his wife are universally popular, and are associated with nothing that scandalizes or offends the British public. It would, perhaps, be hard to find a time in all history when royal families in general were so exemplary, so well-conducted, so little given to mere indulgence and luxury, and so responsible and intentionally useful as at the present time.

Lord Salisbury, as we remarked last month, was expected by those best informed in English politics to make the coronation of the King and the end of the South African War the occasion of his formal

*Salisbury Out,  
Balfour In.*

THE RT. HON. ARTHUR BALFOUR.  
(The new British prime minister.)

retirement from political office. He did not allow the postponement of the coronation to change his plans, but merely waited until the King was well enough to be consulted and to name his successor as prime minister. Simultaneously with the announcement, on July 13, of Lord Salisbury's retirement, it was made known that the Rt. Hon. Arthur J. Balfour had been selected as his successor. There had been some idea that Mr. Chamberlain might succeed Lord Salisbury; but, although Mr. Chamberlain has undoubtedly come to be recognized as the most energetic and potent member of the government, he has continued to belong, nominally at least, to the Liberal Unionist party rather than to the Conservatives, although the Unionists have been acting with the Conservatives so generally upon most questions of policy that the distinction seemed to have lost much of its meaning. Mr. Chamberlain, moreover, while accepted as necessary by the rank and file of the Conservative politicians, is disliked by many of them, and Mr. Balfour was the one man upon whom it was easy for everybody concerned to unite as the immediate successor of his eminent relative. It happens, moreover, that Mr. Balfour and Mr. Chamberlain profess to be good friends, and it was made evident from the outset that Mr. Chamberlain was to be regarded as the foremost member of the Balfour administration. Mr. Balfour has very many qualifications for leadership, even if

he has also some shortcomings. His critics charge against him nothing worse than *dilettanteism*, lack of energy, and an occasional want of thorough knowledge of the matter in hand, due to indolence. On the other hand, he is a man of large views, of high character, of considerable and varied scholarship, of marvelous self-control and amiability, and of very effective qualities as a debater. Mr. A. Maurice Low characterizes him for our readers in an article in this number.

The present government was elected in October, 1900, on the strength of Lord Roberts' march to Pretoria and the declaration that the war was virtually at an end. The Conservative party was retained in power by a large majority, the present party balance in the House of Commons being about 400 supporters of the ministry, and about 270 opposition members, of whom 80 belong to the Irish contingent. Although there is a great deal of prevalent criticism of the party in power, the Liberal party continues to be lacking in unity and in definiteness of programme. There is no prospect, therefore, of any very early occasion for a dissolution of Parliament and an appeal to the country. One of the first announcements after the incoming of Mr. Balfour as premier was the impending retirement of Sir Michael Hicks-Beach as Chancellor of the Exchequer. Sir Michael and Mr. Chamberlain have differed

LORD SALISBURY AT HOME.

radically on many points. It was expected that a number of other changes would gradually take place in the ministry, although not in such a way as to result in its radical recasting. Mr. Chamberlain had been injured on July 7 by a street accident while driving in a cab, and this had kept him from the House of Commons, from participation in the party conferences apropos of the change of prime minister, and especially from the long-expected meetings of colonial statesmen, over which, in his capacity as Colonial Secretary, he was to preside. His disablement, however, was only temporary, and it was easy enough to postpone the more important sessions of the colonial representatives until his recovery. Conflicting rumors were current as to the place Mr. Chamberlain was to hold in the Balfour ministry. The more general opinion was that he would prefer to remain at the Colonial Office, in order to superintend the reconstruction of South Africa, and to direct other matters of colonial policy. Other reports were to the effect that Mr. Chamberlain would prefer to become Chancellor of the Exchequer, in which office he would have opportunity to give shape to his well-known ideas in favor of certain preferential tariff arrangements as between the home country and the colonies.

PROTECTION MASQUERADING.

RT. HON. SIR M. HICKS-BEACH, M.C.: "May I ask the lady's name? We have to be so very particular here."

RT. HON. JOSEPH CHAMBERLAIN (as Pierrot): "Oh, well, —er—put her down as Baroness von Zollverein."

From *Punch* (London).

SIR JOHN GORDON SPRIGG.

(Prime Minister of Cape Colony.)

Colonial  
Statesmen  
at London.

Various aspects of the relationship of the self-governing colonies to the United Kingdom and the empire were naturally under discussion at London in view of the presence there of the foremost statesmen of Canada, Australia, New Zealand, and other parts of the empire. Such questions as those of colonial contribution to imperial defense, the construction of cables under imperial direction and control, the granting of subsidies to steamship lines, and the encouragement of reciprocal trade, brought out the expression of

various opinions, and showed colonial statesmanship in a favorable light. One of the most striking results of the presence in London of an influential aggregation of colonial statesmanship was the abandonment by the British Government of its intention to suspend the constitution of Cape Colony. The prime minister of that colony is Sir John Gordon Sprigg, and the scheme as proposed would have taken practical administrative power out of his hands and that of his ministerial colleagues, supported by a majority in the

Cape Parliament. It would have placed the entire governmental authority in the hands of Lord Milner, the British High Commissioner, who would have been accountable only to the Colonial Office at London. The premiers of other self-governing colonies,—among them Mr. Barton of Australia, Mr. Seddon of New Zealand, and Sir Wilfrid Laurier of Canada,—could hardly be expected to regard with favor such a novel precedent as would have been established by the suspension of self-government in Cape Colony.

These great colonies have naturally come to regard themselves as independent countries for all such purposes as the domestic ordering of their affairs. The circumstances under which England could deprive the Canadians, for instance, of the right to govern themselves would have to be very serious indeed. The object of Milner's plan seems to have been to deprive the Cape Colony Dutch of their large influence in South African affairs. But, although the situation is fraught with difficulties of detail, it is evident that the only principle upon which England can retain any secure hold in South Africa is that of giving the majority there a free rein,—that, in short, of allowing the Dutch the liberty in Africa that the French enjoy in Canada.

**The return of  
Coronation  
Honors.**

Lord Kitchener, who arrived in London on July 12, was made the occasion of a great deal of official and public demonstration. Lord Kitchener and Lord Milner were among those upon whom coronation honors were conferred, both being advanced to the rank of viscount. The most interesting circumstance in the distribution of coronation honors was the creation of a new so-called Order of Merit, to

which twelve men were designated. This list included three soldiers, Lords Wolseley, Roberts, and Kitchener; two admirals, Seymour and Keppel; four men of science, Lords Kelvin, Rayleigh, Lister, and Sir William Huggins, the astronomer; one artist, Mr. George F. Watts; and two men of letters, Mr. W. H. Lecky and Mr. John Morley. Of Mr. Watts, we publish in this number an interesting sketch by Mr. Stead.

*As to the Philippine Friars.* Governor Taft's proposals to the Vatican at Rome,—which, as to their principal points, embodied the idea

that the United States should at a fair price buy the lands of the Spanish friars in the Philippines, and that the Vatican should withdraw the friars from the islands,—were, after several weeks of discussion, met by counter proposals on the part of the Vatican, delivered on July 9. These Vatican proposals were in twelve articles, most of which related to the land question, and provided specifically for the method of appraising the land and carrying the business to a conclusion. The withdrawal of the friars is not mentioned in the formal proposals, but in an accompanying note the Vatican declares that it is impossible to accede to the request of the United States on that score. It is intimated, however, that the Church authorities at Rome would see

that the friars caused no political friction in the Philippines, and it is implied that it would be the policy of the Vatican to replace gradually the Spanish friars with clerics of other nationalities, especially with Americans. The Vatican evidently expected that the United States would make further proposals, and that the period of negotiation at Rome would be prolonged. But Judge Taft, after awaiting instructions from Secretary Root, informed the Vatican, on July 16, that he would leave Rome on the 24th, and that it would be in accordance with the wishes of the United States Government if further negotiations were carried on at Manila between Governor Taft and the civil authorities on the one hand, and an apostolic commissioner, representing the Church, on the other hand.

*A Fairly Successful Mission.*

Judge Taft's mission at Rome resulted in a defining of the basis upon which it will evidently prove feasible to settle the land question, and to dispose of various other disputes relating to charitable, educational, and ecclesiastical property. As to the withdrawal of the friars, it must be remembered that this is a matter of no immediate concern to the American authorities. The people who are most inflexibly determined that these Spanish members of the religious orders shall leave the

islands are Catholic parish priests and the whole Filipino body of lay members of the Church. This hostility is so great that the friars have not for several years been able to occupy their lands, or to officiate in any way in the parishes where they were once powerful through the support of the Spanish Government. It is not difficult to understand, on reflection, that the Vatican should dislike to be put in the position of making a direct agreement to withdraw the friars. In the first place, this might be offensive to important elements of Church support in Spain; in the second place, it might be regarded as humiliating to the great world-wide orders of which these particular friars are members. What the Vatican would prefer would be to have this whole subject left to the discretion of the Church authorities, to be worked out gradually, and without any show of compulsion or pressure. It would probably be regarded as a violation of the treaty of peace with Spain if the United States should forcibly remove the friars from the Philippines. The great point, as it seems to us, is gained when the friars' titles to agricultural lands are extinguished by the payment of a fair compensation. The Vatican could have no motive for wishing to have the proceeds of the sale of these lands used for the reestablishment anywhere in the archipelago of wholly unwelcome

members of the religious orders. On one pretext or another, these friars will inevitably be withdrawn, and they will naturally go either to Spain or to the South American countries. Judge Taft's sojourn at Rome will have proved fairly successful in the end.

*Peace and  
Civil Rule in  
the Philip-  
pines.*

The Fourth of July becomes an important date in Philippine history through the amnesty proclamation of President Roosevelt issued at Manila on that day. It marked the end of military administration, declared peace to exist, and subordinated the army to the civil régime in accordance with the Philippine government act passed by Congress a few days before. The proclamation, of course, did not apply to the Moro tribes, or the regions inhabited by them, which will have to remain under a separate system. The President's full and free amnesty was granted to all persons in the Philippine archipelago who had in any way opposed the authority and sovereignty of the United States. This, of course, did not apply to persons convicted of ordinary crimes, and it further required the taking of an oath of allegiance. Separate proclamations of the same date expressed appreciation of the work of the army, and relieved General Chaffee from further duties as military governor, that office being discon-

BENEVOLENT ASSIMILATION.—From the *Herald* (New York).

BRIG.-GEN. GEORGE W. DAVIS, U.S.A.

(Who succeeds General Chaffee in command of the Department of the Philippines.)

tinued. The President and Secretary Root, in an eloquent review of the work of the army, expressed to the soldiers in the Philippines their high appreciation of all that had been accomplished. By July civil government had been established in every part of the archipelago where civilized people were living. The amnesty proclamation liberated about 1,800 Filipinos, most of whom were held as military prisoners. Aguinaldo, who was among those accepting the amnesty, predicts an era of prosperity, contentment, and happiness, and it is said that he is coming to the United States to study American institutions.

*Some Army Changes*

The abolition of the office of military governor is emphasized by the recall of General Chaffee from the Philippines, and his appointment to the command of the Department of the East, with headquarters at New York. He is succeeded in the Department of the Philippines by Gen. George W. Davis. The vacancy in the Department of the East is caused by the retirement of Gen. John F. Brooke from active service on July 18, he having attained the age limit. Gen. Loyd Wheaton, who was serving under General Chaffee in the Philippines, also retired on account of age a few weeks ago, with many compliments upon the faithful and valuable service he had

rendered for a period of more than forty years in the army. Gen. Jacob H. Smith was so unfortunate as to be retired last month on recommendation of Secretary Root, by express order of President Roosevelt, to emphasize the disapproval that was felt of his conduct in issuing verbal orders to Major Waller in the Samar campaign to use measures of retaliation not countenanced by the rules of war. General Smith, being past sixty-two, had reached the age of voluntary retirement, and his career as a whole is commended both by the Secretary of War and the President.

The long session of the Fifty-seventh *The Civil Government Act.* Congress came to an end on July 1.

The Philippine government bill, as finally agreed upon in conference between the two Houses on June 30, was passed on the same day by the House, and on the following morning,—that is to say, on the day of adjournment,—by

MAJ.-GEN. ADNA R. CHAFFEE, U.S.A.

the Senate, the Republicans supporting and the Democrats opposing it in both Houses. The House bill had called for a gold standard in the Philippines, and the Senate bill for the coinage of a special silver dollar. As an agreement on the question of monetary standards could not be reached, the whole subject was omitted from the final measure. It was agreed respecting a Philippine legislature that a census should first be taken, and that within two years thereafter the President should instruct the Philippine Commission

general election for the choice of delegates to a popular assembly. The House bill is more stringent than that of the Senate with respect to the sale of public lands and the grant of franchises, etc., and the Senate conferees have agreed on many of these points. If the Filipinos conduct themselves intelligently and sensibly, they will be a real legislative assembly of their own in a few years, and will be several centuries ahead of actual self-government than at any time before the arrival of Dewey in Manila Bay.

Congress always has to pass its regular appropriation bills, and no session of Congress can be called a failure in the management of ordinary income and expenditures wisely dealt with. On the side of income the recent session repealed the war taxes, and must be set down to its credit, although statesmanship would have dealt with the subject of public revenue in a more scientific manner. Meanwhile, the largest surplus ever in the history of any government had accumulated in the treasury, and Congress was unaccountably lavish, not to say reckless, in some of its expenditures. This remark applies especially to the river and harbor bill, upon which action was taken last month. No one can justly

criticise as too lavish, however, the provision made for the army and navy. The War Department deserves great credit for the steady reduction of the total army force, and the Navy Department provides for no more rapid increase in the number of our ships than the country, as a whole, is ready to approve. The appropriation for pensions has for some years past varied scarcely at all in amount. In the main, the recent session has dealt fairly well with its ordinary responsibilities touching the provision of revenue and the vote of supply for the regular departments of administration. In England they are grumbling (see cartoon on this page) because peace brings no promise of marked reduction in taxes. In this country, on the other hand, about one hundred millions a year have recently been cut off.

#### *The Canal Bill.*

Apart from these matters, Congress has accomplished two or three things of historical importance. Besides ending the military régime in the Philippines and creating a system of civil government of which we have already spoken, the recent session passed an interoceanic canal measure, and thereby made a contribution of profound significance to the future history of the activities of the whole world. Since the final choice of routes depended upon some considerations that could better be dealt with by the executive than by the legislative branch of the Government, the Panama route was selected only provisionally. The bill as passed authorizes the President to acquire for \$40,000,000 the property and franchises of the Panama Canal Company and the Panama Railroad Company's stock. He is also to acquire suitable control over a strip of territory six miles wide, by negotiation with the republic of Colombia. If satisfactory arrangements cannot be made, the President is authorized to revert to the Nicaragua route. Toward the cost of building the canal, provision is made for a popular two per cent. loan of \$130,000,000. The change of sentiment in Congress, from devotion to the Nicaragua route to a willingness to accept the Panama route, was due to the concurrence of several lines of argument; but it is not likely that final action could have been secured except for the remarkable shrewdness of the proposal which Senator Spooner made, and which carried everything before it. Since the Nicaragua advocates had held that the new Panama company could not give clear title, the bill as passed left them with some hope that the President would have to reject Panama and adopt the other alternative. From practical unanimity for Nicaragua, the House turned about and adopted the Senate's substitute of Panama, with hardly any opposing votes.

"HARD LINES."

BRITISH ASS (to himself): "Blest if I can feel a difference between this old gal and the one I got off!"—From *Punch* (London).

ABANDONED.—From the *Herald* (New York).

*As to Right of Way.* The bill also puts the State Department in a strong position for carrying on negotiations; for, if the Panama Canal Company does not clear up its franchise and titles in a satisfactory way, and if the republic of Colombia does not make favorable concessions as to the control of the necessary strip of land, the President may decide in favor of Nicaragua,—on condition, in turn, that the Nicaraguans offer favorable inducements. In our judgment, the outright purchase and annexation of the state of Panama would be preferable to the plan now on foot for some sort of lease of a six-mile strip. As we have frequently remarked, there is no precedent in all the history of the world for a nation's putting its most important and most costly public work upon alien soil. The retention of sovereignty over the state of Panama is of no real value to the republic of Colombia, and it would greatly clarify the situation for all future time if the Colombian authorities should sell the isthmus to the United States at a satisfactory price. The objection that this would be contrary to the constitution of the republic of Colombia is not conclusive to the minds of those who know how South American constitutions are made, revised, and amended. The acquisition of full sovereignty over the isthmus

would probably be a much easier matter to carry out in regular form, from the diplomatic standpoint, than the clearing up of the titles of the French company, whose original charters were forfeited some time ago, and which has nothing to sell us except an extended franchise obtained by means which its holders do not seem particularly eager to have explained. In any case, it will probably require two or three months to perfect a treaty with Colombia. Conditions are such in that country that, at the present time, no treaty could be made that would be other than the arbitrary ruling of the clique against whom a revolution has been more or less successfully raging for several years. The Attorney-General, Mr. Knox, who goes abroad this summer, will give some personal attention at Paris to the negotiations with the French company.

*Congress and Cuba.* Congress, in the opinion of the best intelligence and judgment of the country, was guilty of one great sin of omission in failing to live up to the moral obligation of the United States to do something for the economic relief of Cuba. It would have been nothing more than decent to have admitted all Cuban crops of the present year to the ports of the United States duty free. We had taken

control, and had spent Cuba's revenues freely in reconstructing matters according to our own ideas. It was due to our self-respect to give the new Cuban government a handsome send-off. Economic prosperity, as every one knew, was essential both to the success of Cuba's experiment in home rule and to the establishment of permanently satisfactory relations between Cuba and the United States. Certain Western agricultural interests, creditably eager to promote the development of the American beet-sugar industry, were used as a cat's-paw by a designing combination which, in turn, had power enough at Washington to prevent any action whatsoever. The situation became a very complicated and involved one; but its outlines will be clear in due time. Then it will be plain enough to those agricultural interests which fought against the decent treatment of Cuba on the plea that they were defending American producers, that they were playing all the time into the hands of those against whom they were in supposed antagonism. President Roosevelt and the administration had mapped out a policy that was honorable, patriotic, and best for all true American interests. The safe and right attitude on this Cuban question, which in its main features is in no sense a party matter, was to follow the lead of President Roosevelt. It is a subject that cannot be dismissed or forgotten. It will have to be talked about through the pending Congressional campaigns, and it will have to be brought up when Congress meets again. The situation as it exists in Cuba is set forth in an article which we publish this month from the pen of Mr. A. G. Robinson, who has spent a great deal of time in the island, whose knowledge is exceptional, and whose expressions of opinion are at least honest and independent.

*The Admission Bill.* In the closing days of the session, Senator Quay of Pennsylvania, supported by the Democrats, succeeded in bringing about a parliamentary situation which practically compelled the Republicans to name a day early in the next session for taking up the bill providing Statehood for Oklahoma, New Mexico, and Arizona. Mr. Quay's interest in this matter seems to have no connection with public interests, but to be due to circumstances of a personal sort. The Democratic Senators have made it a matter of party policy to favor the admission of these Territories, from which they would hope to gain strength both in Congress and in the Electoral College. We have more than once stated the objections to immediate admission. If the subject were dealt with apart from personal, political, and private interests, and upon

its pure merits, there would be no possible chance for the passage of the pending admission bill.

*Other Congressional Matters.* The navy bill, as finally passed, provided for the building of one of the new battleships in a government yard, and Brooklyn has been selected as the place, as against Boston and Norfolk, which were the other leading competitors. This experiment of direct building of a great warship by the Government itself will be watched with peculiar interest. Among other matters of importance dealt with in the recent session are to be mentioned the extension of the acts excluding Chinese laborers, and their application to the insular possessions of the United States. We mentioned last month the passage of the irrigation bill as involving a new policy destined to have results of the most stupendous importance. The establishment of a permanent census office is a notable matter. On the other hand, the expectation that Congress would create a new cabinet portfolio of commerce and industry failed completely.

*The Political Season.* Besides the Congressional elections in all of the forty-five States, most of which will occur on November 4, twenty-seven of the States have gubernatorial elections this year, and the majority also elect legislatures. Furthermore, many of the legislatures to be elected will have to choose United States Senators. Of the twenty-seven gubernatorial elections, one,—namely, Oregon,—comes early, and has already been held. Arkansas, Vermont, and Maine hold their State elections in September, and will choose governors and other State officers on September 1, 2, and 8, respectively. In Maine, Governor Hill will probably be reelected, and the State is expected to show normal Republican preponderance, although the Democrats are hoping to cut down the majority for the sake of a supposed influence upon the Congressional elections throughout the country. In Vermont a third ticket for governor has been put in the field by the Local Option League, which, on July 16, nominated Hon. P. W. Clement, of Rutland. Vermont has for a long time been a prohibition State, and Mr. Clement, who was a candidate for the regular Republican nomination for governor, is a leader in the movement to substitute a high-license and local-option law for the existing arrangement. Thus, the liquor question will play an unusual part in Vermont politics this year. In New York there has been incessant discussion of the subject of Democratic reorganization and harmony, and a long list of names has been suggested for the Democratic candidacy for governor; but most of those

Photo by Gutekunst.

EX-GOV. ROBERT E. PATTISON, OF PENNSYLVANIA.

named have promptly declared that under no circumstances would they accept. It is regarded as a settled fact that Governor Odell will be renominated by the Republicans. It seems also to have become the accepted opinion that President Roosevelt will have the unanimous endorsement of the Republicans of his own State of New York for a second term, Senator Platt and Governor Odell being the chief party spokesmen. The Pennsylvania Republicans, led by Senator Quay, have expressed themselves as strongly favoring Roosevelt; and since the President's popular strength in the Mississippi Valley and the far West is even greater, if possible, than in the East, the prospect of his renomination is exceptionally favorable. Many things, however, may happen in the course of two years. We mentioned last month the nomination of Judge Pennypacker as Republican candidate for the governorship of Pennsylvania. The Democrats have a strong candidate in Hon. Robert E. Pattison, who was elected governor in 1882, and again in 1890. The Democratic platform confines itself to State and local issues, which fact gives occasion for an amusing cartoon that we reproduce herewith. In Ohio, where there is no election for governor pending, there is no lack of political interest and activity, and the Democratic situation is decidedly factional, with Mayor Johnson of Cleveland and Mr. John R. McLean of Cincinnati leading the rival wings.

*Bryanism  
and the  
Democracy.*

The idea that Bryan and Bryanism are practically extinct, and that the whole Democratic party is ready either to forget or repudiate them, finds no justification in current political facts. The greatest Democratic State in the country is Texas, and on July 16 the State convention adopted a platform reaffirming the principles of the Kansas City document of 1900. That wing of the Texas democracy led by Senator Bailey was successful in controlling the convention, and the Hon. S. W. T. Lanham was nominated for governor. On the same date the Democrats of North Carolina met in convention, and they also endorsed the Kansas City platform on a square contest by a vote of 690 to 535. The Georgia Democrats, on the other hand, had in their convention of July 2 omitted all reference to Mr. Bryan and the Kansas City platform. North Carolina is not electing a governor; but in Georgia the Democrats have nominated for that office Hon. Joseph M. Terrell, in accordance with the decision of a primary election, an account of which is given in a brief article appearing elsewhere in this

TOO MIGHTY BIG TO BE SCREENED.

From the *Inquirer* (Philadelphia).

the Review. The Minnesota Democrats endorsed Mr. Bryan and the Kansas form on June 25, and at the same nominated L. A. Rosing for governor. The strength of Bryanism has also been shown in the Western States where fusion tickets were arranged between the Democrats and

In Nebraska, Mr. Bryan declined the fusion nomination, and the Democrats united upon W. H. Thompson, himself a Democrat. A fusion ticket has also been run in South Dakota, headed by John W. Thompson for governor. In Kansas a fusion ticket was fielded, W. H. Craddock being the gubernatorial candidate. Nothing in the near future will give free silver as a paramount party issue, but it does not follow that Bryanism is not a strong factor in the next national Democratic convention. The so-called Democratic harshness should, therefore, bear in mind that the Democrats are to be reckoned with, and that it is impossible to secure the Democratic nomination in 1904 for any man who was not an active supporter of Mr. Bryan in the last campaign.

Mr. Bryan himself has criticised severely the harmony meeting of the Tilden Club, which we referred last month, on the ground that it gave the principal place of honor and prominence to Mr. Cleveland, who had not supported the regular Democratic ticket at the last election.

It is understood that Mr. Cleveland's chief rival for 1904 is the Hon. Richard Olney, of Massachusetts; but unless present signs fail, the Democratic candidate will be a much younger man. Mr. Olney, and will come from New Hampshire or else from the South. Among the men whose names may come into great prominence in connection with the Democratic campaign are, first, Governor Montague of Virginia, second, Senator Bailey of Texas.

Mr. Bailey had been gaining ground rapidly as a Congressional figure.

Although a new member of the Senate, he was one of the youngest ever elected to that body, and had come to be recognized as the most eloquent debater and the most promising leader on the Democratic side of the chamber, before the last session came to an end. Since then he has shown himself able to control the party in his own State. Those, however, who thought well of him, and were willing to judge his seeming growth in capacity as a Senator, were greatly disappointed by the close of his character which had not been shown. Mr. Bailey had made serious charges against the solicitor of the State Department, and

esteemed public man from Indiana. Senator Beveridge, of Indiana, naturally came to the defense of an official from his own State whom he well knew, and he declared that Senator Bailey's charges and aspersions were unwarranted. Because Senator Beveridge could not withdraw his statement that the attack was unwarranted without himself reflecting upon his friend the State

SENATOR BAILEY, OF TEXAS.

Department official, Senator Bailey most absurdly chose to consider that he had been insulted; and he made a brutal and violent attempt to assault the Senator from Indiana. It will require several years of exemplary behavior for Mr. Bailey to live down the bad reputation this incident has given him. The quarrel was entirely on one side, Senator Beveridge

never for a moment losing his good temper. Mr. Beveridge's industry, courage, and sheer ability have already given him a high position in the Senate. As to the reflections upon the State Department and upon Mr. Penfield, the Foreign Relations Committee of the Senate will investigate.

*Mr. Spooner  
in Congress  
and at Home.*

The remarkable position attained in the Senate by Mr. Spooner, of Wisconsin, in the last session is set forth in an article elsewhere in this issue of the REVIEW from the pen of Mr. Walter Wellman,—an article, which, if eulogistic, does not exaggerate the facts. Mr. Spooner's usefulness as a public man, and its recognition by the country at large, ought to arouse the pride of the State of Wisconsin in so worthy a Senator. His term is about to expire, and the whole country hopes that he may be reelected; but the Republicans of Wisconsin have been sharply divided over certain State issues, and the convention held in the middle of July was dominated by Governor La Follette and his friends. A renomination was accorded to the governor, and a platform was adopted strongly advocating nominations by direct vote through primaries, and, further, certain taxation measures which are leading features in Mr. La Follette's policy for the reform of Wisconsin politics and government. Mr. Spooner's merits as a Senator were fully recognized by the convention; but his endorsement for another term was made conditional upon his express acceptance of those planks in the platform which, having no bearing

upon party doctrine, set forth the favorite projects of the governor. Mr. Spooner should be allowed to devote himself to national questions, and should be excused by both sides from participation at the present moment in controversies over strictly State and local matters.

*Northwestern Republicans.* The Republicans of Minnesota held their convention on July 1, and re-nominated Gov. Samuel R. Van Sant.

The Michigan Republicans, on June 26, had renominated Gov. Aaron T. Bliss. These three Northwestern States, — Michigan, Wisconsin, and Minnesota, — had, through a number of their representatives in the House, strongly opposed the Cuban reciprocity plan, and had been active and prominent in the movement of the so-called "beet-sugar insurgents." The Minnesota convention undertook in its platform to endorse at the same time President Roosevelt's demand for reciprocity and the position of the Minnesota representatives in their specific opposition. Minnesota wants to make sure that the sugar trust shall not derive benefit from the way in which reciprocity is applied. The Wisconsin convention did not express itself on the subject. The Michigan platform does not refer directly to the question of Cuban reciprocity, but by inference its strong endorsement of the protective tariff may be regarded as intended to convey the idea that reciprocity with Cuba would involve a weakening of the protective system.

*The Campaign Issues.* The Republicans at large are opposing the reopening of the tariff question at the present time, on the ground that the country is actually prosperous, that the tariff is working well, that no business interests are demanding any changes in it, and that no class of people has come forward to show that it suffers any injuries from the maintenance of the Dingley schedules. The Democratic campaign committee, on the other hand, has determined to make the tariff and the trusts the foremost issues in the November elections. A number of Republican platforms have endorsed President Roosevelt's position regarding trusts, and it may prove somewhat difficult for the Democrats to

GOVERNOR LA FOLLETTE,  
OF WISCONSIN.

establish their right to make any party capital out of that problem. The gratifying progress made in the adjustment of Philippine conditions leaves little room for partisan attacks in that direction, and the shrewdest of the Democratic leaders are well aware that nothing could be much more unpopular with the people than assaults upon our army in its splendid and self-sacrificing labors on the other side of the globe. The compulsory retirement of Gen. Jacob H. Smith by President Roosevelt has furnished sufficient proof to the country that the administration has not condoned any methods contrary to the rules of civilized warfare. The one thing for which the Republican party deserves to suffer severely in the Congressional campaign is its failure to deal honorably and efficiently with Cuba.

*Bituminous Coal Strike Averted.* The anthracite coal strike in Pennsylvania had continued without incidents startling enough to attract widespread attention until the holding of the national convention of the United Mine Workers at Indianapolis, on July 17 and the two following days. The object of this convention was to decide whether or not the bituminous miners of the country should strike in sympathy with the men of the hard-coal districts. President Mitchell was prepared to recommend in the most emphatic manner that the bituminousmen should remain at work in accordance with the wage-scale arrangements under which they were employed, and argued that the best way to help the hard-coal miners would be to contribute money regularly for their maintenance. The first proposition, that every miner should contribute a dollar a week from his wages, was modified in favor of a percentage plan which would yield as much, or more, money in the aggregate. It was also determined to look to other trade unions and to the general public for financial support, and to issue an address to the American people explaining the situation and stimulating sentiment in favor of arbitration. Among well-informed people in Pennsylvania the opinion was prevalent that the strike would continue for a considerable time to come. The employing interests involved were disseminating the view that the strike was on the point of disintegration. It was asserted that a considerable amount of hard coal was being mined, and that this amount would steadily increase. Large industrial consumers of hard coal, however, were finding it extremely difficult to obtain supplies. Meanwhile, it was said that a very considerable proportion of the mining population had gone away from the anthracite districts. It would, perhaps, be fortunate for all concerned if all these, and more besides, should find permanent employment elsewhere.

*General  
Business  
Conditions.*

Midsummer always brings its alarms about staple crops which are reported to be suffering from drought or excessive rain, or from some other cause. Particular localities, even in the best crop years, suffer from adverse conditions. Generally speaking, 1902 promises to be a good crop year. The rains injured considerably the winter wheat crop; but, taking the country as a whole, there will be at least an average yield of wheat, and the prospects for corn and cotton are very good. Labor controversies, apart from the anthracite coal strike, were as a rule finding solution, and the industrial situation was exceedingly good in all lines of manufacture. The iron and steel trades will show larger aggregates for 1902 than last year, which, in turn, had broken all previous records. A gratifying result of this unprecedented prosperity is the fact that the United States Steel Corporation has voluntarily advanced the wages of 100,000 employees 10 per cent., this advance applying to union as well as non-union men. Although there has been much talk about the purchase and consolidation of steamship lines under the auspices of Mr. J. Pierpont Morgan, there has not yet been announced the formation of any company representing the steamship aggregation. The suits against the Northern Securities Company are still pending, and it is probable that the delay in organizing the new steamship company has something to do with the principles involved in the Northern Securities litigation.

*In Spanish-  
America.*

The South American states are not in very satisfactory news relation with the outside world, but there were enough bulletins from Venezuela last month to show that the revolution had taken a new hold, and that President Castro had left his capital and taken charge of the troops in the field in what seemed to be a losing, defensive campaign. Our cruisers, the *Cincinnati* and the *Topeka*, were at La Guayra, and our minister, Mr. Bowen, on July 14, asked by cable for another warship. In Colombia the revolutionists have been suffering reverses, and Colombia has been giving some attention to Nicaragua on the charge that the Nicaraguans had been abetting the Colombian revolutionists for reasons relating to canal rivalry. The presence of the United States vessel, the *Marietta*, helped to restore order in Haiti, where earlier in the summer a revolution had resulted in the expulsion of President Jimenez, who has found in New York a safe and congenial refuge. New elections were pending in Haiti last month. Uruguay has been stirred up over an alleged plot to assassinate the President, who had accordingly

felt himself justified in disregarding the constitution and arresting a number of members of the legislature. The occasional recurrence of volcanic activity in the Lesser Antilles has ceased to attract much outside attention, although the situation is a very painful and unhappy one for the people who live there.

*French  
Affairs.*

The Venezuelan and French governments have entered upon a most admirable agreement for settling by arbitration the outstanding disputes due to various claims of French citizens. Each country is to appoint an arbiter, and M. de Leon y Castillo, the Spanish minister to Paris, is to be the third arbiter. The first two will settle as many points as possible, and all remaining differences will be settled finally and without appeal by the Spanish minister. This excellent arrangement will, of course, hold good no matter what faction succeeds in the civil war. The new French administration has taken hold of some very important questions. Premier Combes is enforcing the law relating to religious associations with unsparing rigor, and a great number of Church schools have accordingly been closed. M. Rouvier, the new Finance Minister, is proposing to make his term of official power memorable by a conversion to a 3 per cent. basis of that part of the permanent debt of France that now pays 3½ per cent.

*Affairs  
in Spain.*

In Spain, as well as in France, there is a strong movement on foot against the control of the Church in the educational field. A very drastic decree on this subject has been signed by King Alfonso. Señor Canalejas, who was a prominent member of the Sagasta ministry, resigned some little time ago, and he has been stirring up the country with an impassioned popular campaign against clerical domination. Apropos of King Edward's new Order of Merit, it is to be mentioned that there has been much agitation in Spain over appointments to King Alfonso's new order, to which it was announced that all the eminent Spaniards of science and letters would be named in the first group. The greatest difficulty arose over the question of including the rather liberal and modern-minded novelist Galdos, who has now, however, received his grand cross. The new treaty of trade, commerce, and amity between the United States and Spain was signed on July 3 by the Spanish foreign minister and our minister, Bellamy Storer, at Madrid. The new minister from Spain to the United States is Señor de Ojeda, who presented his credentials at the State Department on July 15. He is a most accomplished and intelligent gentleman, who points out

A FAMILIAR VIEW OF VENICE, SHOWING THE CAMPANILE, WHICH FELL LAST MONTH.

with force and wisdom the advantages that would ensue from a reciprocity treaty between Spain and the United States.

*Elsewhere  
Abroad.*

The German Agrarians are evidently not going to succeed with their tariff project. As was stated last month, the Reichstag has adjourned until October, and the Agrarians had apparently been told by Chancellor von Bülow that there is no chance for the success of their measure before the election of a new Reichstag, which was to occur next winter or spring. The agreement for the renewal of the Triple Alliance has been formally signed, but European alliances are no longer regarded as menacing or warlike; but, on the contrary, as factors for the maintenance of peace. The relations between France and Germany are gradually improving; Austria and Russia have a special understanding regarding the Balkans and the Eastern Question; while Italy and France have come into very good relations through general agreement upon their respective spheres in North Africa. Apropos of the French protectorate over Tunis, it is to be noted that the old Bey, Sidi-Ali, died not long ago, and that he has been succeeded by Sidi Mohamed. The fact that in the very period of the renewal of the Triple Al-

liance the King of Italy should be in Russia visiting the Czar, and that he was able to secure a promise that the Czar would visit him at Rome, makes plain enough that Germany's allies are not necessarily under strained relations with the ally of France. The whole civilized world was shocked at the news, on July 14, that the famous Campanile, or bell tower, of St. Mark's, at Venice, had completely collapsed. The Emperor Francis Joseph is apparently about to succeed in securing a renewal of the Austro-Hungarian customs union. The Austrian minister at Washington has been made an ambassador, and, in turn, our minister at Vienna, Mr. McCormick, has been promoted to like rank. Lord Hoptoun has thrown up in disgust the governor-generalship of Australia, the trouble being due to opposition to the plan for raising his salary from \$50,000 to \$100,000. Minister Wu Ting-Fang is needed in China for important service relating to a modernization of the laws of the empire, and Sir Liang-Chen-Tung, well known in this country and a Yale graduate, succeeds him. Our State Department has been rendering China great service of late, and as one result Tien-tsin is to be evacuated by the European powers this month. Ratifications of the Manchurian convention were exchanged at St. Petersburg on June 29.

PRINCES' STREET, EDINBURGH, WITH ITS CORONATION DECORATIONS.

## RECORD OF CURRENT EVENTS.

(From June 21 to July 20, 1902.)

### PROCEEDINGS IN CONGRESS.

**June 24.**—The Senate passes a bill for the purchase of a national forest reserve in the Southern Appalachian Mountains and ratifies an agreement with the Choctaw and Chickasaw Indians....The House closes general debate on the Philippine civil government bill.

**June 25.**—The Senate passes the army appropriation bill and postpones consideration of the bill admitting Arizona, New Mexico, and Oklahoma to Statehood till December 10.

**June 26.**—The Senate passes the general deficiency appropriation bill....The House, by a vote of 141 to 97, passes the Philippine civil government bill, and by a vote of 252 to 8 passes the Senate Isthmian canal bill, which goes to the President for signature.

**June 30.**—The House adopts the conference report on the Philippine civil government bill, and agrees to the appropriation of \$160,000 to meet the losses of the Charleston exposition in the general deficiency bill.

**July 1.**—An agreement is reached between House and Senate on the naval appropriation bill, by the terms of which one battleship is to be built in a government yard, and others in case of any attempt to restrict competition....The first session of the Fifty-seventh Congress adjourns.

### POLITICS AND GOVERNMENT.—AMERICAN.

**June 25.**—Nebraska Democrats and Populists agree on a fusion ticket, with W. H. Thompson for governor....South Dakota Democrats and Populists nominate John F. Martin for governor....Minnesota Democrats nominate Leonard A. Rosing for governor....Pennsylvania Democrats nominate ex-Gov. Robert E. Pattison for governor....Missouri Republicans name Theodore Roosevelt for President in 1904.

**June 26.**—Michigan Republicans renominate Gov. Aaron T. Bliss.

**July 1.**—Minnesota Republicans renominate Governor Van Sant and adopt a platform declaring for Cuban reciprocity and supporting President Roosevelt.

**July 2.**—Georgia Democrats nominate Joseph M. Terrell for governor (see page 170).

**July 3.**—Orders are issued by President Roosevelt establishing civil government throughout the Philippines and proclaiming amnesty for Filipino political prisoners.

**July 5.**—President Roosevelt issues an order forbidding persons in the classified civil service to use outside influence in attempts to secure promotion.

**July 16.**—Wyoming Republicans renominate De Forest.

BRIG.-GEN. GEORGE W. DAVIS, U.S.A.

(Who succeeds General Chaffee in command of the Department of the Philippines.)

tinued. The President and Secretary Root, in an eloquent review of the work of the army, expressed to the soldiers in the Philippines their high appreciation of all that had been accomplished. By July civil government had been established in every part of the archipelago where civilized people were living. The amnesty proclamation liberated about 1,800 Filipinos, most of whom were held as military prisoners. Aguinaldo, who was among those accepting the amnesty, predicts an era of prosperity, contentment, and happiness, and it is said that he is coming to the United States to study American institutions.

*Some Army Changes*

The abolition of the office of military governor is emphasized by the recall of General Chaffee from the Philippines, and his appointment to the command of the Department of the East, with headquarters at New York. He is succeeded in the Department of the Philippines by Gen. George W. Davis. The vacancy in the Department of the East is caused by the retirement of Gen. John F. Brooke from active service on July 18, he having attained the age limit. Gen. Loyd Wheaton, who was serving under General Chaffee in the Philippines, also retired on account of age a few weeks ago, with many compliments upon the faithful and valuable service he had

rendered for a period of more than forty years in the army. Gen. Jacob H. Smith was so unfortunate as to be retired last month on recommendation of Secretary Root, by express order of President Roosevelt, to emphasize the disapproval that was felt of his conduct in issuing verbal orders to Major Waller in the Samar campaign to use measures of retaliation not countenanced by the rules of war. General Smith, being past sixty-two, had reached the age of voluntary retirement, and his career as a whole is commended both by the Secretary of War and the President.

The long session of the Fifty-seventh Congress came to an end on July 1. The Philippine government bill, as finally agreed upon in conference between the two Houses on June 30, was passed on the same day by the House, and on the following morning,—that is to say, on the day of adjournment,—by

MAJ.-GEN. ADNA R. CHAFFEE, U.S.A.

the Senate, the Republicans supporting and the Democrats opposing it in both Houses. The House bill had called for a gold standard in the Philippines, and the Senate bill for the coinage of a special silver dollar. As an agreement on the question of monetary standards could not be reached, the whole subject was omitted from the final measure. It was agreed respecting a Philippine legislature that a census should first be taken, and that within two years thereafter the President should instruct the Philippine Commission

to call a general election for the choice of delegates to a popular assembly. The House bill was more stringent than that of the Senate with respect to the sale of public lands and the granting of franchises, etc., and the Senate conferees yielded on many of these points. If the Filipinos behave themselves intelligently and sensibly, they will have a real legislative assembly of their own within five years, and will be several centuries nearer actual self-government than at any time previous to the arrival of Dewey in Manila Bay.

*The Recent Session.* Congress always has to pass its regular appropriation bills, and no session of Congress can be called a failure in which questions of ordinary income and expenditure are wisely dealt with. On the side of income, the recent session repealed the war taxes, and this must be set down to its credit, although a higher statesmanship would have dealt with the whole subject of public revenue in a more scientific way. Meanwhile, the largest surplus ever known in the history of any government had accumulated in the treasury, and Congress was unquestionably lavish, not to say reckless, in some of its disbursements. This remark applies especially to the river and harbor bill, upon which we commented last month. No one can justly

criticise as too lavish, however, the provision made for the army and navy. The War Department deserves great credit for the steady reduction of the total army force, and the Navy Department provides for no more rapid increase in the number of our ships than the country, as a whole, is ready to approve. The appropriation for pensions has for some years past varied scarcely at all in amount. In the main, the recent session has dealt fairly well with its ordinary responsibilities touching the provision of revenue and the vote of supply for the regular departments of administration. In England they are grumbling (see cartoon on this page) because peace brings no promise of marked reduction in taxes. In this country, on the other hand, about one hundred millions a year have recently been cut off.

*The Canal Bill.* Apart from these matters, Congress has accomplished two or three things of historical importance. Besides ending the military régime in the Philippines and creating a system of civil government of which we have already spoken, the recent session passed an interoceanic canal measure, and thereby made a contribution of profound significance to the future history of the activities of the whole world. Since the final choice of routes depended upon some considerations that could better be dealt with by the executive than by the legislative branch of the Government, the Panama route was selected only provisionally. The bill as passed authorizes the President to acquire for \$40,000,000 the property and franchises of the Panama Canal Company and the Panama Railroad Company's stock. He is also to acquire suitable control over a strip of territory six miles wide, by negotiation with the republic of Colombia. If satisfactory arrangements cannot be made, the President is authorized to revert to the Nicaragua route. Toward the cost of building the canal, provision is made for a popular two per cent. loan of \$130,000,000. The change of sentiment in Congress, from devotion to the Nicaragua route to a willingness to accept the Panama route, was due to the concurrence of several lines of argument; but it is not likely that final action could have been secured except for the remarkable shrewdness of the proposal which Senator Spooner made, and which carried everything before it. Since the Nicaragua advocates had held that the new Panama company could not give clear title, the bill as passed left them with some hope that the President would have to reject Panama and adopt the other alternative. From practical unanimity for Nicaragua, the House turned about and adopted the Senate's substitute of Panama, with hardly any opposing votes.

"HARD LINES."

PATIENT BRITISH ASS (to himself): "Blest if I can feel a penn'orth o' difference between this old gal and the one that's just got off!"—From *Punch* (London).

ABANDONED.—From the *Herald* (New York).

*As to Right of Way.* The bill also puts the State Department in a strong position for carrying on negotiations; for, if the Panama Canal Company does not clear up its franchise and titles in a satisfactory way, and if the republic of Colombia does not make favorable concessions as to the control of the necessary strip of land, the President may decide in favor of Nicaragua,—on condition, in turn, that the Nicaraguans offer favorable inducements. In our judgment, the outright purchase and annexation of the state of Panama would be preferable to the plan now on foot for some sort of lease of a six-mile strip. As we have frequently remarked, there is no precedent in all the history of the world for a nation's putting its most important and most costly public work upon alien soil. The retention of sovereignty over the state of Panama is of no real value to the republic of Colombia, and it would greatly clarify the situation for all future time if the Colombian authorities should sell the isthmus to the United States at a satisfactory price. The objection that this would be contrary to the constitution of the republic of Colombia is not conclusive to the minds of those who know how South American constitutions are made, revised, and amended. The acquisition of full sovereignty over the isthmus

would probably be a much easier matter to carry out in regular form, from the diplomatic standpoint, than the clearing up of the titles of the French company, whose original charters were forfeited some time ago, and which has nothing to sell us except an extended franchise obtained by means which its holders do not seem particularly eager to have explained. In any case, it will probably require two or three months to perfect a treaty with Colombia. Conditions are such in that country that, at the present time, no treaty could be made that would be other than the arbitrary ruling of the clique against whom a revolution has been more or less successfully raging for several years. The Attorney-General, Mr. Knox, who goes abroad this summer, will give some personal attention at Paris to the negotiations with the French company.

*Congress and Cuba.* Congress, in the opinion of the best intelligence and judgment of the country, was guilty of one great sin of omission in failing to live up to the moral obligation of the United States to do something for the economic relief of Cuba. It would have been nothing more than decent to have admitted all Cuban crops of the present year to the ports of the United States duty free. We had taken

control, and had spent Cuba's revenues freely in reconstructing matters according to our own ideas. It was due to our self-respect to give the new Cuban government a handsome send-off. Economic prosperity, as every one knew, was essential both to the success of Cuba's experiment in home rule and to the establishment of permanently satisfactory relations between Cuba and the United States. Certain Western agricultural interests, creditably eager to promote the development of the American beet-sugar industry, were used as a cat's-paw by a designing combination which, in turn, had power enough at Washington to prevent any action whatsoever. The situation became a very complicated and involved one; but its outlines will be clear in due time. Then it will be plain enough to those agricultural interests which fought against the decent treatment of Cuba on the plea that they were defending American producers, that they were playing all the time into the hands of those against whom they were in supposed antagonism. President Roosevelt and the administration had mapped out a policy that was honorable, patriotic, and best for all true American interests. The safe and right attitude on this Cuban question, which in its main features is in no sense a party matter, was to follow the lead of President Roosevelt. It is a subject that cannot be dismissed or forgotten. It will have to be talked about through the pending Congressional campaigns, and it will have to be brought up when Congress meets again. The situation as it exists in Cuba is set forth in an article which we publish this month from the pen of Mr. A. G. Robinson, who has spent a great deal of time in the island, whose knowledge is exceptional, and whose expressions of opinion are at least honest and independent.

*The Admission Bill.* In the closing days of the session, Senator Quay of Pennsylvania, supported by the Democrats, succeeded in bringing about a parliamentary situation which practically compelled the Republicans to name a day early in the next session for taking up the bill providing Statehood for Oklahoma, New Mexico, and Arizona. Mr. Quay's interest in this matter seems to have no connection with public interests, but to be due to circumstances of a personal sort. The Democratic Senators have made it a matter of party policy to favor the admission of these Territories, from which they would hope to gain strength both in Congress and in the Electoral College. We have more than once stated the objections to immediate admission. If the subject were dealt with apart from personal, political, and private interests, and upon

its pure merits, there would be no possible chance for the passage of the pending admission bill.

*Other Congressional Matters.* The navy bill, as finally passed, provided for the building of one of the new battleships in a government yard, and Brooklyn has been selected as the place, as against Boston and Norfolk, which were the other leading competitors. This experiment of direct building of a great warship by the Government itself will be watched with peculiar interest. Among other matters of importance dealt with in the recent session are to be mentioned the extension of the acts excluding Chinese laborers, and their application to the insular possessions of the United States. We mentioned last month the passage of the irrigation bill as involving a new policy destined to have results of the most stupendous importance. The establishment of a permanent census office is a notable matter. On the other hand, the expectation that Congress would create a new cabinet portfolio of commerce and industry failed completely.

*The Political Season.* Besides the Congressional elections in all of the forty-five States, most of which will occur on November 4, twenty-seven of the States have gubernatorial elections this year, and the majority also elect legislatures. Furthermore, many of the legislatures to be elected will have to choose United States Senators. Of the twenty-seven gubernatorial elections, one,—namely, Oregon,—comes early, and has already been held. Arkansas, Vermont, and Maine hold their State elections in September, and will choose governors and other State officers on September 1, 2, and 8, respectively. In Maine, Governor Hill will probably be reelected, and the State is expected to show normal Republican preponderance, although the Democrats are hoping to cut down the majority for the sake of a supposed influence upon the Congressional elections throughout the country. In Vermont a third ticket for governor has been put in the field by the Local Option League, which, on July 16, nominated Hon. P. W. Clement, of Rutland. Vermont has for a long time been a prohibition State, and Mr. Clement, who was a candidate for the regular Republican nomination for governor, is a leader in the movement to substitute a high-license and local-option law for the existing arrangement. Thus, the liquor question will play an unusual part in Vermont politics this year. In New York there has been incessant discussion of the subject of Democratic reorganization and harmony, and a long list of names has been suggested for the Democratic candidacy for governor; but most of those

Photo by Gutekunst.

EX-GOV. ROBERT E. PATTISON, OF PENNSYLVANIA.

named have promptly declared that under no circumstances would they accept. It is regarded as a settled fact that Governor Odell will be renominated by the Republicans. It seems also to have become the accepted opinion that President Roosevelt will have the unanimous endorsement of the Republicans of his own State of New York for a second term, Senator Platt and Governor Odell being the chief party spokesmen. The Pennsylvania Republicans, led by Senator Quay, have expressed themselves as strongly favoring Roosevelt; and since the President's popular strength in the Mississippi Valley and the far West is even greater, if possible, than in the East, the prospect of his renomination is exceptionally favorable. Many things, however, may happen in the course of two years. We mentioned last month the nomination of Judge Pennypacker as Republican candidate for the governorship of Pennsylvania. The Democrats have a strong candidate in Hon. Robert E. Pattison, who was elected governor in 1882, and again in 1890. The Democratic platform confines itself to State and local issues, which fact gives occasion for an amusing cartoon that we reproduce herewith. In Ohio, where there is no election for governor pending, there is no lack of political interest and activity, and the Democratic situation is decidedly factional, with Mayor Johnson of Cleveland and Mr. John R. McLean of Cincinnati leading the rival wings.

*Bryanism  
and the  
Democracy.*

The idea that Bryan and Bryanism are practically extinct, and that the whole Democratic party is ready either to forget or repudiate them, finds no justification in current political facts. The greatest Democratic State in the country is Texas, and on July 16 the State convention adopted a platform reaffirming the principles of the Kansas City document of 1900. That wing of the Texas democracy led by Senator Bailey was successful in controlling the convention, and the Hon. S. W. T. Lanham was nominated for governor. On the same date the Democrats of North Carolina met in convention, and they also endorsed the Kansas City platform on a square contest by a vote of 690 to 535. The Georgia Democrats, on the other hand, had in their convention of July 2 omitted all reference to Mr. Bryan and the Kansas City platform. North Carolina is not electing a governor; but in Georgia the Democrats have nominated for that office Hon. Joseph M. Terrell, in accordance with the decision of a primary election, an account of which is given in a brief article appearing elsewhere in this

TOO MIGHTY BIG TO BE SCREENED.  
From the *Inquirer* (Philadelphia).

the REVIEW. The Minnesota Democrats endorsed Mr. Bryan and the Kansas platform on June 25, and at the same nominated L. A. Rosing for governor. The length of Bryanism has also been shown in other Western States where fusion tickets were arranged between the Democrats and Republicans. In Nebraska, Mr. Bryan declined the gubernatorial nomination, and the Democrats and Republicans united upon W. H. Thompson, himself a Democrat. A fusion ticket has also been placed in South Dakota, headed by John W. Thompson for governor. In Kansas a fusion ticket was in the field, W. H. Craddock being the gubernatorial candidate. Nothing in the near future will revive free silver as a paramount party issue, but it does not follow that Bryanism is not a strong factor in the next national Democratic convention. The so called Democratic harpers should, therefore, bear in mind that the forces are to be reckoned with, and that it will be impossible to secure the Democratic nomination in 1904 for any man who was not an ardent and active supporter of Mr. Bryan in the last campaign. Mr. Bryan himself has criticised the harmony meeting of the Tilden Club, which we referred last month, on the ground that it gave the principal place of honor and precedence to Mr. Cleveland, who had not supported the regular Democratic ticket at the last election. It is understood that Mr. Cleveland's successor for 1904 is the Hon. Richard Olney, of Massachusetts; but unless present signs fail, the Democratic candidate will be a much younger man than Mr. Olney, and will come from New York or else from the South. Among the young men whose names may come into great prominence in connection with the Democratic campaign are, first, Governor Montague of Virginia, and, second, Senator Bailey of Texas.

Mr. Bailey had been gaining ground rapidly as a Congressional figure. Although a new member of the Senate, he had come to be recognized as the most able debater and the most promising leader on the Democratic side of the chamber, before the recent session came to an end. Since then he has shown himself able to control the party action of his own State. Those, however, who thought well of him, and were willing to acknowledge his seeming growth in capacity as a man, were greatly disappointed by the revelation, almost at the very end of the session, of the phase of his character which had not been known. Mr. Bailey had made serious charges against the solicitor of the State Department, an

esteemed public man from Indiana. Senator Beveridge, of Indiana, naturally came to the defense of an official from his own State whom he well knew, and he declared that Senator Bailey's charges and aspersions were unwarranted. Because Senator Beveridge could not withdraw his statement that the attack was unwarranted without himself reflecting upon his friend the State

SENATOR BAILEY, OF TEXAS.

Department official, Senator Bailey most absurdly chose to consider that he had been insulted; and he made a brutal and violent attempt to assault the Senator from Indiana. It will require several years of exemplary behavior for Mr. Bailey to live down the bad reputation this incident has given him. The quarrel was entirely on one side, Senator Beveridge

never for a moment losing his good temper. Mr. Beveridge's industry, courage, and sheer ability have already given him a high position in the Senate. As to the reflections upon the State Department and upon Mr. Penfield, the Foreign Relations Committee of the Senate will investigate.

The remarkable position attained in the Senate by Mr. Spooner, of Wisconsin, in the last session is set forth in an article elsewhere in this issue of the REVIEW from the pen of Mr. Walter Wellman,—an article, which, if eulogistic, does not exaggerate the facts. Mr. Spooner's usefulness as a public man, and its recognition by the country at large, ought to arouse the pride of the State of Wisconsin in so worthy a Senator. His term is about to expire, and the whole country hopes that he may be reelected; but the Republicans of Wisconsin have been sharply divided over certain State issues, and the convention held in the middle of July was dominated by Governor La Follette and his friends. A renomination was accorded to the governor, and a platform was adopted strongly advocating nominations by direct vote through primaries, and, further, certain taxation measures which are leading features in Mr. La Follette's policy for the reform of Wisconsin politics and government. Mr. Spooner's merits as a Senator were fully recognized by the convention; but his endorsement for another term was made conditional upon his express acceptance of those planks in the platform which, having no bearing

upon party doctrine, set forth the favorite projects of the governor. Mr. Spooner should be allowed to devote himself to national questions, and should be excused by both sides from participation at the present moment in controversies over strictly State and local matters.

*Northwestern Republicans.* The Republicans of Minnesota held their convention on July 1, and re-nominated Gov. Samuel R. Van Sant.

The Michigan Republicans, on June 26, had renominated Gov. Aaron T. Bliss. These three Northwestern States, — Michigan, Wisconsin, and Minnesota, — had, through a number of their representatives in the House, strongly opposed the Cuban reciprocity plan, and had been active and prominent in the movement of the so-called "beet-sugar insurgents." The Minnesota convention undertook in its platform to endorse at the same time President Roosevelt's demand for reciprocity and the position of the Minnesota representatives in their specific opposition. Minnesota wants to make sure that the sugar trust shall not derive benefit from the way in which reciprocity is applied. The Wisconsin convention did not express itself on the subject. The Michigan platform does not refer directly to the question of Cuban reciprocity, but by inference its strong endorsement of the protective tariff may be regarded as intended to convey the idea that reciprocity with Cuba would involve a weakening of the protective system.

*The Campaign Issues.* The Republicans at large are opposing the reopening of the tariff question at the present time, on the ground that the country is actually prosperous, that the tariff is working well, that no business interests are demanding any changes in it, and that no class of people has come forward to show that it suffers any injuries from the maintenance of the Dingley schedules. The Democratic campaign committee, on the other hand, has determined to make the tariff and the trusts the foremost issues in the November elections. A number of Republican platforms have endorsed President Roosevelt's position regarding trusts, and it may prove somewhat difficult for the Democrats to

GOVERNOR LA FOLLETTE,  
OF WISCONSIN.

establish their right to make any party capital out of that problem. The gratifying progress made in the adjustment of Philippine conditions leaves little room for partisan attacks in that direction, and the shrewdest of the Democratic leaders are well aware that nothing could be much more unpopular with the people than assaults upon our army in its splendid and self-sacrificing labors on the other side of the globe. The compulsory retirement of Gen. Jacob H. Smith by President Roosevelt has furnished sufficient proof to the country that the administration has not condoned any methods contrary to the rules of civilized warfare. The one thing for which the Republican party deserves to suffer severely in the Congressional campaign is its failure to deal honorably and efficiently with Cuba.

*Bituminous Coal Strike Averted.* The anthracite coal strike in Pennsylvania had continued without incidents startling enough to attract widespread attention until the holding of the national convention of the United Mine Workers at Indianapolis, on July 17 and the two following days. The object of this convention was to decide whether or not the bituminous miners of the country should strike in sympathy with the men of the hard-coal districts. President Mitchell was prepared to recommend in the most emphatic manner that the bituminousmen should remain at work in accordance with the wage-scale arrangements under which they were employed, and argued that the best way to help the hard-coal miners would be to contribute money regularly for their maintenance. The first proposition, that every miner should contribute a dollar a week from his wages, was modified in favor of a percentage plan which would yield as much, or more, money in the aggregate. It was also determined to look to other trade unions and to the general public for financial support, and to issue an address to the American people explaining the situation and stimulating sentiment in favor of arbitration. Among well-informed people in Pennsylvania the opinion was prevalent that the strike would continue for a considerable time to come. The employing interests involved were disseminating the view that the strike was on the point of disintegration. It was asserted that a considerable amount of hard coal was being mined, and that this amount would steadily increase. Large industrial consumers of hard coal, however, were finding it extremely difficult to obtain supplies. Meanwhile, it was said that a very considerable proportion of the mining population had gone away from the anthracite districts. It would, perhaps, be fortunate for all concerned if all these, and more besides, should find permanent employment elsewhere.

*General  
Business  
Conditions.*

Midsummer always brings its alarms about staple crops which are reported to be suffering from drought or excessive rain, or from some other cause. Particular localities, even in the best crop years, suffer from adverse conditions. Generally speaking, 1902 promises to be a good crop year. The rains injured considerably the winter wheat crop; but, taking the country as a whole, there will be at least an average yield of wheat, and the prospects for corn and cotton are very good. Labor controversies, apart from the anthracite coal strike, were as a rule finding solution, and the industrial situation was exceedingly good in all lines of manufacture. The iron and steel trades will show larger aggregates for 1902 than last year, which, in turn, had broken all previous records. A gratifying result of this unprecedented prosperity is the fact that the United States Steel Corporation has voluntarily advanced the wages of 100,000 employees 10 per cent., this advance applying to union as well as non-union men. Although there has been much talk about the purchase and consolidation of steamship lines under the auspices of Mr. J. Pierpont Morgan, there has not yet been announced the formation of any company representing the steamship aggregation. The suits against the Northern Securities Company are still pending, and it is probable that the delay in organizing the new steamship company has something to do with the principles involved in the Northern Securities litigation.

*In Spanish-  
America.*

The South American states are not in very satisfactory news relation with the outside world, but there were enough bulletins from Venezuela last month to show that the revolution had taken a new hold, and that President Castro had left his capital and taken charge of the troops in the field in what seemed to be a losing, defensive campaign. Our cruisers, the *Cincinnati* and the *Topeka*, were at La Guayra, and our minister, Mr. Bowen, on July 14, asked by cable for another warship. In Colombia the revolutionists have been suffering reverses, and Colombia has been giving some attention to Nicaragua on the charge that the Nicaraguans had been abetting the Colombian revolutionists for reasons relating to canal rivalry. The presence of the United States vessel, the *Marietta*, helped to restore order in Haiti, where earlier in the summer a revolution had resulted in the expulsion of President Jimenez, who has found in New York a safe and congenial refuge. New elections were pending in Haiti last month. Uruguay has been stirred up over an alleged plot to assassinate the President, who had accordingly

felt himself justified in disregarding the constitution and arresting a number of members of the legislature. The occasional recurrence of volcanic activity in the Lesser Antilles has ceased to attract much outside attention, although the situation is a very painful and unhappy one for the people who live there.

*French  
Affairs.*

The Venezuelan and French governments have entered upon a most admirable agreement for settling by arbitration the outstanding disputes due to various claims of French citizens. Each country is to appoint an arbiter, and M. de Leon y Castillo, the Spanish minister to Paris, is to be the third arbiter. The first two will settle as many points as possible, and all remaining differences will be settled finally and without appeal by the Spanish minister. This excellent arrangement will, of course, hold good no matter what faction succeeds in the civil war. The new French administration has taken hold of some very important questions. Premier Combes is enforcing the law relating to religious associations with unsparing rigor, and a great number of Church schools have accordingly been closed. M. Rouvier, the new Finance Minister, is proposing to make his term of official power memorable by a conversion to a 3 per cent. basis of that part of the permanent debt of France that now pays 3½ per cent.

*Affairs  
in Spain.*

In Spain, as well as in France, there is a strong movement on foot against the control of the Church in the educational field. A very drastic decree on this subject has been signed by King Alfonso. Señor Canalejas, who was a prominent member of the Sagasta ministry, resigned some little time ago, and he has been stirring up the country with an impassioned popular campaign against clerical domination. Apropos of King Edward's new Order of Merit, it is to be mentioned that there has been much agitation in Spain over appointments to King Alfonso's new order, to which it was announced that all the eminent Spaniards of science and letters would be named in the first group. The greatest difficulty arose over the question of including the rather liberal and modern-minded novelist Galdos, who has now, however, received his grand cross. The new treaty of trade, commerce, and amity between the United States and Spain was signed on July 3 by the Spanish foreign minister and our minister, Bellamy Storer, at Madrid. The new minister from Spain to the United States is Señor de Ojeda, who presented his credentials at the State Department on July 15. He is a most accomplished and intelligent gentleman, who points out

A FAMILIAR VIEW OF VENICE, SHOWING THE CAMPANILE, WHICH FELL LAST MONTH.

with force and wisdom the advantages that would ensue from a reciprocity treaty between Spain and the United States.

*Elsewhere Abroad.* The German Agrarians are evidently not going to succeed with their tariff project. As was stated last month, the Reichstag has adjourned until October, and the Agrarians had apparently been told by Chancellor von Bülow that there is no chance for the success of their measure before the election of a new Reichstag, which was to occur next winter or spring. The agreement for the renewal of the Triple Alliance has been formally signed, but European alliances are no longer regarded as menacing or warlike; but, on the contrary, as factors for the maintenance of peace. The relations between France and Germany are gradually improving; Austria and Russia have a special understanding regarding the Balkans and the Eastern Question; while Italy and France have come into very good relations through general agreement upon their respective spheres in North Africa. Apropos of the French protectorate over Tunis, it is to be noted that the old Bey, Sidi-Ali, died not long ago, and that he has been succeeded by Sidi Mohamed. The fact that in the very period of the renewal of the Triple Al-

liance the King of Italy should be in Russia visiting the Czar, and that he was able to secure a promise that the Czar would visit him at Rome, makes plain enough that Germany's allies are not necessarily under strained relations with the ally of France. The whole civilized world was shocked at the news, on July 14, that the famous Campanile, or bell tower, of St. Mark's, at Venice, had completely collapsed. The Emperor Francis Joseph is apparently about to succeed in securing a renewal of the Austro-Hungarian customs union. The Austrian minister at Washington has been made an ambassador, and, in turn, our minister at Vienna, Mr. McCormick, has been promoted to like rank. Lord Hoptoun has thrown up in disgust the governor-generalship of Australia, the trouble being due to opposition to the plan for raising his salary from \$50,000 to \$100,000. Minister Wu Ting-Fang is needed in China for important service relating to a modernization of the laws of the empire, and Sir Liang-Chen-Tung, well known in this country and a Yale graduate, succeeds him. Our State Department has been rendering China great service of late, and as one result Tien-tsin is to be evacuated by the European powers this month. Ratifications of the Manchurian convention were exchanged at St. Petersburg on June 23.

PRINCES' STREET, EDINBURGH, WITH ITS CORONATION DECORATIONS.

## RECORD OF CURRENT EVENTS.

(From June 21 to July 20, 1902.)

### PROCEEDINGS IN CONGRESS.

**June 24.**—The Senate passes a bill for the purchase of a national forest reserve in the Southern Appalachian Mountains and ratifies an agreement with the Choctaw and Chickasaw Indians....The House closes general debate on the Philippine civil government bill.

**June 25.**—The Senate passes the army appropriation bill and postpones consideration of the bill admitting Arizona, New Mexico, and Oklahoma to Statehood till December 10.

**June 26.**—The Senate passes the general deficiency appropriation bill....The House, by a vote of 141 to 97, passes the Philippine civil government bill, and by a vote of 252 to 8 passes the Senate Isthmian canal bill, which goes to the President for signature.

**June 30.**—The House adopts the conference report on the Philippine civil government bill, and agrees to the appropriation of \$160,000 to meet the losses of the Charleston exposition in the general deficiency bill.

**July 1.**—An agreement is reached between House and Senate on the naval appropriation bill, by the terms of which one battleship is to be built in a government yard, and others in case of any attempt to restrict competition....The first session of the Fifty-seventh Congress adjourns.

### POLITICS AND GOVERNMENT.—AMERICAN.

**June 25.**—Nebraska Democrats and Populists agree on a fusion ticket, with W. H. Thompson for governor....South Dakota Democrats and Populists nominate John F. Martin for governor....Minnesota Democrats nominate Leonard A. Rosing for governor....Pennsylvania Democrats nominate ex-Gov. Robert E. Pattison for governor....Missouri Republicans name Theodore Roosevelt for President in 1904.

**June 26.**—Michigan Republicans renominate Gov. Aaron T. Bliss.

**July 1.**—Minnesota Republicans renominate Governor Van Sant and adopt a platform declaring for Cuban reciprocity and supporting President Roosevelt.

**July 2.**—Georgia Democrats nominate Joseph M. Terrell for governor (see page 170).

**July 3.**—Orders are issued by President Roosevelt establishing civil government throughout the Philippines and proclaiming amnesty for Filipino political prisoners.

**July 5.**—President Roosevelt issues an order forbidding persons in the classified civil service to use outside influence in attempts to secure promotion.

**July 16.**—Wyoming Republicans renominate De Forest.

THE SPECIAL CORONATION ANNEX TO WESTMINSTER ABBEY.

Richards for governor....President Roosevelt reprimands, and compulsorily retires, Brig-Gen. Jacob H. Smith, on account of his "kill and burn" order in the Philippines.

July 17.—Wisconsin Republicans renominate Gov. Robert M. La Follette, and declare in favor of the re-election of John C. Spooner to the United States Senate, on condition that he accept the principles of the State platform (see page 167).

#### POLITICS AND GOVERNMENT.—FOREIGN.

June 23.—Lord Milner is sworn in as governor of the Orange River Colony, in South Africa.

June 24.—An operation for appendicitis is performed on King Edward VII., and the coronation ceremony is indefinitely postponed.

June 25.—The British House of Commons passes third reading of finance bill by a vote of 236 to 181.

June 27.—The French Government orders the closing of 120 girls' schools established since the passing of the Religious Associations Law.

June 28.—The Swedish ministry resigns, and M. Boström undertakes the forming of a new cabinet.

June 30.—The conference of British colonial premiers is opened in London.

July 1.—The Prince of Wales reviews the British colonial troops in London.

July 3.—Venezuelan government troops under Gen. Modesto Castro, the President's brother, are routed by revolutionary troops under General Rolando.

July 4.—The finance bill passes third reading in the British House of Lords.

July 8.—The British Parliament discusses the Atlantic shipping combination.

July 9.—The French Chamber of Deputies, by a vote of 307 to 224, invalidates the election of Count Jean de Castellane, on account of his use of money.

July 11.—Lord Salisbury resigns the premiership of Great Britain.

July 12.—The Rt. Hon. Arthur James Balfour succeeds Lord Salisbury as prime minister of Great Britain (see page 161).

July 14.—Sir Michael Hicks-Beach resigns his portfolio as Chancellor of the Exchequer in the British Government.

July 17.—Earl Cadogan resigns the lord lieutenancy of Ireland.

July 18.—It is officially announced in London that King Edward's coronation will take place on August 9.

July 20.—Seyyid Alli is proclaimed Sultan of Zanzibar, with Prime Minister Rogers as regent.

#### INTERNATIONAL RELATIONS.

June 21.—Russia withdraws from the foreign government of Tien-tsin and from the foreign conference at Peking....The Chilean Senate ratifies the arrangement between the Chilean and Argentine governments.

June 28.—The Triple Alliance, or Dreibund, of Germany, Austria, and Italy is renewed at Berlin.

July 1.—China refuses to pay the July installment of the indemnity except at the rate of exchange prevailing on April 1, 1901, and in this attitude is supported by the United States.

July 3.—Governor Taft communicates to the Vatican the terms on which the United States proposes to acquire the land held by the friars in the Philippines.... A treaty of amity, commerce, and navigation between the United States and Spain is signed at Madrid.

July 4.—Thirty Bulgarians are killed by Turkish troops on the frontier.

July 9.—Negotiations with Colombia for a Panama Canal treaty are begun by the United States.

July 13.—Sir Liang Chen Tung is appointed Chinese minister to the United States....The King of Italy arrives at St. Petersburg as the guest of the Czar.

July 16.—Governor Taft presents to the Vatican the final statement of the intentions of the United States regarding the withdrawal of the friars from the Philippines....The Spanish Treaty Claims Commission decides that claims of American citizens for destruction

THE PRESENT EXECUTIVE MANSION OF THE UNITED STATES  
—PRESIDENT ROOSEVELT'S HOME AT OYSTER BAY, LONG ISLAND.

of property by the Cuban insurgents may be admitted to proof; and, further, that no legal state of war existed in Cuba during the insurrection prior to the Spanish American war.

July 17.—The Chinese foreign office accepts the terms for the withdrawal of foreign troops at Tien-tsin.

OTHER OCCURRENCES OF THE MONTH.

June 23.—President Mitchell, of the United Mine Workers, issues a statement giving the miners' side in the anthracite coal strike (see page 210). .... Fire causes heavy losses in the business portion of Portland, Ore.

June 23.—The Toronto street-railway strike is settled by a compromise.

June 25.—A wind-storm in Indiana causes damage estimated at \$2,000,000....President Roosevelt receives the degree of Doctor of Laws from Harvard University.

June 26.—It is announced that King Edward has established an Order of Merit in England, to which the following twelve men have been admitted: Lords Wolseley, Roberts, and Kitchener; Admirals Seymour and Keppel; Lord Kelvin, Lord Rayleigh, Lord Lister, and Sir William Huggins; Mr. George Frederick Watts (see page 183), and Mr. W. H. Lecky and Mr. John Morley.

June 30.—The American Association for the advancement of Science begins its sessions at Pittsburg.

July 3.—Fire at Lourenço Marques, in Portuguese East Africa, destroys British military stores valued at more than £500,000 (\$2,500,000).

July 4.—President Roosevelt makes a Fourth of July address at Pittsburg.

July 5.—King Edward's physicians announce that his Majesty is out of danger....President Roosevelt begins his summer vacation at Oyster Bay, Long Island.

July 6.—The centenary of Alexandre Dumas, the elder, is celebrated at his birthplace, Villers Cotterets, France....Destructive floods cause much damage in central and western New York State.

July 7.—A strike of freight handlers, affecting all the railroads entering Chicago, goes into effect; 9,000 men go out.

July 10.—A gas explosion in the Cambria mine at Johnstown, Pa., causes the death of more than 100 men....Thousands of people are rendered homeless by the high water in the Des Moines River, Iowa....The National Educational Association, in session at Minneapolis, chooses President Eliot, of Harvard, as its president.

July 12.—General Kitchener is welcomed in England, and made the recipient of many honors.

THE LATE GEN. THOMAS J. MORGAN.

(Famous as commander of negro troops in the Civil War, later distinguished as philanthropist, and Commissioner of Indian Affairs under President Harrison.)

July 14.—The famous Campanile of St. Mark's Church in Venice falls in ruins (see page 150).

July 15.—King Edward is taken to Cowes, Isle of Wight.

July 16.—The striking freight handlers at Chicago return to work, without concessions from the railroads. ....A strike ties up the street-railway system of Richmond, Va.

July 19.—The national convention of the United Mine Workers at Indianapolis declares against a general strike of bituminous miners and adopts President Mitchell's assessment plan for raising funds.

OBITUARY.

June 23.—Dean Sage, a prominent merchant of Albany, N. Y., 61....William Bement Lent, author of "Halcyon Days" and other books, 60....Charles T. Child, editor of the *Electrical Review*, 35.

June 24.—Hon. George Leake, Premier and Attorney-General of western Australia, 46.

June 25.—Ex-Justice Walter S. Cox, of Washington, D. C., who presided at the trial of Guiteau, the assassin of Garfield, 76....James Fergus, founder of Fergus Falls, Minn., and Montana pioneer, 89....Charles D. Poston, the "Father of Arizona," 80.

June 26.—The Rev. Dr. William Garden Cowle, Bishop of Auckland, 71....Maj.-Gen. Sir Francis Scott, who commanded Ashanti expedition, 1895-96, 67....Rt. Hon. William Lidderdale, director and ex-governor of the Bank of England, 70.

June 27.—Sir John Major Henniker-Major, Governor of the Isle of Man, 60....Justice Charles D. Long, of the Michigan Supreme Court, 61.

SIR MICHAEL HICKS-BEACH.

(Who retires from his post as Chancellor of the Exchequer in the British Government.)

THE FUNERAL OF KING ALBERT OF SAXONY.

(King Albert died on June 18, and was succeeded in the kingship by his brother, Prince George.)

June 28.—Judge Henry K. Baker, of Hallowell, Maine, 95.

June 29.—Gen. John Hendrickson, of New York, Civil War veteran, 70....Major Ira Alexander Shaler, civil engineer, 40.

July 4.—Hervé A. E. A. Faye, the astronomer, oldest member of the Academy of Sciences, 88.

July 7.—Chief Justice Marshall J. Williams, of the Ohio Supreme Court, 65....William Clark, the thread manufacturer of Newark, N. J., 61.

July 8.—James P. Stephens, of Trenton, N. J., one of the oldest pottery manufacturers in the country, 62....Mrs. Mary H. Cheeseborough, of Saratoga, N. Y., a miniature-portrait artist, 79.

July 9.—Judge William Marvin, of Skaneateles, N. Y., 94....Edmund J. Cleveland, a widely-known genealogist, of Hartford, Conn., 59....Mrs. Charles G. Ieland, an American woman well known in Europe, 71.

July 10.—Mrs. Annie Alexander Hector ("Mrs. Alexander"), the English novelist, 77.

July 12.—Archbishop Patrick A. Feehan, of the Roman Catholic archdiocese of Chicago, 73.

July 13.—Gen. Thomas J. Morgan, Civil War veteran, and corresponding secretary of the American Baptist Home Mission Society, 63.

July 14.—Sir Joseph Ignatius Little, Chief Justice and Deputy Governor of Newfoundland, 67....William Still, of Philadelphia, one of the most prominent members of the negro race, 80.

July 16.—The Very Rev. William Choka, vicar-general of the Roman Catholic diocese of Nebraska, 62.

July 17.—Brevet Maj.-Gen. Charles H. Smith, retired, of Maine, Civil War veteran, 75....Maj. Frederick W. Coleman, of Plainfield, N. J., Civil War veteran, 65....William Johnston, Conservative member of Parliament for South Belfast, 73....William H. Williams, general manager of the Union News Company, 63.

July 18.—The Sultan of Zanzibar....

Marquis Saigo, a distinguished Japanese statesman.

July 20.—John W. Mackay, American financier, 71.

THE LATE KING ALBERT OF SAXONY.

## FORTHCOMING EVENTS.

THE following conventions have been announced for this month: American Bar Association, at Saratoga Springs, N. Y., on August 27-29; American Fisheries Society, at Put-in-Bay, Ohio, on August 5-7; American Forestry Association, at Lansing, Mich., on August 27-28; League of American Municipalities, at Grand Rapids, Mich., on August 27-29; American Park and Outdoor Art Association, at Boston, on August 5-7; Universalist Church of America, at Old Orchard, Maine, on August 1-10; Friends' International Christian Endeavor Convention, at Richmond, Va., on August 8-10; National Federation of Catholic Societies, at Chicago, on August 5-7; Catholic Total Abstinence

Union, at Dubuque, Iowa, on August 6-9; Salvation Army Encampment, at Old Orchard, Maine, on August 16-September 3; General Conference of Christian Workers of the United States, at East Northfield, Mass., on August 1-September 7; Brotherhood of the Kingdom, at Morristown, N. J., on August 4-8; Trans-Mississippi Congress, at St. Paul, on August 19-23; National Fraternal Congress, at Denver, on August 26-30; National Society of the Army of the Philippines, at Council Bluffs, Iowa, on August 14-15; National Postmasters' Association, at Milwaukee, Wis., on August 26-29; and the National Negro Business League, at Richmond, Va., on August 25-27.

# SOME CARTOON COMMENTS OF THE MONTH.

THE VIGIL.—June 26.

- Silent it stands, the shrine within whose walls  
He was to give his kingly gaze to-day;  
And silent on our hearts the sorrow falls  
Which only faith may stay.
- Not for ourselves we mourn the moment's loss,  
Our pleasure darkened and our sun gone down;  
All thoughts are turned to where he bears the cross  
Who should have worn the crown.
- So keep we vigil; so a Nation's prayer  
Humbly before the Eternal Heart we bring,  
That of His grace and pity God may spare  
And give us back our King!

# THE NEW BRITISH PREMIER.

BY A. MAURICE LOW.

ARTHUR JAMES BALFOUR is one of the most interesting and attractive actors in the world's great drama, and his career is more suggestive of one of "Ouida's" darling heroes, a mixture of one of Disraeli's political creations, than that of a living English politician. Fifty-four years ago in Scotland, the son of a commoner, although his lineage is older and richer than that of half the peers of the realm, his mother's side connected with the house of Argyll, whose head is his uncle, the Marquis of Argyll, at nine years he was the heir, by the will of his father, to nearly 100,000 acres of land and a great income. Young Balfour was educated at Eton and Trinity College, Cambridge. Neither at Eton nor at Cambridge was he remarkable for scholarship. He left the university in a second class in moral science. At Cambridge he belonged to "Souls," a group of young men who languidly discussed transcendentalism and dabbled in metaphysics. Voltaire, said, with his deplorable flippancy, a magazine writer remarked once, with Mr. Balfour as his model, that when a man talked about what he did not understand to those who did not understand him, that was metaphysics. Voltaire may have been right. One thing is certain. Mr. Balfour, as schoolboy and undergraduate, gave promise of the great things he was to do later. In twenty-six years old, he was elected a member of Parliament.

## EARLY DAYS IN PARLIAMENT.

During the next few years he did little to distinguish himself from the rank and file, still less like any one pick him out as a future prime minister. He was tall and very thin. His face was long and pointed. His manner has been described as lackadaisical. "He had in many respects the whole appearance and manner of the Duke of Devonshire, who has been the butt of the caricaturists and the satirists for two generations," and, like the Duke of Devonshire, of caricature and satire, he found frequent consolation in the use of his pocket handkerchief. In the House he "languidly dozed" on the bench. He was in wretched health, and apparently marked for an early death. His whole manner was that of a man who was deadly bored with life, who lived because he had to, but who wished that the curtain might ring down as quickly as possible. His

manner was contemptuous rather than sneering. He had money, more money than he knew what to do with, but he indulged in no senseless extravagances, and his name was linked with no folly that united him with the mass of mankind. His life was so irreproachable that in sheer desperation he was nicknamed "Miss Balfour" and "Miss Nancy." And yet no one looked upon him as a man devoid of intelligence. Five years after entering Parliament, when he was thirty-one years old, he wrote his first important book, and probably because he was a Cecil born north of the Tweed, it was a polemical work. His "Defense of Philosophic Doubt" is not a book that can be dismissed in a sentence. It showed not only great ability, but it also showed that its writer was a logician and a master of style. Written even by a lesser person than a Conservative member of Parliament connected by ties of blood with the Salisbury family, it would have attracted attention.

## UNDER LORD SALISBURY'S TUTELAGE.

He had been serving his apprenticeship during those years. Either Lord Salisbury had the prescience to divine in his nephew the same qualities that were an inheritance of the common blood, or else it was pure luck that made him his political guardian. Whatever the reason, it was fortunate for both uncle and nephew; and this close connection between Balfour and Lord Salisbury, which began almost immediately after he entered the House, doubtless had much to do with the formation of his character. Lord Salisbury, who at that time held the seals of the Foreign Office, appointed him one of his private secretaries, and in that capacity he accompanied his uncle to the Berlin conference. In 1886, Mr. Balfour was elected Lord Rector of St. Andrews University.

Lord Salisbury went out of office, Mr. Gladstone came in, and in 1884 Lord Salisbury was once more called to the head of affairs. Lord Salisbury was always kind to his relatives; so kind, in fact, that the present cabinet has been dubbed the "Hotel Cecil," because of the numerous members of that powerful family, direct and collateral, who sit at the cabinet board. He made his nephew a privy councillor, which means much; and president of the local government board, which means little. It was quite the

natural thing to do. There was a young man to be provided with a place. It was of no consequence.

#### ADMISSION TO THE CABINET.

Lord Salisbury's lease of power was brief. Mr. Gladstone came back, with an equally brief tenure of office, and 1886 once more found Lord Salisbury prime minister. This time the favorite nephew was made Secretary for Scotland, with a seat in the cabinet. The politicians and the public gasped. It is true that the Secretary for Scotland has little to do; but a seat in the cabinet is the great prize for which all politicians strive, and cabinet portfolios are not flung about at random. Still the country took it good-naturedly. The British public is a tolerant public when it is ruled by an aristocrat. An incompetent more or less, provided he is well-born and respectable, makes little difference. It was during his short incumbency of the Scottish office that Mr. Balfour earned the reputation which clung to him after years of strenuous life. He lay in bed until noon, and received his official callers in a dressing gown. It is said of Lord Salisbury that he has not read a newspaper for thirty years. Mr. Balfour refused to read the newspapers. Friends and foes alike regarded him as a silken sybarite, as a *dilettante* who was too indolent to be great because of his vices, or vicious because of his greatness. He was in wretched health. His bedroom was littered with medicine bottles and pill boxes. About that time he consulted a leading London physician, who told him that what he needed was simply hard work, steady work, work that would keep both mind and body occupied.

#### THE IRISH SECRETARYSHIP.

Now a remarkable thing was done. It was either a flash of genius or else an audacious disregard of consequences that is the very sublimity of genius. Sir Michael Hicks-Beach,—the same Sir Michael who, only a few days ago, announced his purpose to retire from the chancellorship of the exchequer,—had resigned his post as Chief Secretary for Ireland. Those were the days of the Land League. Like his immediate predecessors in that thorny chair, he had been unable to stand the mental and physical strain. His last days in official life were marked by a terrific fight with the Irish members in the House of Commons. Broken down in health, mentally shattered, weary of the thankless task, seeing no possibility of making headway, he sought relief in private life. Lord Salisbury coolly announced to the country that his nephew, Arthur James Balfour, Secretary for Scotland, had been trans-

ferred to the more arduous and much more responsible post of Chief Secretary for Ireland. The public was at first incredulous, then amazed. The Irish members were stunned. The thing was too ridiculous to be believed. Then when they saw that it was true, they set up a howl of derisive delight. If Hicks-Beach, veteran and robust man, had been crushed under the weight of Irish opposition, how much easier would it be to destroy this weakling, who lay in bed until noon, and looked at the world from behind his silken curtains with the *ennui* of a man who has long ago exhausted life?

Ireland had, for some years, been not only the graveyard of the reputations of politicians, but it had brought more than one politician to his grave. W. E. Forster, an honest man, physically rugged and mentally strong, with a great political reputation and a still greater political future, closed his career in the Irish office discredited and disheartened, and was forced into retirement; Lord Frederick Cavendish, a kind and genial man, fell beneath the hand of an assassin; Sir George Trevelyan went to Ireland with black hair, and returned from there, a few months later, with hair turned gray and his face seamed; Sir Michael Hicks-Beach retreated in the face of the enemy, his health broken; and yet, notwithstanding what had happened, apparently the most unsuitable man had been selected to do what other men, in every way better fitted, had found to be impossible. No wonder the Irish howled with delight.

#### A REVELATION OF LATENT POWERS.

There followed a very curious transformation. Mr. Balfour dropped the past like a garment which was out of fashion. Balfour, the *dilettante*, the "silk-skinned sybarite," the *blasé* man, to whom existence itself was only a bore, the anæmic hypochondriac, ceased to exist. In his place there was a Balfour who was robust, vigorous, alert; a man of indomitable will, of great executive force, of such absolute command over himself that he met the most bitter taunts and the foulest abuse with a smile on his face that told nothing. From the moment that he took his seat on the Treasury bench, as Chief Secretary for Ireland, the Irish members exerted all their ingenuity to break him down. There was no word in their extensive vocabulary that was not hurled at him. A "palsied masher," a "perfumed popinjay," a "mollycoddle," were a few of the less opprobrious epithets used when speaking of him. He was taunted, reviled, threatened; every device that ingenuity could suggest was used to goad him into fury; every weapon that malice could invent was employed to wound him. He

**THE RT. HON. ARTHUR JAMES BALFOUR.**

never flinched. If he felt the sting, he never showed it. If his sensitive nature quivered under the agony, no man saw his suffering. He handled himself with such consummate ability, with such admirable *sang froid*, with such superb self-control, that he not only amazed his friends, but he made his enemies marvel. They, like all the rest of the country, were astonished at the miracle that had been wrought. It was David once more confronting Goliath.

#### A FIERY ORDEAL.

Night after night he stood up to his torture. One of two things must happen. Balfour must emerge from the conflict either victor or vanquished. There could be no middle ground. If he failed, his career was ended; but if he won, it would make him a leader of men, and no man could wrest from him leadership. He won. It was the one thing he had needed all his life, the one thing that was to bring out the very best that was in him. Rapidly, so rapidly that old parliamentary hands marveled, he acquired a quickness in debate, a keenness of thrust, a deftness of stroke, a strength of attack, that adversaries feared him. His mind was always logical, always subtle, always philosophical. Those were not qualities, it would seem, that would be effective in a House seething with passion, and yet they were the weapons that turned the illogical arguments of his opponents. Those were the weapons of attack. His weapon of defense, which like a coat of mail covered every vital spot, which left not even the tendon of Achilles exposed, was that cynical, contemptuous, indifferent air; that inscrutable face, that careless manner. And the change physically was as great as it was mentally. The fierce conflict was a positive tonic to him. He became strong and muscular. He was no longer the weakling.

#### QUALITIES OF MR. BALFOUR'S ORATORY.

From the American standpoint, Mr. Balfour is not a great or a pleasing orator. In him the House of Commons manner,—which a cynical observer has termed the worst manner in the world,—is abnormally developed. In America we are accustomed to our public men speaking with a fluency that tells of long training and careful preparation. In the House of Commons men speak with great deliberation because,—as the observer already mentioned has said,—a gentleman is always deliberate, and never in a hurry. The Englishman, when he addresses an audience, punctuates his words with many unnecessary and exasperating “ahs” and “uhs” and “ehs.” Mr. Balfour's favorite attitude in speaking is to grasp the lapels of his coat with both hands. His voice

is strong and penetrating; it is often harsh; and sometimes, when he is vehement, it rises to something like a feminine scream. He is a tall, dark, wiry, muscular man, who dresses well. He no longer “languidly sprawls.” His movements are graceful, without being affected. His speeches do not sound well to the man who has been used to American oratory, because of his provoking interpellations, and because he has a habit of reconstructing his sentences in the middle, but they make fascinating reading. They are models of style; simple, direct, effective; clear cut, convincing, cogent; remorselessly logical, intellectually something more than mere words or phrases. Always one feels that Mr. Balfour is moved by conviction, that he believes in his cause, that he champions it because it is a sacred thing. He once said of himself: “My mind is not made for the exposition of a bill on its first reading.” It tells in a sentence the character of his mind. The man who can explain in detail an elaborate bill, who can go laboriously through every paragraph of an intricate measure, is, usually, a man too matter of fact to be gifted with imagination. It is said that Mr. Gladstone was the one man who could make a budget speech interesting, and that when he brought down the budget, the dulllest and most uninteresting topic to the average member, who was unable to understand the intricate figures, and had still less inclination to do so, the House was crowded to hear the old man eloquent invest such unromantic subjects as income and expenditure with the magic of his voice and the charm of his imagination until they quickened and became sentient things. Mr. Balfour has not this gift. He is best as a debater. In the heat of debate, speaking on the spur of the moment, he is always eloquent, always self-possessed, always ready to seize the vital point. He is bland, sarcastic, polite, but his speeches rarely wound.

#### A MAN WHO NEVER LOST HIS TEMPER.

Lord Salisbury, when a member of the House, was famous for his biting wit. Mr. Balfour can be equally caustic, but is less given to “gibes and flouts and jeers,” as Disraeli said of Lord Salisbury. Mr. Balfour prefers to make an opponent ridiculous by a neat turn rather than to be sarcastically brutal. On one occasion, when the volley of abuse from the Irish benches shocked the House, a Conservative member called an Irish member to order. Mr. Balfour, “languidly sprawling” on the Treasury bench, appeared an indifferent spectator while the power of the Speaker was being invoked, and then, resuming his speech as if there had been no interruption, said to the Conservative member: “Probably

my right honorable friend does not know that the language used by my honorable friend (referring to the Irish member who had abused him) is a term of endearment in his own country." Alluding to William O'Brien and his insatiable desire to always blacken something, he said: "Yesterday it was Lord Spencer's character, to-day it is his boots." It was this imperturbability, this cynicism, which encased him, and which made the bullets of his enemies rebound from his armor like peas fired at a battleship, this total disregard for what any one might say or do or think, that drove his opponents to madness, instead of their plot succeeding to make him rave. "If only he would lose his temper for a single instant," an Irish member once mournfully remarked. But he would not. It was during this time that, dining with Father Healy, he said: "Do the Irish hate me as much as their newspapers say?" "My dear sir," said Healy, "if they hated the devil only half as much as they hate you, my occupation would be gone."

#### PACIFICATOR OF IRELAND.

It is not necessary here to follow in detail his work in Ireland. Uncompromising, unflinching, undeterred, giving to every one of his subordinates the most loyal support, and exacting from them the most loyal obedience and exact compliance with his orders, "In the general opinion of his party," to quote an eulogist, "liberty had been restored to a country previously groaning under the coercion and oppression of a disloyal and illegal organization." Mr. T. P. O'Connor, certainly not a witness prejudiced in Mr. Balfour's favor, admits that he did his work well, even while questioning the efficacy of that work. But that tribute from a political opponent is significant of his power over men. He is no longer detested; on the contrary, as a political opponent wrote of him, "His popularity is at least as great on the Liberal side of the House as on the other." No one can have been brought into contact with him, either as leader of the House or as leader of the opposition, without recognizing the charm of a courteous urbanity which ignores all political differences. Mr. O'Connor also said of him, "His speeches are listened to with pleasure on both sides of the House."

#### CONSERVATIVE LEADER IN THE COMMONS.

For five years Mr. Balfour held his uncomfortable office. On the death of the Rt. Hon. W. H. Smith, he succeeded him as First Lord of the Treasury and leader of the Conservative party in the House of Commons. He had earned his right to leadership, and no one disputed it.

He had pacified Ireland. The old bitterness had passed away. The Irish, always generous to a brave foe, respected him for his courage and his fighting qualities, even if they disapproved his methods. There is nothing more remarkable in this remarkable man's career than to look back those five years and compare the beginning and the end of that period. The contrast is so striking that it almost passes belief. Former foes were now his friends. Abuse had given way to praise. No one now decried his talents or spoke of him with a sneer. They recognized in him a great man, and they saw in him the man who one day should fill the proudest position to which any Englishman not born in a palace may hope to attain,—the virtual ruler of an empire whose flag is in the seven seas. When his party went out of power he was the leader of the opposition; when Lord Rosebery yielded to a hostile majority, Mr. Balfour once more became the government leader, a place which he has surrendered to accept the still more responsible position of first minister. During these years he found the opportunity, in the midst of his distracting parliamentary labors, to write his most important theological work, "The Foundations of Belief."

#### A FRIEND OF AMERICA.

Mr. Balfour has always liked America and the Americans. He has always had many friends among leading men in this country, to whom he has extended graceful hospitality in London. Americans may feel sure that as premier he will do nothing to disturb the cordial relations that now exist between the two countries. Mr. Balfour has already given pledge of that. Prior to the outbreak of the Spanish war he was acting Secretary of State for Foreign Affairs, the condition of Lord Salisbury's health compelling him to take a vacation in France. It was while Mr. Balfour was in charge of the Foreign Office that France and Austria attempted to form a European coalition against the United States, in which the other powers of Europe stood ready to join if Great Britain would also become a member of the league. Mr. Balfour, without hesitation, not only declined the offer, but, on the contrary, let it be known that in case of hostile action on the part of Europe, Great Britain would be found supporting the cause of the United States. That ended the attempt to form a coalition. Probably because of his pro-Americanism, Mr. Balfour was at one time a strong bimetalist.

#### ART LOVER, LITTERATEUR, SPORTSMAN, AND SOCIAL FAVORITE.

He has developed into a most attractive personality. He is to-day the man most in demand

in London; and he is as popular with men as with women, with men of his own party and with men who face him across the aisle. To him the word "brilliant" properly applies. He is a many-sided man. An accomplished musician and passionately fond of music, in the days when the House was his purgatory, after adjournment, he hurried to Bayreuth to saturate his soul in Wagner and forget such trifling annoyances as Irish debates; a lover of art and the possessor of the largest private collection of Burne-Jones' works; a golfer who has been captain of that most famous organization, the Royal and Ancient Golf Club of St. Andrews, as well as the author of a treatise on golf; a cyclist, and the president of the National Cyclists' Union; a writer of books, and the reader of the best literature; an automobilist, and his own chauffeur; a brilliant conversationalist; a man so engaging that men perforce must be his friends; rich and well-born, it is not to be wondered at that he has been courted and flattered, that more than one woman has tried to bring him to her feet. But Mr. Balfour has resisted all snares. He is a bachelor, but not a woman hater. His house in London is presided over by an unmarried sister.

#### MR. BALFOUR'S HOME IN SCOTLAND.

Whittinghame, Mr. Balfour's magnificent estate in East Lothian, Scotland, has a romantic history attached to it. Whittinghame Castle was, according to tradition, given by the ill-fated Mary Queen of Scots to the Duke of Douglas, and it was there that Bothwell planned the murder of Darnley. The old castle is in ruins. The present residence was built by Mr. Balfour's grandfather. It is a very beautiful place, and is

in the heart of some of the most picturesque scenery in the south of Scotland. On one side are the wooded banks of the Firth of Forth; on the other, the romantic country made dear to all readers of the "Bride of Lammermoor."

#### TO BE THE REAL HEAD OF THE GOVERNMENT.

It is never safe to prophesy, and it is especially unsafe to prophesy about so uncertain a thing as politics; but if one were so rash as to venture a prediction, it would be that Mr. Balfour, as prime minister, will be the leader of his party in fact as well as in name. He may transfer Mr. Chamberlain to the treasury; he may direct affairs from the quieter atmosphere of the House of Lords; but whether he remains in the Commons as First Lord of the Treasury, or goes to the Lords as Lord Privy Seal, his hand will hold the helm, and he will keep an especially watchful eye on his first lieutenant, the Rt. Hon. Joseph Chamberlain. For although Mr. Balfour is an aristocrat to his finger tips and a democrat at heart,—a strange mixture, but there has always been a contradictory streak in all the members of the race of Cecil,—he, like the rest of his party, has no love for Mr. Chamberlain. Mr. Chamberlain may be prime minister of Great Britain,—things much more strange than that have happened,—but Mr. Chamberlain will not have his darling ambition gratified so long as the house of Salisbury is powerful enough to prevent it. In other words, the day that Mr. Chamberlain comes into power will mark the decadence of the Salisbury influence in British politics. And with Mr. Balfour at the head of affairs,—vigorous, alert, able,—that day is not likely to be near at hand.

WHITTINGHAME HOUSE, MR. BALFOUR'S EAST LOTHIAN HOME.

# SPOONER OF WISCONSIN.

## A SKETCH OF THE PRESENT LEADER OF THE SENATE.

BY WALTER WELLMAN.

**S**ENATOR SPOONER is now looked upon as the most brilliant man in Congress. This appears to be the judgment of the country, and it certainly is the opinion held at Washington. The country's estimate of a public man may not agree with the Washington estimate. When they conflict, Washington is usually much nearer the mark. Washington is not a hero-worshiper. It is coldly critical; it studies at close range; it is behind the scenes. The country, on the other hand, is the audience which sits in front, and watches the performance upon the stage. There may be, and sometimes is, a glamour in its eyes; it sees an illusion rather than the man himself. It is comparatively easy to deceive the country. One good speech, spoken at the lucky moment, containing a few phrases which catch the popular fancy, may do it. But it is almost impossible to deceive Washington. In a sense, we at the national capital are all mental valets to the great men who assemble here, and if they win our respect and admiration, they must well deserve it.

The United States Senate has been called the greatest legislative body in the world. Probably it is. If it has a rival, it will be found in the House of Commons. As the Commons dominates the legislation and policies of the kingdom, so the Senate dominates the governmental activities of the Republic. The man who rises to the first rank in a body like the Senate is a man of power. Only ten or a dozen of fourscore and a half form that select company. There are no weaklings among them. Accident or wealth may get a man into the Senate, but it will not get him into the inner circle. He who not only obtains entrance to this managing and leading coterie, but who comes to be recognized as the most brilliant, most useful, most powerful member of it, must have something in him which rises very nearly to the height of genius. It places him next to the President of the United States himself in actual potentiality in our government; and winning this station may be a greater credit to his intellectuality and character than the Presidency itself. Accident may take a man into the White House, but it cannot put him where John Coit Spooner stands to-day. In estimating the true meaning of this high place, we must remember that the Senate comes nearer to being the government of the United States

than any other part of the system. Of late years it has completely eclipsed the House of Representatives. To the President it is a sort of council of state,—a council which molds him much more than he molds it. The Senate is largely

SENATOR JOHN C. SPOONER, OF WISCONSIN.

controlled by this inner circle of a dozen men. Actual personal leadership it will not have. According to the ethics and traditions of that body, no man may aspire to such commanding influence in it as Speakers have wielded or chairmen of ways and means committees have enjoyed in the House. The Senate will recognize no captain, not even the President of the United States. It is a stickler for the theory of equality. Presumably one Senator is as good as another. But in practice there is the dominating inner circle; and, when one thinks of that circle, the first man who comes to mind is Spooner, of Wisconsin. This brings him as near to the leadership of the Senate as any man may hope to get.

Influence in the Senate is acquired in many

ways. The popular impression appears to be that it is best won by making speeches. But that is not the case. Ability to talk well, to hold one's own in debate, is a desirable accomplishment. But it is not essential. Some of the most influential men in the Senate do not speak at all, or but rarely. Some of the best and most prolific talkers have little influence. The man who acquires a place of power in the Senate must possess, above all things, a cultivated mind, clear judgment, willingness to study, work and think, unselfishness, good feeling, the happy knack of being firm and even insistent without rousing personal antagonisms. There are few Senators who have all these qualities. The bane of the Senate, as it is the bane of all public careers at Washington, is the dominance of small things. Too many public men permit their constituents to make messenger boys of them. Their energies are frittered away in a constant vigil with pension bills, claims, office-hunting, and correspondence thereabout. Here and there is a Senator who frees himself from this thralldom of the little and gives his energies to real statesmanship. He studies big things. Of the comparatively small number of Senators who have thus broadened their horizon, Mr. Spooner is easily the most conspicuous. A large measure of his success is due to the fact that he rarely uses his energy or capitalizes his influence in the pursuit of trifles.

#### A PRACTICAL LEGISLATOR OF THE BEST TYPE.

In Congress, as everywhere, the tendency is toward specialization. Senators take up one line or another, become as proficient as possible in that, and give very little attention to other subjects. Mr. Spooner has never been a specialist. He has carefully avoided identifying himself with any particular topic or question. He is an "all-around" man. Everything of importance is his specialty. He is so willing to work, so eager to investigate, so tireless and so alert, and his sincerity and judgment are so highly valued, that all the specialists consult him. He is a sort of consultation doctor for all the legislative practitioners. It does not matter what it is,—Cuba, the Philippines, Porto Rico, our colonial policy in general, the Isthmian canal, war-tax reduction, finance, the tariff,—every chairman of committee who has an important measure to take in on the floor seeks the advice of the Senator from Wisconsin before doing so. As a lawyer and maker of laws, as a watchdog against the furtive slipping in of blunders, as a suggester of stronger and better methods, as a deviser of practical schemes which will meet existing conditions in the Senate and the country, he is without a peer

in public life. The natural result, — despite himself, and not at all through his seeking, — is that his finger is felt in nearly every big legislative pie. His impress is more or less upon every policy, every great act. Sometimes his work is known to the country, as in his happy solution of the Isthmian canal problem, but oftener it is not. He cares not who gets the credit, so the work is done, and done right. The writer could name half a dozen important provisions of law which were placed upon the scroll by Spooner, not one of which was he ever known, outside the Senate chamber, to have had any connection with.

#### THE MOST ENCYCLOPEDIA OF THEM ALL.

It follows, as a matter of course, that such a man is much sought; that other Senators are constantly running to him with their knotty problems; that to him come many opportunities to give his country the benefit of his talents. It follows, too, that he gains the respect and confidence of his associates. They find him unselfish, willing to help without demanding a price, and they trust him. They find his insight well-nigh infallible, and so they not only seek his advice, but accept and follow it. The range of his activity bespeaks the culture and the character of the man. When Mr. Foraker was to the fore with his Porto Rican government bill in the last Congress, he was glad to seek Mr. Spooner's aid. So with Senator Cullom, with his measure making a Territory of Hawaii. When Mr. Lodge was preparing his important measure establishing a civil government in the Philippines, Mr. Spooner was one of his most frequent counsellors. Thus it was also with Mr. Hanna, in his now famous campaign for the Isthmian canal. During his long and arduous struggle with the problem of Cuban reciprocity, Mr. Platt, of Connecticut, leaned heavily upon the arm of his friend from Wisconsin. There is no need to multiply instances. It is within bounds to say that no important measure reaches the statute-books, or even the calendar of the Senate, without having the hallmark of the active and sympathetic mind of Mr. Spooner stamped upon it in greater or less degree. He is not, of course, the only Senator who is thus industrious and valuable in council. There are others, — like Allison, Platt, of Connecticut; Hale, Aldrich, Frye, Hanna, McMillan, Cullom, Burrows, Foraker, Fairbanks, Beveridge, Proctor, Elkins, — whose opinions are often sought. But, to some extent, each of these is more or less a specialist. Each is authority upon certain subjects in line with his training or bent. In the Senate, there is general recognition of the fact that Spooner is the broadest, the most cyclopedic of them all.

If we now add that Mr. Spooner's counsel is as eagerly sought at the White House as it is in the Senate, and as often accepted, we shall begin to understand the unique position which the Wisconsin Senator holds in the American Government. While Mr. McKinley was President, few weeks passed in which Mr. Spooner was not asked to the White House for consultation. Throughout the trying days which immediately preceded the outbreak of the war with Spain, Mr. Spooner was one of the three or four advisers upon whom the hard-pressed President most eagerly leaned. Two or three of the scenes in the cabinet room at these evening conferences upon the weighty question of war or peace were of a dramatic character, and the manner in which Mr. Spooner demonstrated his moral courage and patriotism on at least one occasion will be worth a special chapter as soon as it shall be proper to publish the inside history of that period. Three Presidents of the United States,—Harrison, McKinley, and Roosevelt,—urged Mr. Spooner to accept places in their cabinets.

#### A GREAT DEBATER.

As Mr. Spooner is strong and wise in council, so is he admirable in debate. It falls to the lot of few public men in America to shine in both fields of public activity,—first as framer of policies, and next as interpreter of them. There are a number of men in Congress who give the country excellent service in one or the other; among the very few who are successful in both, Mr. Spooner stands out preëminent. He is easily the first debater of the American Congress of our time. He is the recognized spokesman of the Republican side of the chamber. Sometimes he is the chosen representative in the Senate of the administration. This does not mean that when he speaks for his party he descends to the level of unblushing partisanship; nor does it mean that when he speaks for the administration he makes himself a mere mouthpiece. Into all his work he throws his individuality,—a characteristic vigor of thought and expression, an interpretation breathing his own practical, optimistic, typical American philosophy. He seems the boldest of the bold; but a vein of caution runs through everything he says. He upheld the Government in its efforts to assert American sovereignty in the Philippines, but he has never declared for eternal retention of that sovereignty. He upheld the doctrine of the free hand in dealing with conquered or acquired territory, without the hard-and-fast restrictions which the Constitution might impose if it must always accompany the flag, but he is opposed to making States of any of the non-contiguous territories.

In debate, Mr. Spooner well justifies the cognomen which has been given him, "The Little Giant." Small of stature, his ideas are large. He shows himself always a man who lives amid big questions and is at home there. That he is a debater rather than an orator appears from the fact that, unless he can stir the opposition to interruption and retort, he is not at his best. He deems himself luckiest when Senators on the other side of the chamber get up and go at him. It is when his steel strikes flint that the sparks fly most merrily. He is not content with sharp repartee, with witty or crushing rejoinder, though in these he is adept. Criticism inspires him to his loftiest flights. A case in point was near the last hour of the recent session, when unexpectedly a Philippine discussion was precipitated by the Democratic Senators. On the spur of the moment, Mr. Spooner was put forward to answer them. His answer rang true. It is believed to be the best thing he ever did. He completely silenced the guns of the opposition in a short speech which for years to come will stand as a model of that sort of debate.

Senator Spooner does not need to write out his speeches, and never does so. All his life is spent in preparation for meeting any emergency that may arise. He is always ready. He is the full man, who can tap himself at will. When he has a set speech to deliver, he gathers data, revolves it all in his mind, thinks out the order in which he will bring forward the various points, makes a few notes, and then forgets to refer to them. But the spring of his intellect never fails him. From it runs always a stream, clear and fresh. His English is simple, luminous, forcible. As he speaks it, so it is printed in the official "Record," with little or no revision. Three or four of the most noteworthy speeches heard in Congress in recent years have fallen from the lips of Mr. Spooner, and upon as many topics.

#### HOW SPOONER WON THE DAY FOR PANAMA.

One notable example of Mr. Spooner's skill as a legislative architect is found in the Isthmian canal bill which bears his name. A number of eminent and successful public men have said that they should want carved upon their tombstones no prouder epitaph than "Author of the Isthmian Canal Bill." That plan was an inspiration which came to Spooner's mind, he says, one day while he was riding to the capitol in a street car. He saw at a glance how he could devise what would appear like a compromise, and yet would not be one; how he could meet conditions as they existed in the Senate and secure results; how he could induce the Congress to declare for the superior route first and the in-

ferior route next, at the same time placing in the hands of the President a club which would the more surely enable him to get the necessary concessions for the preferable project on fair terms. Senator Hanna has admitted that, but for Mr. Spooner's inspiration, the Panama route could not have won the victory.

#### HIS LIFE RECORD.

John Coit Spooner is a native of Indiana, where he was born January 6, 1843. While yet a lad, he removed, with his father's family, to Madison, Wis. He graduated from Wisconsin State University in 1864. Young Spooner entered the Civil War as a private soldier, served as captain, and was brevetted major. When twenty-four years old he was admitted to the bar, where he practiced for many years with notable success. He was for some time assistant attorney-general of the State, and in March, 1885, took his seat in the United States Senate. During his first term he attracted little attention, making but one notable speech. At the end of

that term he was succeeded by William F. Vilas, the Democrats having captured the Legislature. Mr. Spooner, however, received the full vote of the Republican legislators. In 1892, "the Cleveland year," he ran for governor, but was defeated. In 1897, he was elected to succeed Mr. Vilas in the Senate.

Senator Spooner is intensely devoted to his family; and, two years ago, Mrs. Spooner's health being threatened, and the climate of Washington not being good for her, the Senator wrote a letter declining reelection. This letter has given rise to political complications in his State, and even now his return to the Senate is not assured. Mrs. Spooner's health has greatly improved, and there is a great demand throughout the country that he be reelected.

Mr. Spooner is not yet sixty. He looks even younger. Vigorous in mind and body, virtually in his prime, admired and trusted, not ambitious, useful, a truly national figure and a national servant of the highest type, he should keep his place in the Senate for many years to come.

## THE GEORGIA GOVERNORSHIP.

ON June 7, the Georgia "primaries" were held. These primary elections are nothing more than the choosing by counties,—and by the white vote alone,—of delegates to the nominating convention, which is held a week later, and at which the nominees for the governor's seat and for other State offices are named. That all the candidates who have any showing in Georgia are Democrats goes without saying, as there is practically but one party in the State. From a group of contestants a single nominee is always selected, and the others immediately retire with good grace and unshaken loyalty to the old party. It is easily seen that when the delegates to this convention are named, which is done in the primaries, the governor is practically elected. Therefore, the Georgia primaries on June 7 settled the gubernatorial election matter in that State, the nominating convention on July 2 confirming the result. The Hon. Joseph M. Terrell has practically won his campaign for the governor's seat.

There were several popular candidates before the people. Indeed, in these Southern contests it is usually so. There can generally be counted the ubiquitous "editor in politics," who draws a strong newspaper following; the "plain farmer," who banks heavily on the rural vote; the temperance or general reform advocate, leaning upon the moral sentiment of the people at large;

HON. JOSEPH M. TERRELL.

(Democratic candidate for governor of Georgia.)

the lawyer who has in the past administered some public office with approval; and, after these, perhaps, a politician or two, pure and simple. One, at least, of these will also have served in the

Confederate army, and the ballots of the veterans will go his way.

The recent group of aspirants for the governorship in Georgia was composed of very nearly these elements, and public favor was, therefore, greatly divided. But the two most conspicuous of the five contestants in the struggle proved to be Mr. Terrell, the successful man, and, after him, the Hon. J. H. Estill, of Savannah.

Colonel Estill was the "editor in politics" as well as the one-time Confederate soldier,—a

COL. J. H. ESTILL.

combination hard to beat, especially when, as in this case, the reputation established both in the field and in the sanctum was unassailable. He was scarcely of age when the Civil War broke out, but he immediately offered his services, and throughout the long conflict proved a worthy son of his native land. When the struggle ended, he came home impoverished, like most of his fellows, and began life anew. That he was able in a few years to achieve a competency, becoming, first, part owner, then editor and manager, later, editor and sole proprietor, of a paper so strong and important as the *Savannah Morning News*, proves him the possessor of both administrative and journalistic ability. He is very prominent, also, in other ways in his native

city, Savannah, being county commissioner, an influential member of the board of education, and chairman of the finance committee. Besides all this, his personal character is without reproach, and this has magnified his influence.

Colonel Estill's announcement of his candidacy was in itself refreshingly frank and simple. He opened with this ingenuous statement: "In compliance with the wishes of my friends and my own ambition to occupy that most honorable office, I have decided to be a candidate for the Democratic nomination for governor." Having kept himself free from political entanglements in the past, he talked no political jargon. "I have no platform," he declared, "nor do I think I shall promulgate one. The constitution and the laws are the platform on which the chief executive stands." Altogether, this editor in politics made a most interesting figure, and it was rather through the exceeding strength of his chief opponent than through anything that could be called weakness in himself or his campaign that he happened to come out second in the race.

This chief opponent, and now victor, the Hon. Joseph M. Terrell, has administered for the past ten years the office of attorney-general of Georgia, having only recently resigned this honorable position to enter the contest for the governorship. Mr. Terrell is still a young man, having celebrated his forty-first birth-anniversary on the fortunate day of the primaries. A Georgian of Georgians he is, like the now eminent Democratic leader, Congressman Griggs, Mr. Terrell's old schoolmate and friend. Both these strenuous young men are of the old pioneer stock from which statesmen have many a time been fashioned, have had their education in the common schools of the State, and their life-discipline in every-day paths of duty; both read law early, and became youthful practitioners in small Georgia towns, whence one has climbed to a seat of distinction in Congress and the other to the governor's chair at home.

When Mr. Terrell's hand shall grasp the helm of this important Southern State, two things besides the judicious discharge of a governor's ordinary duties are, by the clear record of his past, well-assured—one, that the new educational movement in that State, the placing of her common schools upon a broader, sounder basis and the promotion of industrial and technical training, will be fostered and urged forward; the other, that the new manufacturing movement will meet with no check or hindrance which the governor can possibly remove. Every Southern State needs at this turn a governor of Mr. Terrell's stamp.

THE "THOMAS W. LAWSON," LAUNCHED AT QUINCY, MASS., JULY 10, 1902.

## A SEVEN-MASTED SCHOONER LAUNCHED.

### THE LARGEST SAILING SHIP AFLOAT.

**I**N the same month, July, in which the New York arsenal completed for American coast defense the most powerful cannon ever built, the Fore River Ship and Engine Company launched at Quincy, Mass., the biggest sailing vessel that floats. The ship was all the more significant from the fact that it was a type totally new to the world, a seven-masted schooner. Two or three years ago a five-masted schooner was one of the marine wonders, two only being in existence. The seven-masted *Thomas W. Lawson*, launched on July 10, is not only a notable innovation from her size and her rig; the steel construction throughout and the use of steam power instead of man power marks the final departure from the old-fashioned wooden-timbered craft of the Maine shipyards. Even the masts of the *Lawson*, except the topmasts, are of steel; and so thoroughly are the six powerful steam engines adapted to the requirements of shifting

the sails and spars and lowering and raising the anchors and steering, that sixteen men only are a sufficient crew.

The hull of the *Lawson* is 403 feet long, with the steel bowsprit extending 83 feet farther, and has a beam of 50 feet. She carries 8,100 tons of cargo, and has a total displacement when loaded of 11,000 tons. The masts tower 150 feet above the deck, and carry 25 separate sails. Such a modern freighting schooner is fitted with conveniences that would seem luxurious indeed to the able seaman of a generation ago. Electric lights are everywhere that lights are needed, steam heats the cabins and works the pumps and the siren, while telephone lines connect the navigating departments with the engine room.

The *Lawson* will be used as a collier in the coasting trade at first, and her owners expect her to make a good profit on the cost of a quarter million dollars. Later she may go to the Pacific Ocean.

## THE NEW GUN THAT SHOOTS TWENTY-ONE MILES.

**T**HE 16-inch breech-loading rifle just built at the Watervliet Arsenal for the defense of New York Harbor marks an epoch in the whole history of artillery warfare. The great cannon is half again more powerful than its nearest rival,—an English gun of 16.25-inch bore. It is one of a series of coast-defense guns provided for by the Endicott Board, appointed during Cleveland's first administration. Eighteen such rifles are to be mounted for the defense of New York City, ten for San Francisco, eight for Boston, and four for Hampton Roads.

Guns of larger caliber are in use in other countries; there is an Italian 17.76-inch rifle, a French gun of 16.5-inch caliber, and the Armstrong gun on the British battleships measures 16.25 inches. But the maximum energy of the new American gun is 88,000 foot tons, as against 45 per cent., 41 per cent., and 65 per cent. of

this energy for the Italian, French, and English giants, respectively.

The most dramatic feature of the American rifle is its range. The greatest actual performance in long-range shooting is that of the Krupp gun, fired before the Kaiser in April, 1892, which carried about twelve and one-half miles. The new American rifle will have, theoretically, the amazing range of twenty-one miles. In other words, a warship carrying such a rifle could anchor in New York Harbor and throw projectiles into New Rochelle, or Paterson, or Hightstown. In the course of its flight the shell would rise about six miles above the ground.

The monster gun is 49 feet 2.9 inches long, the projectile is 5 feet 4 inches long, with steel penetration of 42.3 inches. The cost of firing one shot is about \$1,000, and the weight of the rifle without the carriage is 126 tons.

THE NEW SIXTEEN-INCH GUN JUST COMPLETED AT WATERVLIET ARSENAL.

THE BLOCH MUSEUM OF PEACE AND WAR AT LUCERNE.

## M. BLOCH'S GREAT WAR MUSEUM AT LUCERNE.

**J**EAN DE BLOCH being dead yet speaketh to the world, and will continue to speak through the Museum of War and Peace which he has created on the shores of the Lake of Lucerne, and which was opened on Saturday, June 7, by M. Passy in the presence of an assembly of the friends of peace of all nations. The distinguished founder, whose marble bust, surrounded with laurels, stands in the great hall of the museum, was represented by his son, M. Henri de Bloch, his widow, Madame de Bloch, and her two daughters, the Countess Koscielska, whose husband is a conspicuous figure among the Polish members of the Prussian Herrenhaus, and her widowed sister, Madame Holynska. One of their guests made the remark, that the late benefactor had after his death added to the benefits he had conferred upon the world by making the members of his brilliant and accomplished family better known to the leaders of Western thought and progress. To this may be added the further observation that he has still further increased the debt which we owe him by reminding us of the continued and indestructible existence of the Poles among the family of nations.

A Russian chronicler once bitterly complained that for centuries Russia was hidden from the eyes of mankind behind the two menacing specters, the Pole and the Tartar, which enveloped her on the West and on the East. The same remark, with variations, may be made about Poland to-day. The nation which formerly obscured Russia from the sight of the West has, for

more than a hundred years, disappeared between Russia and Prussia. The busy nations on the seaboard had almost forgotten the existence of their Polish sister. Since the days when "Freedom shrieked when Kosciusko fell" few Polish names have imprinted themselves upon the Western mind. But the Poles, although overlooked, persisted in existing, in cherishing their faith, in pursuing their national culture. Cut off by their partition from the possibility of exercising any influence as a political state, they threw themselves into other pursuits. They made their provinces the most prosperous region in Russia. They thrived so much in Posen that the Kaiser and his Chancellor have emitted cries of alarm, the one over the fecundity of the Polish "rabbits," while the other proclaims that "Polish arrogance is resolved to encroach upon Germanism." In Austria they have shown their capacity to govern the semi-autonomous province of Galicia. But the dim myriads of peasants and artisans, of merchants and manufacturers, might have existed for generations without making any impress upon the imagination of the world if no man had arisen capable of shivering the gloom with the lightning of his genius.

Such a man Poland at last produced in Jean de Bloch. At a time when another Polish genius, Sienkiewicz, was emulating Sir Walter Scott in reviving the almost-forgotten romance of his country's past, Jean de Bloch arose to compel the recognition by the world of the great and luminous idea by which he was able to cast a

gleam of hope and inspiration upon the somewhat somber horizon of the future. Sienkiewicz reproduced the past, but Jean de Bloch incarnated the present, and foresaw the future. In him the world saw Poland once more a living, healthy, thinking, inspiring force in the circle of the nations.

Jean de Bloch was a seer, a seeing man in the midst of the blind. He saw that we had passed through a period in which, almost unconsciously, such a revolution had been effected in the methods of warfare as to render war on a large scale practically impossible. He saw the truth, and proclaimed it abroad in the hearing of the world. At first his message fell upon deaf ears. His zeal was redoubled by the indifference of the unseeing multitude. He wrote, he spoke, he spared neither time nor expense in order to drive conviction into the minds of his contemporaries. At last he found a hearing. Some dim perception of his great discovery dawned upon at least one master of many legions. Then came the Hague Conference, and M. de Bloch found in that international parliament an admirable field for the preaching of his message. After the Conference came the war, which went so far to verify all M. de Bloch's contentions that it was no paradox to say that Mr. Chamberlain's name may live in history solely because he was the author of a war which verified the hypotheses of M. de Bloch.

To embody in a great museum a permanent, visible, and tangible object-lesson, M. de Bloch set on foot during the late war the foundation of a great Museum of War and Peace, which would embody and illustrate the truth which he sought to teach. Unfortunately, death smote him before he was permitted to see the fruit of his labor. His place was taken by his son, who completed the work which his father had begun. Hence it was possible for M. Passy, on June 7, to open the picturesque building which has been reared on the shore of the Lake of the Four Cantons to provide house-room and exhibition-space for the contents of M. de Bloch's museum.

The interior of the museum is in a state which is at once very finished and very unfinished. The building, being a temporary one, to be reconstructed in six years, is a series of vast sheds, some divided into compartments, each of which is devoted to a different country or a different age. The floors are not yet paved, and nothing in the way of permanent decoration has been attempted. On the other hand, the collection of exhibits,—and that is the chief thing,—is very complete, very interesting, and very varied. In the large entrance hall the first thing that strikes the eye is a bust of the late M. de Bloch, surrounded with palms and flowers, and looking out upon the vast collection of arms which he had

THE LATE M. JEAN DE BLOCH.

collected from all parts of the world. The room, indeed, contains specimens of every weapon employed by man since he first took to slaying his brother with flint arrow-heads. There are two very remarkable-looking hooped brass cannon, cast in the fifteenth century, a bristling little forest of Swiss pikes with which the herdsmen and burghers of Switzerland destroyed the chivalry of Austria, suits of armor from the Middle Ages, rockets used in 1870, Maxim guns of the latest type, targets showing the effect of bullets and shells fired at various ranges,—everything, indeed, directly or indirectly connected with armaments new and old is to be found here. This is the mechanical side of war. The pictorial side is even better shown in the gallery of dioramas, the entrance of which is behind M. de Bloch's bust. The tableaux here are about eight in number; and they are admirably painted by scenic artists of repute, the foregrounds being skillfully built up of real objects. Here the tactical methods of the wars of the past and present are contrasted, the difference in formation being clearly shown. The Swiss defending their mountain passes, the Russians attacking Plevna in the snow, the British methods of attack in South Africa, are all admirably put together, and the tableau of a battlefield by night is worthy of Verestchagin.

But these two rooms take up only a small por-

tion of the museum. The mechanism, science, art, and statistics of war are shown in equal detail in a number of other rooms and galleries. The collection of models of battlefields is very large, and very scientifically arranged. Several compartments of the room in which these are contained are devoted to tactics and strategy, and the visitor can examine the methods of Alexander and Caesar within a few paces of diagrams and models showing the methods employed in South Africa. In another room may be read on the walls the text of important international treaties, a useful and instructive lesson of the futility of the policy of "Never again" in the days gone by. Running out of this room,

MADAME DE BLOCH.

and ending on the other side of the entrance hall, is a long gallery divided into compartments. In one may be seen depicted pictorially and by means of models "Fortress Warfare in Ancient and Modern Times;" in the next is a collection of human and animal relics of the battlefields, in the shape of skulls and skeletons. To show the various types of injuries to the bone inflicted by bullets at different ranges is the chief object of this collection; a horse's skeleton bears testimony to the extreme difference in the character of wounds which results from a change of range. There is a section devoted to naval warfare, with pictures of ancient and modern ships, the strength of navies of different powers, and the naval budgets of Europe and America being shown by means of diagrams. Finally, there is a good-sized

M. HENRI DE BLOCH AND HIS SISTER, MADAME HOLYNSKA.

auditorium, where it is proposed to give lectures with the cinematograph on all subjects of interest to those engaged in the study of the problems of modern war. A library of war and peace will also be established.

But this does not exhaust the interest of the museum. The grounds at the back and sides of the building are devoted to displaying some of the mechanism of war on a full scale. There are sections of trenches of various types, open, covered in, and protected from assault by those terrible wire networks which the late M. de Bloch loved to insist upon as one of the strongest weapons of modern defense. And, finally, there are short sections of various types of military bridging material.

Altogether the museum is very complete and very interesting. It is not too technical to puzzle the casual visitor, while it is scientific enough to satisfy the serious military student. Controversial matters are kept in the background,—facts, as the late M. de Bloch used to insist, being the best of arguments. The best evidence of the combined popular and scientific character of the museum is that, while it was founded by the energy and initiative of a civilian, its board of management contains several military names of distinction. The union of two, too often inimical, classes in the cause of peace is a good omen for the future of the museum, and certainly nothing has been left undone to make the whole institution as attractive as it is instructive.

HARVEST SCENE ON A TEXAS RICE FARM.

## THE NEW RICE-FARMING IN THE SOUTH.

BY DAY ALLEN WILLEY.

THE story of the "rice belt," which extends four hundred miles through southern and central Louisiana and southeastern Texas, from the banks of the Mississippi to beyond the Brazos River, varying in width from twenty to fifty miles, is not unlike the story of wheat-growing Kansas. Here also is the prairie, with its scrubby vegetation which pastured the few herds of cattle and ponies owned by the natives, who little realized its possibilities. In fact, the great natural reservoir which lies beneath was only discovered by accident, after the pioneer Western settlers, by some freak of fortune, had ventured into the country, determined to discover what elements of wealth lay beneath the sod. Quick to perceive that the rice plant flourished even with the crude and scanty cultivation it received, they abandoned the intention of raising other grains, but applied methods to which they were accustomed in preparing the soil, seeding, and nurturing. Water they collected in reservoirs dug with plough and shovel. Their efforts were rewarded by harvests so abundant as to repay them in spite of the frequent failure of the reservoirs and the loss of a year's work by drought. The method of irrigation was changed; the native growers emulated their example, and discarded the primitive modes they had followed. The magnet of success attracted settlers not only from the middle West, but from far-away New England and New York, and even the hardy Swede and Norwegian from Minnesota. Just as clusters of cabins in Kansas

and Nebraska have become towns and cities, and tract after tract of range land has been converted into an island sea of waving grain by the tide of humanity flowing out upon the plains from the East, so this Southern soil has been taken up and is being changed from one of the great waste places of the continent into a center of productivity.

### THE IRRIGATION PROBLEM.

Since the pioneers in this movement located in the belt eighteen years ago, 350,000 acres have been reclaimed for rice culture, and 50,000 acres yearly are being added,—not extensive when contrasted with the wheat and corn fields, but representing, acre for acre, far greater outlay in money and effort, for every square foot must be irrigated during the growing season, necessitating a network of canals aggregating fully 1,200 miles, to say nothing of the labor involved in walling the fields to hold the water, all of which the wheat or corn planter avoids. To go further into statistics, the 30,000 rice growers have invested \$20,000,000, represented by their lands, canals, and machinery; yet their operations have been confined to a few corners of the land believed to be productive. The statistician has estimated that 4,000,000 acres have a natural supply of water to be obtained by piercing the earth's crust to the reservoir beneath or from the streams intersecting the country. The area under cultivation already yields 2,000,000 barrels, re-

A TYPICAL PUMPING STATION TAKING WATER FROM WELLS AND STREAMS AND ELEVATING IT TO THE HEAD OF THE CANALS.

quiring 10,000 cars to transport it to market. It supplies two-thirds of the quantity consumed in the United States.

#### THE MODERN PROCESS OF RICE GROWING.

Modern ideas and systematic methods attend the culture of the grain from seedtime until it leaves the field to be sorted and prepared for the market. The grower may till 50 or 5,000 acres; but about each tract the bank of earth is carefully thrown up by the ditching plough, frequently "tamped" on the inside with spade and shovel to prevent leakage. The horse drill and cultivator can be used in seeding, while furrows are turned as in an ordinary field intended for wheat or oats. Water flows upon the shoots when a few inches out of ground, and until harvest time in early autumn the country is turned into a series of lakes, for the plant roots must be continuously submerged, three or perhaps four months, to a depth of two or three inches.

Every acre is a great sponge absorbing 14,000 to 15,000 gallons every 24 hours, yet when the grain nears maturity, and the water is drained from it, evaporation is so rapid that the farming machines can pass over the fields without difficulty in a few days. Then the scene is strikingly typical of harvest time in Kansas or the Dakotas. No less than 5,000 harvesters, actually doing the work of 200,000 men, sweep through the mile after mile of golden stalks, for by a few alterations the mechanism which cuts and binds the sheaves of wheat ready for the stack without human aid has come to the assistance of the rice growers. The steam thresher following converts the chaff and straw into mammoth stacks, pouring the white kernels into a hundred bags in a day.

The tendency toward economical and intensive farming is everywhere apparent,—it is not how great an area can be cultivated, but how much it can be made to yield. A study of the methods

Is one of the secrets of the remarkable success attained by these men who have ventured in unknown territory to engage in an equally new means of securing a livelihood. Necessitated by experience, some of it bitter in the end, taught them to husband their time and money. They studied every source of expense to gain if it could not be reduced. They did confine their investigation to the farming expenses alone. Realizing the outlay for transportation and commission in sending the rice to market to be prepared for market, they built in sight of the fields which clean, polish, separate the cereal into its marketable grades. The greatest economic factor is this wonder-borehole, which, scientists say, contains water supply that cannot fail. These "waters of the earth" are held in gravel strata having a bed of hard clay, which the well-borer's drill reaches at distances ranging from 100 to 200 feet below the surface. To fill the canals from the well stream one of the most extensive pumping systems in the world has been constructed,—pumps distributed throughout the district. A single station filling one of the larger canals can serve the needs of a city, as it lifts 60,000

to 75,000 gallons a minute the 30 feet or 40 feet to the conduit level. The canals reaching the larger rice fields range from 20 to 30 miles in length, sustaining a volume of water 100 feet in width and five to six feet in depth. From the main or feed channels are excavated branches which connect directly with the fields. Wooden aqueducts or flumes are extensively employed to carry the water across valleys and for waterways at the source of supply in order to give sufficient elevation to create a rapid current. During the flooding season these arteries of nourishment enhance the artistic effect of what is in truth an attractive landscape, gleaming like ribbons of silver in the sunlight and presenting a striking contrast to the masses of luxuriant green which later turns to gold. It is a picture which pleases the aesthetic and the material sense alike, for it is a picture of plenty and prosperity only to be appreciated by one who has spent a day or a week in the rice belt.

#### PROFITS OF THE SMALL GROWER.

The production of this cereal in the Southwest has long since passed the experimental stage, and the man who wishes to become a rice farmer can

ORDINARY EXCAVATED CANAL AND AQUEDUCT OR FLUME CANAL.

PREPARING FOR SEEDING.

secure an ample fund of statistics from any of the various centers to enable him to calculate closely on the cost of tilling a tract of 10, 100, or 10,000 acres, for he can find companies who have invested half a million dollars to purchase and prepare "farms" of the last-named size for the industry, but the majority of the growers have confined their individual effort to 50 or 100 acres. Taking a group of the hundred-acre projects and averaging the results, the expenses are as follows: Ploughing and cultivating, \$4 an acre; seeding, \$3.50; harvesting, threshing, and hauling crop to mill or railroad station, \$5. Levee work and other items swell the total cash outlay of "making" the crop to \$20 an acre. The owner contracts with the irrigation company to furnish sufficient water for the season for one-fifth of the yield, unless he controls his water-works, which for a hundred-acre farm cost from \$1,000 to \$1,500. The harvest, of course, varies considerably. It may be 10 barrels of 162 pounds each to the acre. A specially favorable season may increase it to 15 barrels. The price, too, fluctuates. Basing it at \$3.50 per barrel for the minimum yield, the farmer obtains \$800 from his rice alone. Deducting interest at 6 per cent. on the cost of his land at \$20 an acre, taxes, and insurance, he nets a profit of \$600. But to this he can add \$500, the value of the straw and bran left after threshing. Thus 50 per cent. of the original land value may be paid by the proceeds of one year's harvest. Usually

enough vegetables, perhaps fruit, are raised for the family supply, and the tendency to diversity is becoming yearly more pronounced; for the energetic grower has an opportunity to produce some other staple during the half-year when the rice is not under cultivation. The profit may average nearer \$25 or \$30 an acre from all sources of income than the estimate given.

#### CAN AMERICA COMPETE WITH THE ORIENT?

Stimulated by their success, the aim of these ambitious agriculturists is to place the American rice belt in as dominant a position as the corn, wheat, and cotton belts. "As the South regulates the price of cotton in the world's market, the day will come when we shall dictate the rice market as well," is the universal sentiment. Although readily disposing of the bulk of their staple at home, they have already entered Europe; and with an opportunity to sell on equal terms

AT THE END OF THE HARVEST, SHOWING THE GREAT STRAW STACKS.

their Oriental competitors, they are satisfied of attaining their object. The claim that irrigated land will produce grain at a lower cost than even Asiatic fields is well founded by comparing the average yield per acre and the time and labor required. The American farmer is content to till but one-sixth of the land that the laborer in Louisiana and Texas, the American with his irrigation system and machinery can cultivate a hundred acres in a year where the Eastern competitor, depending upon natural flood-land and hand tools, can do but three-fourths of the work. Every rice expert is familiar with this fact, and one of the sources of the local optimism that prevails.

No one can predict the limit of future success.

#### CITY BUILDING IN THE RICE BELT.

The coöperation so apparent throughout the industry is another feature of interest. Everywhere is to be found an interdependence, so that the producer is not merely the landowner and farmer, but a stockholder in the irrigation company, while he patronizes another company, harvesting and threshing his crop, that sends an alliance of his neighbors. As he accumulates a surplus he becomes part owner of one of the adjacent rice mills. If a bank is needed in the neighboring town, he subscribes stock, perhaps takes a partnership in one of the mercantile enterprises. Thus are his in-

terests so diversified that the general prosperity is of as vital importance to him as the extent of the harvest itself. The economy of this plan is at once apparent in a reduction of expenses in raising and preparing the crop for market. The

RICE THRESHING OUTFIT.

bulk of the money received is held at home and distributed in local channels, benefiting those directly or indirectly interested in the main and dependent industries. The yearly extension of the area under cultivation and the consequent enlargement of the irrigation system broaden the market for necessary machinery and supplies and require additional labor. These evidences of prosperity offer inducements to immigration, not only to the agricultural element, but to the merchant and the capitalist, who realize the future of the locality and the prospective growth of its cities and towns. A stimulus has been given railroad building as well; for not only must means of transportation be afforded for the

THE "LONG TON" STEAM THRESHING OUTFIT IN THE FIELD.

yearly harvest, but for the miscellaneous articles required in town and country.

The communities which have been created include notable illustrations of the general coöperation. Townsfolk and countryfolk, alike interested in their growth, have joined in adopting plans which they hope will culminate in important cities. Indeed, some have already increased so rapidly in population and business as to rightfully deserve this title. Here is another parallel to the development of the West, for instances are known where they have originated from a nucleus of a few huts; others were born on the bare prairie, not even a tree to mark the site. The city of Crowley is a typical community. When its streets and avenues were laid out with tripod and sextant not a building stood upon the land, nor was a spear of rice growing within miles of it, but the promoters had such faith in the future that when the Southern Pacific Railway Company refused to stop its trains at a "station" in the open country, they moved a shed to the town site from an adjacent settlement, engaged a ticket agent at their own expense, and offered the building and the agent's services to the company if it would consider the

place as one of its depots. It reluctantly agreed. Next they succeeded in getting a colony of Germans to locate here, then they began excavating with their own hands the first irrigation canal in the Southwest, assisted by the colonists. From the half-mile used to flood the first rice field in 1894, it has been enlarged to 10 miles in length and 40 feet in width. The colony and the canal developed the "one-building" town into a city of 7,000 inhabitants, with courthouse, public schools, churches of the principal denominations, opera house, three banks, eight rice mills, and a score of pretentious business blocks. From its mills a million barrels of rice are sent annually to market, while its merchants serve a territory forty miles square. Throughout the belt, and far away in eastern Texas, can be found other examples of equally rapid urban growth, but these people are building for the future as well as for the present, and it can be said in all sincerity that they are forming a civilization out of this semi-wilderness that rests on a broad and permanent foundation composed of education, religion, patriotism, and the type of modern vigorous Americanism to which the great West, their example, owes so much of its prosperity.

LOADING RICE STRAW AT THE END OF THE HARVEST.

# ENGLAND'S GREATEST LIVING ARTIST: GEORGE FREDERICK WATTS.

BY W. T. STEAD.

"I often think that in the future, and in stronger hands than mine, art may yet speak as great poetry itself, with the solemn and majestic ring in which the Hebrew prophet spoke to the Jews of old, demanding noble aspirations, condemning in the most trenchant manner prevalent vices, and warning in deep tones against lapses from morals and duties. There is something more to be done in this way, I believe, than has yet been done."—*Extract from a Letter from Mr. G. F. Watts to Miss Julia Cartwright.*

FOR many years Mr. Watts has been employed in modeling a colossal equestrian figure typical of Energy and Foresight. It represents an explorer mounted upon a noble steed which he has tamed, and who, having arrived at the summit of a mountain, shades his eyes from the sun with his hand, as he looks out upon the vast unknown lands awaiting his discovery and conquest. This magnificent symbolic statue has been given by Mr. Watts to Rhodesia. It is now being cast in bronze, and will soon be on its way to the Matoppos, where it will be erected as the tribute of England's greatest living painter to Africa's greatest son. The figure is purely symbolical, and is in no sense a portrait of Mr. Rhodes; but it will stand on that lofty tableland looking out northward to the interior of Central Africa not yet spanned by the Cape-to-Cairo railroad. Mr. Rhodes stood to Mr. Watts for his portrait, and although they met only in the last year of Mr. Rhodes' life, the interview deepened the admiration and affection with which Mr. Watts had ever regarded Mr. Rhodes. The two men differed enormously, but they were alike in being idealists of the first water. Both spent their lives in making their ideals visible to mankind. They labored in very different materials,—Mr. Watts in the pigments with which he made his canvases visions of dream-like beauty; Mr. Rhodes in the roaring loom of time, founding commonwealths and rearing and wrecking empires. Mr. Rhodes has gone; Mr. Watts remains, the greatest of all the Victorians who still survive among us.

Mr. Watts and Mr. Herbert Spencer, both octogenarians, linger among us, reminding a puny generation that there were giants in those days. Mr. Herbert Spencer is a philosopher whose writings have profoundly influenced thoughtful men throughout the world. Mr. Watts is an artist whose pictures have appealed to a much wider public. It is perhaps no exaggeration to say that he is, all things being considered, the greatest of all living Englishmen.

Compared with his renown, the fame of the King cannot for a moment compare. Kings are the best advertised of mortals, for limitless advertisement is one of the most precious privileges of the monarchy. But Mr. Watts, who is a monarch in the realm of art, sways a far more potent scepter in his brush than the bejeweled staff which will be placed in the hand of Edward VII. at the Abbey.

Nor is it only that Mr. Watts is the supreme genius. He has only displayed throughout the whole of his career a sense of public duty which, unfortunately, is rare among mortals. No artist of our time has so much regarded himself as the servant of the people. No one has so lavishly given of his best without fee or reward to those whom he wished to serve. He has, indeed, been true to his own conception of the prophetic mission of the artist. As Mr. Rhodes left his millions to the promotion of his ideals, so Mr. Watts has bequeathed the bulk of his allegorical pictures to the nation, together with the portraits of distinguished Englishmen whom he had painted in the last half century. When he was a comparatively young man he painted the north side of the great hall in Lincoln's Inn, executing this fresco, which is 40 feet high by 45 feet long, without any remuneration. But how far he was in advance of his generation may be inferred from the fact that he offered the directors of the London & North-Western Railway to decorate the station at Euston with frescoes illustrating the history of the world; and although he proposed to do this at his own expense, his offer was rejected!

"In early days," said Miss Cartwright, in a charming essay which she wrote for a special issue of the *Art Journal* some years ago, "the young artist dreamt of building a great temple or house of light, with wide corridors and stately halls, containing a grand series of paintings on the mysteries of life and death. That dream, alas! was never destined to be realized, so we shall never have a Sistine Chapel adorned by the hand of our own Michael Angelo."

But, although Mr. Watts was not able to carry out that splendid idea, he has painted many pictures which, in his own words, suggest great thoughts that will appeal to the imagination and the heart, and kindle all that is best and noblest in humanity. In his later years he has painted pictures illustrative of heroism in humble life. But space would fail me to recount all his benefactions to the nation. A book containing reproductions of all his paintings, with a narrative telling the story of all the themes which have kindled his imagination and stimulated his genius, would embody most of the great traditions of our race. English history, Scripture history, and the myths of ancient Hellas have all appealed to him, and he has touched nothing that he did not adorn. But I have no intention of writing upon Mr. Watts or his art. It was my privilege last month to spend a day at Limnerslease, and to hear from the lips of the "old man eloquent" his ideas and aspirations, which I now place on permanent record for the instruction and edification of my readers.

Mr. Watts is in his eighty-sixth year. Although he is so advanced in years, he carries himself erect, and his eyesight is undimmed. He uses no glasses, walks without a stick, and until the last three or four years he was known as one of the best riders in Surrey. Eleven years ago he bought a small piece of ground on the southern slope of the Hog's Back, between three and four miles from Guildford. There he erected Limnerslease, an ideal artist's house, laid out the grounds around it, and created for himself a terrestrial paradise, with a spacious studio, admirably lighted, in which he is to be found at work every morning at sunrise. As he rises with the sun, he goes to bed with it,—at least in summer-time, when he is often up and at work with his pictures or his statues as early as 3:30 o'clock in the morning.

#### THE OCTOGENARIAN'S SECRET.

And what is the secret of this extraordinary longevity, or rather unabated vitality? Many men vegetate when they are as old as Mr. Watts, but how few there are whose natural force is unabated, and who preserve in old age the vigor, the skill, and the enthusiasm of youth!

"What is the secret, Mr. Watts?" I said.

"I have always been very sickly," was the painter's somewhat paradoxical reply. "From my earliest years I have never been robust; and, indeed, for this reason I was compelled to refrain from most of the violent exercises of youth. I neither drank nor smoked,—nor did anything, in fact. I am a very negative sort of a person. I have just lived,—with the exception, of course,

of my work. But although I have been successful, far beyond anything I ever hoped when I began life, I cannot say that the joy of life has ever been mine. I enjoy my work; I am intensely interested in it, and am continually endeavoring to improve, for," said Mr. Watts, with a delightful smile, "if I don't improve now, when shall I ever have a chance of doing so? What I mean is that the buoyant exuberance of animal spirits, which leads many people to rejoice in life for the mere sake of living, I have never known.

#### HIS CONCEPTION OF DEATH.

"Nor have I ever shrunk from death. In my works I have endeavored to destroy the fear of Death, to cause him to be regarded, not as a dread enemy, but as a kindly friend, and such has ever been my feeling. I should, of course, regret to leave work undone, and to part with those friends whom I love, but a sense of the weariness of the world and the suffering and sadness which seem to be inherent in mortal things, have weakened if not destroyed that joy of life which is common to most young things. The condition of things in this world, so far as I can see it, full of suffering and sorrow, saddens me. I feel it might have been so much better arranged in many things, and the burden of it weighs upon me. That is one reason why I feel that every theological student, before he applies himself to theology, should be thoroughly grounded in physiology. Too often theologians seem to regard the body with contempt, not to say dislike.

#### THE RELIGION OF THE BODY.

"To live a healthy life," continued Mr. Watts, "to have the body in which your soul dwells in good working order,—that is surely the first duty of the religious man. How many generations have lived and died in the belief that piety consists in the maceration of the body, and in spending many hours upon their knees crying to God to do this, that, and the other for them. Instead, how much better it would have been if they had looked after their own health and looked after their neighbors'. In the long run, the body avenges itself upon the soul which neglects or abuses its habitation. Being naturally sickly, I had orders to take care of my body. I have never smoked. Greater things were done in the world, immeasurably greater, before tobacco was discovered than have ever been done since. The cigarette is the handmaid of idleness. I do not say that possibly it may not be a sedative to overwrought nerves, but overwrought nerves in themselves are things that ought not to be. Of wine I have taken very little. In my earlier years I

MR. GEORGE FREDERICK WATTS, R.A.

(From his latest photograph.)

used to take a little, but for a long time I have never touched any form of alcohol. At meals I never drink anything, not even water. Tea,—yes, in moderation. And so with regard to food I have been compelled to be very abstemious,—to eat moderately and of simple food, to go to bed early (9 o'clock, for the most part), to rise with the sun, to avoid violent exercise, and to enjoy plenty of fresh air."

#### HIS FAITH IN PROGRESS.

Mr. Watts' regimen has left him, for a person "naturally sickly," in possession of an extraordinary amount of vitality. For nearly two hours England's last remaining Grand Old Man stood on his feet discoursing with eloquence and fervor upon many subjects that are very dear to his heart.

"I am a firm believer in progress," said he; "but in some respects we have not progressed, but retrogressed. Certain faculties which animals and savages possess are no longer at our command. Our senses are not so keen as they were, and some we have lost altogether. Take, for instance, the extraordinary homing faculty which belongs to most animals and a great many

savages. Very few civilized men possess the faculty of finding their way home when they are lost in the midst of a great city. I remember a friend of mine who possessed that faculty in an extraordinary degree. We would occasionally walk together to the east of London, and sometimes entirely lose our bearings. I could never have found my way home, but my friend was never at a loss. No matter where he might be, he always struck out for home, and found his way back without any doubt.

"Take another instance,—eyesight. I remember Sir William Bowman, the oculist, telling me of some educated Zulus whose eyesight was so keen that they could read the *Times* newspaper at the distance of one wall to the other of his consulting room! Whether we could regain those lost faculties or not I do not know. We are crowded together in cities, a healthy country life is impossible to an increasing proportion of our people, and our physique is decaying.

#### ARCHERY AND PHYSIQUE.

"When I was in Yorkshire, some years ago, the friends with whom I was staying showed me one of their cherished relics, a long-bow, which, according to tradition, had been the weapon of Little John of the Robin Hood ballads. A little bit was broken off one end, but it was otherwise intact. That bow was as thick as my wrist. Just imagine a modern man set to draw such a bow. He could not move it; it would be absolutely impossible. How was it possible in those days? It was because the whole population was trained to the use of the bow. It was practiced with pleasure by everybody. Ask one of our modern toxophilites to handle such a bow, and he would laugh at you. I don't suppose we could restore the practice of archery in our country; but if we could, it would do more than anything else to restore the physique of our people. As Bishop Latimer said in one of his sermons, he was taught by his yeoman father to throw the whole weight of his body into his bow hand. Evidently the aim was suddenly taken by the left hand; and in this way they of olden time launched the arrows which did such havoc at Crecy and Agincourt. You can easily conceive how it developed the chest, and strengthened the muscles of the arm, and perfected the physique. The modern rifle is a miserable substitute.

#### THE CASE FOR CONSCRIPTION.

"I am inclined to believe," said Mr. Watts, "that nothing would be better for the physique, and also for the morale of the population, than the adoption of some system of compulsory mili-

LIMNERSLEASE: IN THE ENTRANCE HALL.

MR. WATTS' SURREY RESIDENCE, "LIMNERSLEASE."

tary service. If every young man were to be subjected to two years of salutary discipline in the camp, and more especially in the navy, he would learn to obey, and be passed through a rigorous physical training. In Germany, at least, I understand that there is only one opinion as to the physical and moral benefits of military training."

I said my impression was that in France there were somewhat different opinions; that young men learned a good many things in the barracks that were anything but moral.

"I don't know," said he. "Probably they would have picked them up all the same if they had been scrambling round with nothing to do in their own villages.

#### IN PRAISE OF SAILORS.

"But I much prefer the training of a sailor to that of a soldier. It was my fortune to spend some time once upon a man-of-war. I was immediately impressed with the sailor's life. The sailor is trained first of all to observation, and observation is, after all, the root of education. Sailors are intelligent, resourceful men, full of vitality, genial, good-tempered men. I suppose

we must always have soldiers and sailors, if only to keep our own shores safe from attack. But if I had my way, I would make it compulsory for every soldier to spend a certain portion of his time on board ship, and at the same time I should let the sailor have every opportunity of learning to ride and shoot.

#### BRITISH HORSEMANSHIP.

"We plume ourselves in England on being the best horsemen in the world, and I am not by any means sure that we are not the worst. To be a good horseman is much more than merely to be able to keep your seat in the saddle. Take, for instance, the question of the bit. You will constantly be told that you should always ride your horse with a snaffle and no curb, because then you don't hurt the horse if you pull him with the bridle. On the contrary, a sharp bit and a light hand,—indeed, anything but a light hand with a sharp bit,—will not do, as the rider would soon find. A good rider depends upon his grip, knees, and movements of his body for the security of his seat and indications of his will, never depending on reins or stirrup at all for firmness in the saddle. No groom is

ever taught this, and every horse's mouth is spoiled. I regard riding as one of the fine arts. I love a horse, but would abolish the Turf,—fruitful source of gambling, the one vice for which Nature offers no excuse ! ”

#### A PLEA FOR REAL EDUCATION.

Mr. Watts warmed to his subject as he spoke. “The education of the people,” he continued,—“that is the great question. Why do you not concentrate attention upon that? To educate your people, to draw out of them that which is latent in them, to teach them the faculties which they themselves possess, to tell them how to use their senses and to make themselves at home with nature and with their surroundings,—who teaches them that? Your elementary schools don't do it. No; nor your public schools. Your Eton and your Harrow are just as much to blame, perhaps even more so. What is the first object which a real education should aim at? To develop observation in the person educated, to teach him to use his eyes and his ears, to be keenly alive to all that surrounds him, to teach him to see, to observe,—in short, everything is in that. And then, after you have taught him to observe, the next great duty which lies immediately after observation is reflection,—to teach him to reflect, to ponder, to think over things, to find out the cause, the reason, the why and the wherefore; to put this and that together, to understand something of the world in which he lives, and so prepare him for all the circumstances of the life in which he may be found. But observation! Was there ever any method less calculated to develop the habit of observation than the practice of cramming up boys with the Latin and Greek grammar?”

“Heaven forbid!” said Mr. Watts, “that I should say a word against the learning of Latin or Greek. I am all in favor of mastering the language of the classics, especially Greek; but the knowledge of the language is but as an instrument with which you can unlock the treasures of thought of these people. What do you do? You send your boys to school, and simply impress, as it were with a stamp, the rules of grammar, to them utterly meaningless, and till applied utterly without interest. The result is that in nine cases out of ten a boy never gets more than a smattering of the language, and forgets it as rapidly as he possibly can after leaving school.

#### THE DOMESTIC ARTS.

“It is typical of the how-not-to-do-it way that is characteristic of all our education. It neither teaches a man to live, nor how to make the best of himself, nor how to make the most of his

surroundings. Look in any direction you please. You turn out hundreds of thousands of young men and young women from your schools to mate and to make homes for themselves without teaching the girl how to bake or how to cook, and the boy the best way to lay a fire or boil a kettle. Everything hinges upon this,—they are not taught to observe; they are not taught to reflect; and education, instead of being the development of those faculties of the mind which enable them to use their senses, and to reflect on what they see, has given place to a mere mechanical stamping upon the memory of forms of words many of which have no relation to anything that they will have to see and do in their after-life.

#### THE EDUCATION OF A SAILOR.

“Contrast this with the education of a sailor. Oh, I wish,” said Mr. Watts, “that you would endeavor to rouse public opinion on this subject, to point out the abominable waste that goes on of human faculties, the amount of misery that comes into the world from the fact that our young people are turned loose without any training that is calculated to make them happy and comfortable. The smaller their means, the more need there is for them to be able to make the most of them. But we have had an opportunity recently of seeing what can be done by giving something of the education of the sailor to our village lads. A boy in this neighborhood who was left without proper guardianship was sent to school for a little time, and then afterward sent to a training ship. He came back recently on a visit to the old village, and his people were surprised by the change that had been wrought in him. It was a transformation; the lad was respectful, alert, quick in movement, nice in his manners, and his faculties had been thoroughly trained. Now what an object lesson is that! Here is a great task that might surely be commended to the attention of those excellent ladies who are to be found all over the land who are anxious to do good, but who do not know exactly how to set about it.

#### THE WASTE OF CHILD-LIFE.

“Why should they not endeavor to check the waste of child-life that is going on, and to recognize in practical fashion the guardianship which the nation owes to these its wards? Have you ever thought how many children there are growing up in our midst who have either no parents, or worse than none,—children of tramps, the offspring of criminals, or orphans, disinherited even of parentage,—who are growing up, if not exactly nobody's children, nevertheless without adequate parentage? Why should we not recog-

nize the redemption of these children as one of those sacred tasks which in every age have appealed to the chivalrous sentiment of people? I would not call them Children of the State. No; they are the Children of the Nation, and the nation should set itself to the task of their redemption. Here and there philanthropists, no doubt, have done excellent work; but still, after all that has been done, how many thousands of children at this moment are growing up unnurtured, untended, uneducated in the worst sense of the word, to swell the tide of human misery! It is a marvel to me. It only shows how good we were originally, that human creatures who have such an origin should not grow up positive fiends.

#### THE MOST URGENT REFORM.

"There is, in fact, some goodness in human nature that seems ineradicable by circumstances. Even among the Hooligans and roughs of the slums you will find immense capacities for self-sacrifice, which are occasionally revealed when fires or accidents make a sudden appeal to the heroism of humble life. Why should we allow such rough diamonds to escape without giving them adequate setting? It seems to me that we should stud the coasts of our country with training ships in which we should give the best education in the world to these Children of the Nation who are growing up to be the scourge and despair of civilization. This is the most urgent reform,—the utilization of the waste of humanity. I remember my old friend Lord Aberdare telling me once of a stream in Wales which was polluted by the waste product of some factory that had been established higher up the hills. It was a beautiful stream before the poisonous chemical refuse was flung into the upper water, but after that it was poisoned. All remonstrances were in vain. The owners of the factory relied upon legal right, and went on polluting the stream,

THE PAINTER AT WORK.

(Mr. Watts uses neither palette nor maul-stick.)

until at last the dwellers down stream took counsel with some chemists. They intercepted the waste product of the factory, and found that it was possible, by chemical treatment, to convert it into a source of great revenue. So it is with us. This stream of neglected boyhood flows into the channel of our national life at present.—neglected, waste, and poisonous material. But training ships would be as the crucible of the chemist, converting what had been a source of danger into a source of health, strength, and wealth to the community."

I ventured at this point to state the familiar objections to institutions for training children, and said I thought a very third-rate mother was better than the best head of a barracks. Mr. Watts said he did not argue in favor of huge institu-

tions. His idea was training ships. When painting his memorial to the heroes in humble life he had been more and more impressed by the way in which the primal instincts of manly heroism burst out and flowered under most rough and rugged surroundings.

#### THE LAW OF COMBAT THE LAW OF LIFE.

"How is it," I asked, "that human society always seems to go rotten at the top?"

"It is a natural law," said the painter; "for the struggle for existence cannot be suspended without loss. The law of combat is the law of life. When a man is comfortable, and has all that he wants, his fibers become relaxed. He is no longer pressed by the daily and hourly contest which is the condition of a strenuous life. Hence all races tend to decay when they achieve comfort. And that law of combat," said he, suddenly giving the conversation a personal turn, "is what you ignore in your opposition to war. War is but the ultimate form,—gross, rude, horribly painful, no doubt, but the culminating

point of the rock of combat which is the condition of progress."

I ventured to protest against that theory.

"Logically," said I, "your principle, which I accept in certain aspects, would, if applied as you apply it, lead you to advocate the restoration of the Heptarchy or of the condition of internecine feud which prevailed in the Middle Ages. It seems to me that war between nations is simply a hideous waste of forces, which, if compelled to confine their combat within less barbarous bounds, would produce greater results for the good of the race."

#### THE PARABLE OF THE MUSCLES.

Mr. Watts shook his head.

"You may be right, but the time for achieving that ideal is not yet come. You must learn to tolerate the universal law which governs the progress of mankind. It does not follow that when you go to war with people you hate them. I think that our soldiers in South Africa have demonstrated that. They have done their best to

THE POTTERY AT LIMNERSLEASE.

INSIDE THE POTTERY.

defeat the Boers who invaded our territory. Having defeated them, they harbor no ill will, but regard them with humane feelings. No, no," said he, clinching his fist and stretching out his right arm, "combat does not involve malice. Difference of function does not imply even antagonism. Look at my arm. With the extensor I thrust out my arm; with the flexor on the other side I draw it back. The two muscles have absolutely opposite functions, but you need both of them in order to use your arm. So it is in life. There is an apparent opposition, a duality of function necessary to build up a true unity. Hence intolerance of opposition is one of the worst sins against progress."

## CREEDS AS PICTURES.

"Creeds," said he, "are all very well in their way; but, after all, they are but pictures of the Infinite as seen by the human mind. Take an illustration. I have seen some picture of some natural object, and I wish to make you understand what it is. Far simpler than to describe it in words is to make a picture,—draw a sketch, and let you look at it. It is the same with creeds. The Church makes creeds as I make a picture. For the ordinary man, who has had no vision himself, it suffices. If you can see the object yourself, you recognize that my sketch is only a picture, and not the real thing. The tendency is always to substitute the sketched object for the reality. Look at this hand," said he. "What wonderful things we can do with the human hand."

I looked at it closely, and wished that I could read the secret of the innumerable lines which crossed and re-crossed, not only the palm, but every phalange; the hand of the artist and thinker,—a hand every inch of the surface of which was scored deep with eloquent lines.

Mr. Watts was not thinking, however, of palmistry. He was bent upon giving me one of those homely illustrations with which his conversation abounds.

## THE PARABLE OF THE FINGERS AND THE THUMB.

"Here," said he, seizing the forefinger of his right hand in the finger and thumb of his left, "do you see that?

That stands for faith, that for hope, and so on," he continued. "These four fingers represent the ministration of man. They stand for Religion. Now look at the thumb. The thumb stands for Reason. Cut off a man's thumb, and what can he do? Nothing, except perhaps hang on to a bar with his fingers. Take away the fingers, and what can he do with his thumb? And so it is in life. The human race loses the use of its hand when religion is divorced from reason or reason from religion. As you must have your fingers and your thumb in order to grasp anything, so man needs both reason and religion in order to conduct his life. But stay," said he; "I have had typed out for you two quotations which seem to me to express the highest thought uttered by man upon the subject of religion. There is nothing higher or simpler or more noble."

## TWO GOLDEN SENTENCES.

With that he left the room, and presently returned with a sheet of paper on which were typewritten two sentences. "The first," he said, "contains the closing words of the speech of Abraham Lincoln":

With malice toward none, with charity for all, with firmness in the right as God gives us to see the right, let us strive on to finish the work we are in, to bind up the nation's wounds, to care for him who shall have borne the battle, and for his widow and his children, to do all which may achieve and cherish a just and lasting peace among ourselves and with all nations.

"Oh, he was a great man, Abraham Lincoln,

one of the greatest of men. I suppose," said Mr. Watts, "Napoleon, if he had been a good man, would have been the greatest man that ever lived; but he was not a good man, and so he fell short. But for intellect and energy and genius he was the greatest of all. Ah, if he had but been capable of uttering such words as those of Abraham Lincoln, then he would have towered aloft. But read my other text, which is shorter":

What doth the Lord require of thee, but to do justly, love mercy, and walk humbly before Him.

"An utterance of an old Hebrew which should appeal to every Christian. The essence of it all is there."

#### THE UTMOST FOR THE HIGHEST.

"Yes, indeed," I said, "and the essence of all religion is the same. What is wanted is to create some center where the best thought of the best men, all the best that has been done and thought in the world, should be rendered accessible to every one, and that from that center should go forth the energizing force, reviving civic religion and summoning and directing us all in the service of mankind."

"Ah, yes," said he, "if you could make *such* a church, then indeed we would all belong to it. You know my motto," he continued, pointing as

he spoke to a sundial which bore eloquent testimony to the skill of the potter-artists who worked under the direction of Mrs. Watts. I read the inscription.

"'The utmost for the highest.' That has ever been my watchword. Do you not think it is a good one?"

"Yes, indeed," I replied. "But it is easier for us to know when we have done our utmost than to be sure about the highest."

The painter did not speak, but, walking a little way, he picked up a daisy from the lawn and gave it me.

"It is my flower," said he; "a humble thing, but it ever looks upward."

#### MR. RHODES.

"Ah," said Mr. Watts, "Mr. Rhodes was a great personality, one of the few of the great ones who were left to us. Bismarck, I suppose, was a great man; but here among us I do not see any other personality so great as Rhodes. You know, he came," said Mr. Watts, "at six o'clock in the morning, and stood here for his portrait for two or three hours. I never finished it. Some day I hope I shall do so. He was a great man, and yet," said he, "I do not know that I care very much for the idea of Imperialism."

#### THE STATUE OF TENNYSON.

One of these good men to whom England gave birth in the nineteenth century is engaged in modeling plaster. Mr. Watts took me to the outbuilding in which he was modeling a colossal figure of Tennyson. It represented the poet wearing his familiar cloak. The head, though not then placed upon the shoulders of the gigantic figure, began to bear a striking likeness to the dead poet.

Speaking of ideal figures, Mr. Watts mentioned incidentally, when we were talking in the studio, that in painting his ideal pictures he never employed the services of any model. By this means he avoided the danger of introducing the copy of an actual physical creature into a picture which was designed solely to represent an idea. If he found himself at a loss for any particular anatomical detail, he would model the figure in clay, and use that as a guide to his brush. Of late Mr. Watts has been painting trees. His pictures, of panel shape, were painted from trees which can be seen from the windows of Limnerslease. There was a large unfinished picture in his studio representing Repentant Eve. Eve, mother of all mankind, stands with her back to the spectator, treading under foot a white lily, while a long glorious

THE DOOR OF THE MORTUARY CHAPEL.

THE MORTUARY CHAPEL AND GRAVEYARD.

wealth of flaxen hair streams from her head, which is slightly bowed in grief.

"It is a study," said Mr. Watts, "of penitent woman, which is probably the highest form of womanhood; and yet they are often penitent, poor things," he said, "when they have little reason for remorse. They suffer much at the hands of others."

#### THE GENEROSITY OF GENIUS.

Mr. Watts has been singularly reckless and prodigal with the gifts of his genius. Now and then he sells a picture merely to supply the wants of every day; but most of his work he has done without other fee or reward than the consciousness of artistic creation and the joy of his art. From the time he was sixteen,—that is to say, for three score years and ten,—Mr. Watts has maintained himself by his brush. He might have been a very wealthy man, but he is one of the children of light whom the skill of the children of the world in amassing worldly gear repels rather than attracts. In the course of an artistic career extending over the life of two generations, Mr. Watts has been brought in contact with men in all sorts of positions, from the

King on the throne to the Hooligan in the street. I asked him whether he had ever kept a journal. He said, no; he did not care for personal gossip.

#### THE PARADISE OF LIMNERSLEASE.

After lunch, while Mr. Watts rested, Mrs. Watts took me round the little domain, which was beginning to glow with the early glory of spring. It was difficult to realize that all this wealth of shrubbery and wood was the growth of only eleven years. Everywhere the touch of the master and the grace of the mistress had together made Limnerslease itself a beautiful picture, the idyllic peace of which imprinted itself upon all its denizens. Mr. Rhodes was deeply impressed with the sweet serenity and calm of the artist's retreat. The servant who opened the door, the man who drove him to the station, seemed to share in the restful ease which soothed and tranquillized the eager Colossus. "And do you know," said he, in his odd way, "I believe if I had gone down to the kitchen, I am sure I should have found the same sweet serenity on the face of the cook."

A little way to the south of the house, in the valley, lies the art pottery works originally es-

established as a kind of recreation school for the use of the village, and now carried on as a serious business under the personal supervision of Mrs. Watts. It is a very interesting experiment, and one which, I am very glad to know, is succeeding well. Mrs. Watts, like her husband, is a great believer in the latent artistic capacity of the English child.

"Train him early, let him taste the joy of creative work, and you can achieve much greater things with him than we have yet ventured to hope."

The pottery naturally suggested itself as one of the most obvious and simple means by which to teach children to make things. Near Limnerslease lies a long deep narrow stratum of clay, the product of the attrition of granite boulders in ages long gone by, which have left behind them this clay as part of the inheritance of the human race. From this stratum the clay is brought out, disintegrated by winter's frost, then caked together, and passed through a mill whose revolving knives chop it up. It is then taken to a well, where it is mixed with water, and in the consistency of a muddy liquid it passes through a fine sieve into the vats, where it remains until sufficient moisture is removed to render it available for the potter's wheel. The one great staple

of the pottery manufacture is the great globular vase which is usually brought from Italy, but which can now be supplied from the Compton pottery. Another important department of the output consists in the manufacture of window-boxes in what appears to be terra cotta, with beautifully modeled bas-reliefs and fronts. These are supplied at 10s. and 12s. 6d. each. The cost of the vase is 20s.

#### THE WORK OF THE VILLAGE ARTISTS.

They also produce sundials in clay at various prices, everything being done with the hand, and nothing by machine or by mould. Endless varieties of pattern can be obtained. All the productions are stamped with a special seal. I saw some of these, on the bases of which the heraldic bearings of the purchaser had been carefully modeled, and then affixed to the side of the globe. All manner of charming, quaint, and symbolic work can be seen at the pottery; but to see what can be done when good clay is moulded by nimble fingers under the direction of an artistic brain, a visit should be paid to the mortuary chapel in the little graveyard, close to Limnerslease. It is all the work of the Compton people, and the iron-work at the door was done by the village blacksmith.

#### A LIST OF SOME OF MR. WATTS' MOST IMPORTANT WORKS.

"The Wounded Heroes" and two portraits of women, first exhibited at the Royal Academy in 1837; "Isabella Finding Lorenzo Dead," from Boccaccio (1840); " Caractacus Led in Triumph Through the Streets of Rome" (1842); "Alfred Inciting the Saxons to Prevent the Landing of the Danes by Meeting Them at Sea"—a cartoon (1847), for which he won a prize of £500, purchased with his "Echo" by the Commissioner, and now at Westminster; "Justice," or "School of Legislation" (1850), a fresco, in dining hall of Lincoln's Inn; "Orlando Pursuing the Fata Morgana" (1848); "The Good Samaritan" (1850), painted in honor of Thomas Wright, of Manchester, and presented to the Town Hall of Manchester by the artist; "Life's Illusions" (1849); "St. George and the Dragon," a fresco, in the upper waiting room at Westminster, begun in 1848, and completed in 1853; "The Window-Seat," "Sir Galahad" (1862), "Virginia" and "Ariadne" (1863), "Esau" (1865), "Love and Death" (1877), presented by the artist to Whitworth Institute at Manchester; "Paolo and Francesca" and "Orpheus and Eurydice" (1879), both in possession of the artist; "Psyche" (1880), "Rider on the Pale Horse" and "Rider on the White Horse" (1881), "Rider on the Black Horse" and "Rider on the Red Horse" (1883), "Love and Life" (1884), "Death of Cain," "The Soul's Prism" and "Hope" (1886), in possession of William R. Moss; "Love Steering the Boat of Humanity," exhibited this year at the New Gallery.

Among his sculptured works are "Clytie," "Statue of Hugh Lupus," "The Huntsman" (at the Duke of

Westminster's country seat, near Chester), "Physical Energy," and the recumbent figure of Bishop Lonsdale in Litchfield Cathedral.

He has painted portraits of Guizot (1848), Tennyson (1859), also one early unfinished study and a painting finished from the study in May, 1890, another in possession of the Dowager Lady Bowman, another in red robes at Trinity College, Cambridge, and another in a peer's robes in possession of the artist; Browning, Swinburne (1865), William Morris, Carlyle, J. Stuart Mill (1874), Matthew Arnold, Dean Stanley, W. E. Lecky, Gladstone (1865), the Duke of Argyll, Leslie Stephen, Holman Hunt, Burne-Jones, Millais, Leighton, Lord Lyndhurst, presented to the National Gallery by the artist, with portraits of Lord John Russell and Lord Lyons; John Lothrop Motley (1882), Cardinal Manning (1882), Lord Lytton (1882), Sir Alexander Cockburn, Viscount Sherbrooke, Mrs. Frederick Meyers, Marquis of Salisbury (1884), Earl Lytton (1884), Rt. Hon. Gerald Balfour (1890), Livingstone, Joachim (1867), Dr. Martineau, Calderon, Max Müller, Lady Mount-Temple, Walter Crane (1893), Sir Andrew Clark, the Hon. Mrs. Percy Wyndham, Major-General Baden-Powell, exhibited at this year's Academy, and several portraits of himself, one in possession of the Dowager Lady Bowman, and one in the Uffizzi at Florence. Mr. Watts has painted five generations of the Ionides family. Many of the portraits first in the list were seen at the Metropolitan Museum of Art in the winter of 1884-85. A number of these portraits will go to the nation.

# INDUSTRIAL AND COMMERCIAL CONDITIONS IN CUBA.

BY ALBERT G. ROBINSON.

**C**UBA'S present is dark with the gloom of industrial disaster and commercial stagnation. Her future is bright with the promise of peace and abundant prosperity. Given a land of immeasurable fertility, readily accessible to the markets of the great world outside it,—a land receiving in due measure the kiss of the sun and the benediction of the rain,—and, if that land be not unduly and artificially barred from the world's markets, prosperity is inevitable. That is Cuba's future. The days which lie immediately before her are filled with an uncertainty which renders prediction concerning them little else than folly. But, sooner or later, the clouds and the doubts which overshadow the Cuba of to-day will pass, and the island will take its place in the world as a land of peace and plenty.

## SPANISH TRADE RESTRICTIONS.

Cuba's present distress is but the crisis of an economic disease of many years' standing. The original provoking cause was the unjust and unwise colonial policy adopted and maintained by the mother country. It began as far back as the year 1503, when a royal ordinance established the Casa de la Contratacion, or House of Commerce, at Seville. This body was empowered to grant licenses, to dispatch fleets, and to regulate and control Spanish colonial trade as an exclusive monopoly. In 1717, the institution was transferred to the port of Cadiz. The colonial trade was thus restricted to a single Spanish port. Further restrictions prohibited both intercolonial trade and trade with any country other than Spain. For a period during the seventeenth century such trade was made an offence punishable by the death of the trader and the confiscation of the property involved. In the first fifty years of Cuba's history, Santiago was the only port of the island through which merchandise could be either imported or exported without violation of the law. With the establishment of Havana as the capital, in 1552, that city became the only port officially recognized. With the exception of the brief term of British occupation, 1762-63, this condition obtained until the close of the eighteenth century. A royal order, issued in 1801, opened the other ports of the island to foreign trade. This was annulled

by another order in 1809. A few years later a new policy was adopted. The ports were opened, but the same results were accomplished by a system of discriminating tariffs which gave Spain a practical monopoly of Cuban trade. This continued, subject to sundry minor modifications, until the execution, in 1891, of the reciprocity treaty with the United States. With the termination of that treaty, in 1894, there came a reversion to the old system of discriminating, preferential, and special tariffs in favor of Spain and against all other countries.

This restriction of the fullest development of the resources of the island was one of the prominent fundamental causes of all the numerous revolts, large and small, which have occurred in Cuba since her first really notable revolt, in 1823. The Ten Years' War (1868-78) made no serious inroads upon Cuba's production. The abolition of slavery, finally effected in 1886, made a material difference in the cost price of her products. This was one of the direct results of the Ten Years' War. Coincident with the war and this enhanced cost of sugar production, there came the vigorous competition of Europe's bountied beet sugar, which forced the f. o. b. prices of Cuba's raw sugar down from 5 to 5½ cents per pound, which it obtained from 1870-80, to 2½ to 3 cents per pound twenty years later. To meet this competition, Cuban planters borrowed heavily for the construction of grinding mills equipped with modern machinery. In spite of the benefits of the years of reciprocity between Spain and the United States (1891-94), the outbreak of the revolution of 1895 found many Cuban planters burdened with overwhelming mortgages, and facing a further downward tendency in sugar prices. The three years of devastating war destroyed scores of mills and plantations, but it did not destroy the mortgages and the financial obligations of the planters.

## ECONOMIC CONDITIONS AFTER THE SPANISH- AMERICAN WAR.

American intervention, in 1898, terminated a war which left Cuba an industrial wreck, with her finances in a state of chaos. Unfortunately for Cuba, and for the United States as well, her real condition was neither realized nor under-

stood by those who essayed her political redemption. There was a distinct failure in the diagnosis. Of those who were sent to administer the affairs of the island, only one man, Gen. James H. Wilson, correctly diagnosed the disease, and prescribed, in general terms, the proper remedy. In the report submitted by that officer, under date of June 20, 1899, there occurs the following :

I am so convinced of the futility of approaching the problem of reconstruction from any other direction that I must again urge the necessity of some action to relieve the wants of the agricultural population, and to put agriculture on a sound basis with the least possible delay.

In his report, dated December 31, 1900, Señor Perfecto Lacoste, the Cuban Secretary of Agriculture, Commerce, and Industry, states :

No order of general nature has been issued during the period to which this report refers, nor during the six preceding months, which comprise those of the occupation of the island by the intervening government, relating to our agriculture.

In a later report, dated March 15, 1901, Señor Lacoste makes the same statement for a second time, and it might with equal accuracy have been included in a report dated May 19, 1902. Cuba's present economic distress is no surprise to those who have watched the Cuban situation during the term of American intervention. For two years the Cuban press has sounded a warning ; for two years bankers and merchants throughout the island have noted the coming storm. Those in whose hands lay the power of relief, and upon whom there rested the responsibility for relief, were blind to the danger signals and deaf to both protest and warning. As nearly all of these were printed in the Spanish language, they did not come to the general American reading public, and such translations as were submitted were brushed aside as the querulous complaints of the disgruntled or the pessimistic. For their bearing upon the subject, I quote the following translations from editorials which appeared during the winter of 1900-01 :

Over a year ago it was clearly seen and predicted by those who took the trouble of looking into the matter, that unless some general measures were taken to assist the agricultural interests and other industries of the island, its productive capacities would be so crippled that the economic and commercial life of the country would dwindle to almost nothing. That is now taking place, and at so rapid a rate that, if immediate remedy is not applied to the evil, it will soon reach appalling proportions, and misery and destitution will become a sad reality.—(*El Avisador Comercial*, Havana.)

What has the intervention done during the two years which have passed ? Nothing has been done for our permanent interests ; nothing to encourage our production ; nothing for our extinct credit ; nothing to revive our paralyzed industries ; in one word, nothing by

which we could be assured of life, or which would give us confidence that the result of our energies would be the provision for our necessities.—(*El Nuevo País*, Havana.)

It was to be presumed that the intervening power, on taking charge, would attend more to giving an impulse to our agriculture and our few industries than to the production of that Niagara of unnecessary ordinances with which it has augmented the existing laws of our country. But it appears that the necessities of politics—which ought to be laid aside when it is a question of economical existence—overshadowed all other considerations.—(*La Independencia*, Santiago.)

I take these from such clippings as lie immediately at hand. They are sufficiently representative of a large amount of similar matter which has appeared within the last two years. Any thoughtful investigation of the past three years in Cuba will disclose ample evidence to show that America's responsibility for Cuba's present industrial distress antedates, by several years, the failure of Congress to agree upon a plan for a reciprocity treaty with the island. Cuba's normal position as a commercial country, in time of peace, is that of a creditor nation to the extent of \$30,000,000 to \$40,000,000 a year. After three and a half years of American government, her merchants are indebted to foreign creditors to the amount of nearly \$50,000,000, and are relying upon those creditors to see them through an almost inevitable period of utter stagnation in commercial lines.

#### OUR RESPONSIBILITY FOR CUBA'S ECONOMIC WELFARE.

This is not a pleasant picture, but it is, unfortunately, only too accurate. The fundamental purpose of the United States in her intervention in Cuban affairs was not the establishment of Cuban independence. It was the establishment in the island of conditions which would put an end to disturbances which were a "menace to American interests" and "intolerable" to the American people. A peaceful Cuba might be an independent nation or a colonial possession of any country. Our primary object was the establishment of that peace and order and governmental stability which rest upon the contentment of a reasonably prosperous people. Cuba's long-standing disorder was rooted in oppressive economic conditions. Spain failed to remedy the evil which existed in her colony. She was in large measure directly responsible for its existence. The United States interfered, and, blindly or otherwise, sought to remedy an economic evil by the application of political plasters. It is the testimony of competent observers,—Cuban, Spanish, American, and European,—that Cuba is today worse off, economically, than she was at any

time under Spanish domination. The proper remedy and the power to apply it have been in American hands for more than three years. Cuba's streets may be the cleanest in the world, and there might be a schoolhouse to every one of her 28,000,000 of fertile acres; but if her industries are wrecked,—her planters, the source of her wealth, bankrupt; and her laboring class without employment and destitute,—clean streets and schoolhouses will be an inadequate substitute for national prosperity. No parallel lies between the Cuba of to day and our own South in 1865. Northern capital went into the South to develop its resources, and the South had free access to the market for her products,—her cotton, her tobacco, her rice, and all the rest of her boundless resources. Give Cuba that market, even now, and her government is assured, and her people will knock at no man's door for alms or aid.

It is a frequent comment that the future of Cuba depends absolutely upon her commercial relations with the United States. That is true, as a broad proposition. Cuba's highest and most rapid development hangs chiefly upon the utilization of her resources by American capital, and upon an open doorway to the markets of her northern neighbor. Cuba is distinctly an agricultural country, dependent for her wealth upon the products of her soil. There is little or no probability that her manufactures will ever be more than a comparatively insignificant item in her economy. Her trade and her commerce are almost entirely in the hands of the Spaniards. The Cuban does not take to trade. He is a man of the soil; or, if he be not a planter, he takes to some profession,—law, medicine, engineering, or politics. It is entirely safe to say that, to-day, no more than a small percentage of the total wealth of the island is represented by the possessions of those who are distinctly Cubans. Taking the figures given in Sanger's Census of 1899, it appears that the total real-estate valuation of the island is, in round figures, \$325,000,000. This is mortgaged to the amount of about \$250,000,000.

#### NEED OF AMERICAN CAPITAL.

An unfortunate mistake has been made in the presentation of the Cuban case during the past winter. She has been put, and to some extent has put herself, into the attitude of a petitioner if not a beggar. The truth is, that Cuba can offer an ample *quid pro quo* for any concessions which might be made in our tariff. Out of her long list of customers, the United States can show only five foreign nations whose annual purchases exceed \$75,000,000. A reasonably pros-

perous Cuba can offer us a trade which would give her the fourth if not the third place on our list, while a highly developed Cuba might well become a purchaser of some \$200,000,000 worth of food and manufactured products per year. This highly developed Cuba is a ready possibility. But it is quite within bounds to say that the development must and will come through the investment of American capital. Spanish capital is not inclined to industrial exploitation. More or less of it is available for loans and for investment in fairly stable enterprises after they are established, but it is rarely available for the initiation of such enterprises. The Cubans have no money for either investment or development. Few of them now have enough for even the proper up-keep of their mills and plantations. Some European capital is already in Cuba, notably the English investment in Cuban railways and cigar factories. But it is to American capital that Cuba will look for its widest development.

#### PRESENT AMERICAN INVESTMENTS.

In 1894, the year preceding that of the insurrection, it was estimated that some \$50,000,000 of American money were invested in various properties and enterprises in the island of Cuba. During the war period there was little or no increase of that amount. The estimates for the present time are in the vicinity of \$80,000,000. It is impossible, under existing conditions, to obtain exact figures, but this sum may be accepted as a fair approximation of American investments in Cuba at the present time. A part of this sum is represented by the holdings of non-resident investors; a part by the property of native-born Cubans who have become American citizens by naturalization, though their property and their homes are in the island; and a part shows as the possessions, generally small in amount, of Americans who have gone to Cuba for permanent residence and business.

For various reasons, chiefly because of political uncertainty and the unavoidable conditions of a period of transition, American investment in the island, during the last three years, has come short of the optimistic predictions which found circulation during the opening days of the American occupation. Notwithstanding the unfortunate conditions of to-day, there has been a notable rehabilitation of the industries of the island. Credit for this is due, almost entirely, to the efforts of the Cubans themselves. Although woefully destitute of resources, they have struggled manfully to pick up the threads of the old life, to establish homes where there were but ruins, and, by a most commendable method of mutual helpfulness, to provide for themselves

and for those dependent upon them. To those of us who saw the devastation and the destitution of three and four years ago, this is one of the most impressive and hopeful features in the life of the island.

Among the outside influences which are now contributory toward the reconstruction of the island, the most important and the most valuable is found in the department of railroad communication.

#### RAILROADS.

The first railroad in Cuba was built more than fifty years ago. The system developed gradually until, at the outbreak of the war, it represented about 1,100 miles of road, much the greater part of which was in the western portion of the island, with a center in Havana. About two-thirds of the island was practically without railway facilities. The war left the railways in bad condition, and many of the Cuban and Spanish stockholders were ready to part with their holdings. American investors looked the properties over, but decided that the prices asked were entirely unreasonable, and declined to purchase. An English company already owned the line from Havana to Pinar del Rio. Another English company bought up the system known as the United Railways, which covers, generally, the ground for a hundred miles or so to the eastward of Havana; and another English organization secured the Cuba Central Railway, which occupies a portion of the field eastward of the United Railways. These companies have done something in the way of improvement and reconstruction, but nothing in the way of extension.

The leading railroad feature of the island is the work being done by the organization of which Sir William van Horne is the directing head. The company holds a New Jersey charter, and its purpose is a colossal development enterprise in which its railway line is but an incident, although, necessarily, the whole scheme rests upon means of transportation. Up to the present time nearly, if not quite, \$10,000,000 has been actually expended. For some months a force of 5,000 to 6,000 men has been busily at work clearing a way through forest and jungle, grading, bridging, ditching, and laying tracks and rails over a stretch of about 450 miles through the heart of the provinces of Santa Clara, Puerto Principe, and Santiago. Unless the work be blocked by the rainy season, August 1 should see a rail connection from Pinar del Rio, 100 miles west of Havana, to Santiago de Cuba, more than 500 miles east.

A unique difficulty was encountered at the beginning of this enterprise. The so-called Foraker Law of the American Congress prohibited

the granting of any concessions or franchises to individuals or corporations during the period of American occupation. In the face of this, Sir William van Horne and his associates began their work upon an enterprise which, before it is definitely concluded, may, in the words of Sir William, involve "twenty millions, thirty, fifty, or a hundred millions of dollars." It has been asserted that the work was, in fact, a violation or, at best, an evasion of the Foraker Law. That is not the case. It has complied with the law. That law prohibited concessions and franchises. The Cuba Company, as it is called, neither has nor has asked for either. It has bought lands throughout its intended route and has laid down rails and ties upon the lands thus bought. It has purchased a continuous strip of land some 450 miles in length and 30 meters in width. It obtained a revocable license to cross streams and highways, and thereby placed itself at the mercy of any government which might be established. It encountered obstacles in the shape of individual owners who refused to sell except at exorbitant figures. It encountered areas to which no owners at all could be found, and other areas of doubtful and complicated title. Upon its surface, it was a gigantic speculation whose outcome was exceedingly doubtful. Yet it went ahead, spending its millions along the way.

The laws, as they existed, gave the company no rights of expropriation. Those laws gave the right to construct railways upon private lands, and many miles of such railways were in operation upon the sugar estates, but they gave no right to operate them for public uses. Such roads could carry no passengers and no freight except their own. The company bought an existing line, of some twenty miles in length, running from Santiago northward to San Luis, and leased the military line which Spain built in connection with its line of blockhouses, trenches, and barbed-wire fencing, from Jucaro to Moron, in the hope of confining the insurrection to the area of its inception in the eastern part of the island. To the outsider, the whole scheme presented every sign of an extremely precarious undertaking. Newspapers attacked it, and various local politicians frankly declared their purpose to make the company open its check book whenever it should come into their power to regulate the laws of the island. But the company proceeded with its work, placating here and receiving support there, gradually and surely diminishing its opposition throughout the entire area of its operations. Its processes of construction put large sums of ready money into circulation in a region where it was greatly needed. While in that section a few weeks ago, a number of the leading

le told me that without the money which followed the work of the Cuba Company, it by no means improbable that the people of region would have been starved into a con- of revolt.

February 7, 1902, there was issued from headquarters of the military government an known as No. 34. This is unquestionably of the ablest railroad laws which was ever ed. It is concise, yet comprehensive. It acts both public and private interests, is in conception and extensive in scope. objection undoubtedly lies in the fact of the ion of so important a law by the American crities at a time so little preceding the day the Cubans were to undertake the control air own affairs. But its justification lies in merits of the law itself, and in the fact that it is possible the rapid prosecution of an enter- whose development constitutes, beyond all ion, the key to the future of the island of . The railway and development scheme of uba Company, in which English and Cana- capital is associated with American capital, open to settlement and productive cultivation rea, hitherto little more than a vast wilder- of twelve to fifteen millions of acres of the st land in one of the richest spots on the ce of the globe.

#### SUGAR PROPERTIES.

somewhat general circulation has been , within the last few weeks, to allegations certain interested persons are seeking to the economic destruction of Cuba in order they may purchase sugar properties in the l at prices far below the actual value of properties. While it is only too evident there is an effort on foot to effect annexation y and all means, creditable to the United s or otherwise, I cannot accept that inter- tion of the underlying motive. Such pur- s would involve large investment of capital. s who contemplate such investment are fully s of the fact that only a limited number of ready established estates would be in any a desirable purchase, in view of the much er advantages offered to the investor in a lands for plantations and the erection them of up-to-date grinding mills. Any er of the old estates can now be purchased most any price, and there have been few actions. Nor is there any probability that, r any circumstances, the virgin lands could ight at any lower prices than those which ow quoted. With the exception of a small er of estates, which the present owners can i to hold and operate, the opportunity for

profitable investment lies distinctly upon the side of the virgin land with the modern mill. Before many years, these will almost inevitably crush out a large number of the old estates. The new lands are available to-day at prices which offer no probability whatever of reduction, and there ap- pears no competent reason for forcing general disaster in order to purchase undesirable or less desirable properties.

The total of American investment in Cuban sugar production is to-day probably not far from \$40,000,000,—about equally divided between Cubans who have taken out naturalization papers and those who are citizens of the United States by natural right. Of the amount held by the latter class, about two-thirds is of a standing which antedates the insurrection of 1895. This is represented by such estates as the Constancia and the Soledad, both near Cienfuegos. These have been owned by native-born Americans for the last twenty or thirty years; \$7,000,000 to \$8,000,000 will probably fairly cover all Ameri- can investment in Cuban sugar properties since the Spanish evacuation. There is no doubt that many other millions are ready and waiting to move in if the movement be justified by political conditions and a fair market, particularly the latter.

The sugar industry is a business for large in- vestors. Renters or owners of comparatively small properties, located in the vicinity of the large "centrals," or grinding mills, find the production of cane a reasonably profitable enter- prise under normal market conditions as a cash crop. Many of the mills depend largely upon this source of supply. This is indicated by the fact that during the last season the number of mills in operation was about 160, while the num- ber of cane-growers, large and small, is estimated at from 18,000 to 20,000.

#### MINING ENTERPRISES.

Although many metals and minerals are in- cluded among the potential interests of Cuba, few mines of any importance have been developed thus far. As far back as the early days of Spanish settlement, the copper mines near Santi- ago, across the bay to the westward, were a source of supply, and they have been, in later years, a highly profitable investment. The war of 1868-78 stopped their operation for a time, and no extensive work has been carried on since that date. The numerous properties have now been bought up by American capital, represented by Messrs. Rand and Chanler, and they will soon be reopened. Some \$600,000 has already been expended, and it is probable that half a million dollars or so more will be laid out before

the mines are put upon a paying basis. There is no question of the value of the properties, and there is every probability that the enterprising gentlemen who are reopening the Cobre mines will find ample returns for their outlay.

The iron and manganese mines to the eastward and northward of Santiago have, since the cessation of hostilities, repaired their damaged properties, and are again in operation. The Spanish-American Iron Company, at Daiquiri, represents an investment of \$3,000,000 of American money. Its iron is of a highly desirable quality, and its output finds ready sale in the American market. The Juragua iron mines represent another \$1,500,000. This has been a prosperous affair, but its ore now shows signs of exhaustion, and its shipments are greatly reduced. The Sigua iron property swallowed some \$2,000,000 of American money, with no returns. The Guama mine has absorbed about \$1,500,000, and is not remarkable for its promise of revenues.

Three manganese mines are open in the same district. The Panupo represents \$500,000, and the Cuban Manganese Company and the Standard represent \$250,000 each. Work is being carried on, and the proprietors are hopeful of ample results. Some 200 other mining claims are located in the same region, but they are as yet in the form of claims only. Some may develop into paying properties, but the greater number will probably remain as prospect holes and nothing else. In other parts of the island claims have been filed, and talk may be heard of undeveloped possibilities of great wealth. Here and there some mine may pay. But the great riches of Cuba will be found in that which will grow out of the soil, and not in that which lies beneath the surface.

#### FRUITS.

Some money, particularly that of the United Fruit Company, has gone into lands for fruit growing. This company has acquired extensive plantations on the northeastern coast. Bananas will constitute a large portion of their merchandise, and there is ample assurance that the locality will prove a marked advantage over Jamaica and Central America. Eastern Cuba may well grow all of the bananas and cocoanuts that can be consumed in our Eastern market. In several sections, notably in the vicinity of Havana, Americans have bought tracts, some large and some small, for the cultivation of oranges, pine-apples, and vegetables. The greater number of these have met with fair success, and the industry offers many inducements to those of small means who are willing to back their capital with due intelligence and hard work.

#### TOBACCO AND OTHER INTERESTS.

Nearly three years ago, the Henry Clay and the Bock & Co.,—large cigar manufacturing concerns,—effected a consolidation of interests and bought up a number of other factories. The capital was English. American capital,—some \$6,000,000 in amount,—sought a similar consolidation through an organization known as the Havana Commercial Company. This absorbed a large number of the factories which had not been taken in by the Henry Clay-Bock combination. Both of these organizations paid very high prices for the concerns which they purchased. During the month of May last, there was incorporated under the laws of New Jersey a combination known as the Havana Tobacco Company. It is a branch of the so-called "Tobacco Trust," and its capitalization provides for \$30,000,000 of common stock, \$5,000,000 of preferred stock, and \$10,000,000 in bonds. This organization takes over the Henry Clay-Bock combination, the Havana Commercial Company, and the Cabanas factory, thus giving it control of much the greater part, and practically all of the important part of the Cuban cigar and cigarette trade. Its greatest success depends, naturally, upon the establishment of favorable trade relations between Cuba and the United States. As revision of the American tariff, if not the annexation of Cuba, seems inevitable at some early day, there is sound reason for belief that those who control so large a percentage of the limited output of the choice Vuelta Abajo tobacco are well in the way of ample dividends, notwithstanding their payment of large prices for their purchased properties.

The business of these companies is confined to the manufacture of cigars and cigarettes. The leaf-tobacco business of the island shows no located American capital, although the United States is a large purchaser of Cuban leaf for admixture with American leaf in the manufacture of that which we know as "domestic" cigars. Purchases of leaf for American account and shipment are made by visiting or by resident buyers.

A few Americans have settled in the tobacco regions and engaged in the cultivation of the Cuban leaf. At present there is little room in that line; but if the American market shall become open to the cheaper grades, there are considerable areas in which there is ample promise. At present, these grades are completely barred from the American market by a tariff of some 300 per cent. *ad valorem*.

It is impossible in the limited space of a magazine article to review in detail the various existing and projected enterprises. Foreign

partly American, has purchased the street-railway system of Havana, and is planning extension in and around that city and construction in other cities. At present Havana is the only city on the island having street-car service. The telegraph system is a government institution, inherited from Spain, and improved and extended by the Signal Corps of the United States army. Telephone systems are in general use in the cities and in many of the larger towns. Banking facilities are ample in the principal cities, but an efficient system of country banks is greatly needed. With the establishment of a general government, and of municipal governments, upon a sound financial basis, there must come a large amount of contract work, notably in the line of sewer and pavement work and in harbor improvements. The country will also need public buildings and school buildings. But all of these must wait for a reestablishment of productive industry as a basis for national and municipal revenue.

Americans have gone to Cuba with various minor interests representing, in their aggregate, several millions of dollars. These have met with varying success. A few have gone into commercial lines, but, as a rule, their trade has been chiefly confined to the American residents. The greater number of those who have essayed retail trade have made a failure of it. The Spanish merchant is a difficult competitor. Some have opened offices in professional capacities, as doctors, lawyers, dentists, etc. Americans have opened hotels, barrooms, and boarding houses. American real-estate agents and speculators are also in evidence.

#### CUBA'S INDUSTRIAL FUTURE.

Cuba should not be overlooked as a great field for legitimate enterprises, well and conservatively managed. The failure of many thus far should not be discouraging, inasmuch as their mishap is undoubtedly due to lack of tact or to an absence of sound business methods. It is much to be hoped that the island is now done with the promoter who has no money, but who hopes for a profitable sale of the option which he obtains by such methods as are the custom of his kind. The same is to be hoped regarding the man who goes to Cuba to introduce ice machines or to establish electric-light plants, carrying with him an idea that Cuba and Darkest Africa are correlative terms. Much is said about defective land titles in Cuba. There need be no apprehension on that score if one retains, as he should and would at home, a duly competent legal adviser. Most of the titles are, or can be made, good and clean. Those which are defective are, for the

present, beyond redemption. Under the system of registration employed in the island the question of titles is settled with little difficulty.

Cuba will reach her highest development when she becomes a land of small farmers, with such diversity of products as is readily possible with her soil and her climatic conditions. For years sugar and tobacco have been her great industries. With freer access to the American market, there is no reason why these should not attain much larger proportions than they have yet reached. But Cuba must and will diversify her products. Many very promising lines are open to investors of large or small capital. The labor problem presents a serious difficulty, and no greater mistake could be committed than that of the imposition of any immigration laws which would prohibit or limit the incoming of men and families from the Canary Islands and from certain Spanish provinces. These form the best, most suitable, and most desirable element that comes to the island. The Cubans do not want "coolies" any more than Americans do. They do want and need those who would, in large numbers, be shut out by the unmodified application of the American immigration laws.

The "bonanza" days of sugar raising are past. Under any reasonable trade treaty, or even under free trade, the industry would find but a duly normal development. Its extension will depend far more upon an influx of a class of immigrants physically capable of doing the necessary field work than it will upon the readiness of capital to invest in the business. With its present equipment, the island can produce little if anything beyond 1,200,000 tons per year. The doubling of that output would involve an investment of some \$250,000,000 and a large increase in the population. It will be many years before such a combination of capital and labor will be in any danger of glutting the world's market with Cuban sugar. The areas of possible cultivation of the unique Vuelta Abajo tobacco have been fully occupied for many years; but, if given a market, there is room for a vast extension in the production of less valuable but still desirable and readily marketable grades of the weed. With the increase of these two major products, and with the extension of transportation facilities and a due reduction of the present exorbitant rates of transportation; with settled governmental conditions and ready access to the markets of the United States; and with the opening for productive cultivation of those vast areas of middle and eastern Cuba, that Cuban Question, which has intruded itself into American politics for the last hundred years, will be definitely settled, and Cuba will be again the Pearl of the Antilles.

# THE CUBAN MUNICIPALITY.

BY VICTOR S. CLARK.

WHEN our officials assumed the administration of Spain's former colonies, they found in existence a local political unit unfamiliar to their past experience. Many were probably unaware how very distinct from any homologous division in the United States was the Spanish municipality which they then encountered. Yet it had existed continuously in the New World since the time of the discovery, with only such changes as were necessary to keep it in harmony with the institutions of the home country. Its ancestry, traditions, and theory of government, however, were not only different from those of an American township or county, but they represented a line of political development that had begun to diverge from our own centuries before the Christian era.

The Cuban municipality is a lineal descendant of the Roman municipality, which in turn was a product of a Mediterranean civic culture extending back to the days of Troy and Pergamum. The Græco-Italic civilization was urban, and during its long continuance the historical precedence of the rural to the city community was forgotten. The city was regarded as the primary element of the body politic. It ruled the country like a possession or a piece of property. Such a civilization could not develop representative government, which is essentially the political machine of a scattered rural population undominated by any urban center. Rome's easy conquest of the ancient world was partly due to this feature of its political organization. A city could not evade her armies, and when she had once mastered this central ganglion of civic activity all the coöperative life of the dependent territory was paralyzed. The rural organization of the Teutonic tribes was a barrier to her progress. It is from Rome, who in turn borrowed from her predecessors, that we get the theory and methods of centralized administration, which, applied to local government, produce the Cuban municipality. With us, on the other hand, the primary cell of the body politic is the rural community. The local unit is the depository of all residual authority, and in it originate the ultimate motor impulses of government. We may not formulate this thought clearly in our minds, but unconsciously we accept and apply it in our political reasoning. It is not strange, therefore, that the municipal system of the Spanish colonies was unfamiliar, in both form and theory, to our administrators.

## SURVIVALS OF THE ROMAN SYSTEM.

The municipality in Spanish times was essentially an imposed government. Its authority was derived and its activities were directed from above. Sometimes it was principally a taxing unit, instituted primarily for fiscal interests. During the decadence of the Roman Empire municipal officials were made personally responsible for the imperial revenues of their locality. It was obligatory to accept appointment to these unwelcome dignities, and many a subterfuge was adopted by the wealthier residents of the provincial towns to escape honors that often imperilled their private fortunes. In this respect history repeated itself in Spain's colonies. A native work on Philippine customs tells us how a municipal officer loses his patrimony through the expenses of his office, and another involuntary appointee finds his property bonded to the treasury of the state against his will for the fulfillment of his official obligations,—which consisted of wringing a certain sum of taxes from his fellow townsmen.

The judicial functions of the municipal governments early assumed prominence. The name of the principal city officer—the *alcalde*—is the Arabic word for judge, the familiar *el cadí* of the "Arabian Nights." Court fees once made these offices very lucrative. They were sold or granted, like English church livings, to wealthy subjects, and until quite recently were disposed of by auction. It was not until 1844 that this practice of selling municipal offices to the highest bidder was entirely discontinued in Cuba.

## CUBAN CITY COUNCILS IN EARLY TIMES.

The earliest Cuban municipalities date from 1540. They were formed after the precedent of Spain's mediæval cities, with an *alcalde* and city council, the latter often known in those days as the *cabildo*. For several hundred years these local bodies were vigorous, and possessed considerable authority. The Cuban *cabildos* made grants of their *hinterland* to private petitioners, and exercised other property and judicial rights almost like independent colonies. Some of the city councils in South America actually levied war and instituted rebellions. Spain promptly discouraged such an exuberant exercise of local powers, however, and succeeded in making the councils merely administrative bodies. In 1859, ten of the thirty-two towns of Cuba were in

municipal committees, which consisted of a legal officer and two advisers. The principal functions at this time were nominal as at present, and included the supervision of police, primary education, health, and public improvements. Sanitation was so neglected that Trinidad, with fifteen thousand inhabitants, had no public water supply, schools, charities, or police. The only public enterprise was street lamps supported by private subscription. Similar conditions prevailed in San Juan. The police received no regular salary, but were paid by a share of the fines collected from persons arrested by them and from certified extortions. There was no local public improvement except a carriage road, the proceeds of which were devoted to paving.

#### GOVERNMENT BEFORE AND AFTER THE WAR.

The municipal government in Cuba dates from the ten years' insurrection, in which the organic municipal laws of Spain were introduced to that island. It was this form of government, very slightly modified by royal decrees and administrative decrees, that was found in operation in Cuba. The insurrection instituted a number of changes, many of which relate to elections. Some municipalities were also created in the interest of economy, having been unnecessary in Spanish times to appeal to the peninsula politicians. The constitution contains a municipal law, in a broad way the relations of the municipality to the other governing powers and its form of government. This title is intended so as to guarantee local autonomy as exists in the United States, but any retention by superior authority must be by some violation of the constitutional laws and confirmed by a judicial

constitutional provisions place the municipality upon a new basis—Anglo-Saxon in origin and make them the depositaries of original

As yet this change is only nominal, and many of the untried municipal administrations with the new responsibilities in no means demonstrated. The constitution further provides that Congress can determine the methods by which the municipalities exercise their powers through general legislation, which quite possibly lead to a retention of power by the central authorities. It is intended that old habits of administra-

tion and political thought will assert themselves to make the local governments less independent and spontaneous than in our own country.

#### PRESENT FUNCTIONS OF "ALCALDE" AND COUNCIL.

Until the Cuban Congress enacts laws supplanting those in force, the details of municipal organization and administration will be regulated by the Spanish municipal code, as amended by the orders of the military government. The constitution provides for a municipal council and *alcalde* elected by direct vote, and gives the council authority to decide all matters relating exclusively to the municipalities, prepare budgets, provide necessary revenues, contract loans, and appoint and discharge employees. The *alcalde* is an executive officer, with a qualified veto upon the legislation of the council. Every municipality is a judicial district, and justices are elected at municipal elections and paid from the municipal budgets. Other officers have no judicial functions.

#### WARDS AND DISTRICTS.

A municipality consists of a town and a surrounding rural district. The area of the latter may vary from a few square miles to that of one of our larger counties. It may itself include villages of considerable size. The municipality is divided into wards or *barrios*, each of which has its ward mayor, who performs administrative functions under the direction of the mayor. He is appointed by the latter from among the residents of the ward, and is not a member of the municipal council. Several *barrios* form a sub-district of the municipality and have at their head a deputy mayor, who is elected by the council from among its members. There is a third municipal subdivision, the electoral district. Councilmen are residents of and represent these. Their limits are determined by the municipal council. Provision is made for minority representation by allowing no elector to vote for the full number of councilmen representing his district. For instance, if there are four aldermen to be chosen,—which is the most usual number,—he can vote for but three of the candidates. The councils are renewed by half every two years.

#### MUNICIPAL FINANCES.

General taxes are assessed by a board consisting of the municipal council and an equal number of citizens drawn by lot from lists of representative taxpayers. This board also authorizes new taxes and audits municipal accounts. Incomes from real property are assessed at practically their actual value, though an order of the Spanish council required that they should be estimated

at one and a half times the rent in case of rural estates. Plantation crops for occupants' consumption are not included in reckoning incomes. The maximum legal tax rate varies from 6 to 12 per cent. on urban property, and from 2 to 6 per cent. on exclusively agricultural property, according to locality,—the rate being highest in Havana and vicinity. Sugar plantations containing mills pay 8 per cent.

The aggregate revenue of the Cuban municipalities during the last fiscal year was \$4,270,000, of which \$1,349,000 was derived from the tax on incomes from land and improvements, and \$1,262,000 from the tax on industries and occupations. In the order of their importance the other sources of revenue were,—water service, \$359,000; income from municipal property, \$321,000; abattoir fees, \$297,000; liquor consumption tax, \$183,000; and fines and penalties, \$110,000. The remaining \$389,000 was raised from sixteen other sources, the two most important of which were a carriage and transportation tax and a license fee required of peddlers and vendors in the public highways. Urban property pays \$1,034,000, and rural property pays \$315,000 of the territorial tax. The military government has suppressed the consumption taxes on food, which were formerly a main reliance for local revenues.

The liquor business contributes the largest item to the industrial tax. There are 4,797 drink shops in Cuba, which pay an aggregate tax of \$122,375. Next in order come 123 banking houses, paying \$75,675; 1,482 general stores, paying \$69,508; 485 pharmacies, paying \$41,690; 776 cafés, paying \$36,208, and so on through the 236 minor industries included in the assessment rolls. Formerly the collection of taxes was farmed out to the highest bidder, but this practice has been stopped by the military government, and they are now collected by public officials.

Since the war the general treasury has paid an important share of the municipal expenses. This amounts at present to nearly \$1,500,000, and includes in round numbers \$1,250,000 for public schools, \$150,000 for hospitals and charities, and \$50,000 for jails, besides such assistance as may be given for local sanitation and public works. The expenses charged to municipal revenues are \$1,075,000 for administration, \$1,225,000 for police, \$700,000 for the support of municipal services,—such as street lighting and cleaning, parks, and cemeteries,—and approximately an equal sum for pensions, subventions, and interest. Over \$614,000 of this last item is repre-

sented by interest and amortization of Havana city bonds. Nearly \$118,000 is expended for jails, \$125,000 for public improvements, and \$40,000 for municipal charities.

#### MUNICIPAL DEBTS.

Of the 128 municipalities in the island at the close of the last fiscal year, only 36 had standing debts of any kind. Exclusive of the city of Havana, which had \$10,000,000 (Spanish gold) six per cent. bonds outstanding, there was no bonded indebtedness, and the total interest charge was less than \$5,000. Most of this was represented by *censos*, or permanent annuities charged against estates that had in one way or another become city property. Some of these annuities return to the municipal treasuries as income from the endowment funds of municipal schools and hospitals. The total floating debt of all the municipalities was \$170,000, against which the local treasuries held \$152,000 in cash and \$542,000 in credits for back taxes and other unpaid revenues.

#### THE MUNICIPALITY AS A SCHOOL IN SELF-GOVERNMENT.

The political capacity of a whole nation is demonstrated by its local more than by its general government. The Spanish immigrants in Cuba show greater talent for self-organization,—judging by their clubs, labor unions, and co-operative societies,—than the natives. Cuba might therefore appear less fitted than Spain to create a system of vigorous local autonomy. But we must allow for the reaction of the general upon the local government and for the communication of political ideals and methods from the United States. Both of these influences may have a far-reaching effect upon the municipalities, and is already predicted in the new constitution. Many abuses will certainly arise. The *cacique*, or boss, will flourish upon misappropriated funds and authority. It will be a slow task to instill in the mass of Cubans an intelligent conception of even primary civic obligations. This must be done principally through the concrete and local interests of the municipality,—not only in Cuba, but in Porto Rico and the Philippines. Therefore it is not as an instrument of administration, for here its effectiveness has already been tested, nor as an organization for coöperative and social enterprise, for these functions are as yet largely undeveloped, but as a school for the elementary political education of a people that the Cuban municipality assumes new importance with the birth of the republic.

# THE NEW PORTO RICAN LAW CODES.\*

## CONTACT OF THE SPANISH WITH THE AMERICAN LEGAL SYSTEM.

**I**N the discussion aroused by our annexation of Porto Rico and the Philippines, public attention has been concentrated upon the form of government to be given to these new possessions. The unique character of the juristic questions arising out of our contact with the Spanish-American civilization seems to have escaped attention. The report of the Porto Rican Code Commission, which has just been issued from the Government Printing Office, throws an interesting light on the relation between the two systems of law, and furnishes the basis for a closer harmony between them. In order to judge of the commission's completed work we must consider the two reports, which have been issued almost simultaneously. The first commission,—consisting of Joseph F. Daly, of New York; L. S. Rowe, of Pennsylvania; and Juan Hernandez-Lopez, of Porto Rico,—was appointed by President McKinley pursuant to a provision of the act of Congress of April 12, 1900. The term of this commission expired in April, 1901, when it was succeeded by a commission appointed by the Governor of Porto Rico. The *personnel* of the second commission was practically the same as the first, except that the Hon. J. M. Keedy was substituted for Judge Daly, and Dr. L. S. Rowe was made chairman of the commission.

The plan adopted by the first commission, as shown by the report, was to deal with the immediate and pressing reforms, without attempting a general revision of the Spanish codes. The second report, which covers the work of the commission from April 12, 1901, to January 1, 1902, and which is published by the Porto Rican Government in eight volumes—four in English and four in Spanish—contains a systematic revision of the Civil Code, the Penal Code, the Code of Criminal Procedure, and the Political Code. Most of the recommendations of the first report have been embodied in the codes prepared by the second commission.

\* Report of the United States Commission to Revise and Compile the Laws of Porto Rico. Parts I., II., and III.—Commentaries on Proposed Revision. Parts IV. and V.—Text of Revision.—Washington, Government Printing Office.

Report of the Insular Code Commission, San Juan, Porto Rico.

Introductory Volume.—Commentary on Revision.

Volume I.—Revision of the Civil Code.

Volume II.—The Political Code.

Volume III.—The Penal Code.

Volume IV.—The Code of Criminal Procedure.

The most important question to which the first commission addressed itself was the revision of the organic act of Porto Rico. The measure as drafted by Congress was in many respects fragmentary, especially in the sections dealing with the organization of the executive and judicial branches of the government. Congress evidently did not fully realize that, in a country with laws and traditions essentially different from our own, the organization of an administrative department cannot be effected by reference to institutions established in the other Territories of the United States. For instance, in the section relating to the attorney-general of Porto Rico, the Foraker Act provides that the attorney-general "shall have all the powers and discharge all the duties provided by law for an attorney of a Territory of the United States." The restricted duties of an attorney of a Territory are not sufficient to meet the requirements of a densely populated island accustomed to a system of administration under which the attorney-general is the head of a complex judicial system,—a kind of minister of justice. The same is true of the other heads of executive departments.

In the revision of the organic act the commission was compelled, therefore, to formulate with great detail the powers and functions of executive officers. On the question of the organization of the legislative branch of the government the recommendations of the commission are divided. The majority favors the introduction of a bi-cameral elective assembly modeled after the legislatures of the Territories. The minority advocates the retention of the present system,—an appointive upper house and an elective lower house.

### ROMAN LAW NOT DISCARDED.

As regards the system of private law, the recommendations of the commission possess a peculiar significance. In Porto Rico we have, for the first time, come into direct contact with the Spanish system. It is true, that in both California and New Mexico we find the Spanish law in force, but it soon gave way to the American system, and the influence of the Spanish inhabitants was rapidly overcome by the influx of immigrants from the East and North. In Porto Rico, however, we have to deal with a densely populated island which, because of climatic con-

ditions, will never attract a large number of persons from the North. The system of law must, therefore, always remain in close harmony with the inherited ideas and traditions of a population essentially different from that which we find in the States of the Union. Both reports furnish ample evidence that the commission realized the danger of attempting to force upon the people of Porto Rico a new system of law which would be certain to arouse a feeling of distrust and resentment in the native population.

It is furthermore evident, from the commentary contained in the report, that considerable pressure was brought to bear upon the commission to sweep away the Spanish system at one fell blow, and to substitute for it the codes of one of the States of the Union. In this attitude toward foreign systems of law there is involved the most serious danger incident to the contact with civilizations different from our own. The training of the American lawyer is in the common law. Little or no attention is given to the great body of civil or Roman law, which is at the root of the legal systems of Continental Europe and of the entire South American continent. This ignorance of foreign systems explains the feeling, so prevalent at the bar, that any system other than the common law is unable to meet the requirements of justice. We are not always mindful of the fact that the Roman law exercised a marked influence on the development of the common law, and that during the last two centuries there has been a gradual approach of the two systems toward a common standard, especially in the law of commercial relations.

#### THE CIVIL CODE.

In the Civil Code, the points of contrast between the Spanish and American systems relate to the most delicate parts of the structure,—namely, the law of inheritance and of domestic relations. The theory of the family evolved in the English system of jurisprudence, and upon which our law rests, is based upon the principles of individual liberty and individual responsibility. The father's legal obligation toward his children ceases at his death, just as his power over them terminates with their majority. Under the Spanish law, the principle of family solidarity and parental authority is emphasized. The *patria potestas*, while greatly circumscribed, does not cease when the child becomes of age. The family as the social unit is the basic idea of the system, and in the logical development of this principle the obligation of the father does not terminate with his death. The children are given a legal right to a certain share in the estate, and can only be disinherited for certain

reasons specified in the law. It is evident that such a system, whatever its merits or defects, cannot be swept away without unsettling domestic relations. The commission has retained the feature of the Spanish law which gives to children the right to a minimum share in the estate of their parents. In the revision of other portions of the code the same conservative spirit has prevailed.

#### THE PENAL CODE.

In dealing with the Penal Code the commission was able to act with a freer hand in both the substantive law and in the law of procedure. The Spanish system, which was largely influenced by the earlier Italian codes, is out of touch with modern standards of criminal jurisprudence. It bears the earmarks of the period of class privilege, and, as applied in Porto Rico, many of its provisions presuppose the existence of slavery. Its primitive character is furthermore illustrated by the fact that, while offences against the person are treated leniently, offences against property are visited with a punishment both harsh and cruel.

The system of criminal procedure is, if possible, even more antiquated than the substantive law. It gives to the courts and the law officers of the government a measure of discretion in dealing with accused persons which leads to the worst forms of tyranny and oppression. The *incomunicado*, by which the accused is isolated and subjected to every device that cunning can devise in order to extract a confession, is the first step in the administration of justice. The extraordinary power and influence given to the district attorney, or "fiscal," tends still further to strengthen the position of the prosecution. In the actual conduct of the trial the accused is first put on the stand, and the attitude of the district attorney naturally places him in a position in which he must prove his innocence. The "presumption of guilt," of which so much has been said, is not to be found in the law itself, but rather in the position in which the accused finds himself by reason of the manner of conducting the trial.

In the revision of the Penal Code the commission evidently determined to bring the Porto Rican system into close harmony with American standards. The code submitted, which is now in force in the island, is constructed upon the same principles as the penal codes of California and Montana, which, in their turn, are based upon the David Dudley Field code. While the change is radical, it cannot be said to involve any danger to the orderly development of the legal institutions of the island. The only possible hardship involved—if such it be—is the necessity

imposed on the native lawyers of acquainting themselves with a new code. To the people, as a whole, the new system cannot help but work great benefit, as it assures to the ignorant and helpless *peon* effective guarantees against the arbitrary acts of the officers of the minor judiciary.

#### THE POLITICAL CODE.

The fundamental and irreconcilable differences between the Spanish and American administrative systems forced upon the commission the task of formulating a political code. In the early stages of civil government in Porto Rico, great inconvenience was caused by the uncertainty as to the relation of the Spanish law, which was continued in force by the Foraker Act, to the new administrative system introduced by the establishment of civil government. The political code prepared by the commission, which, with important modifications in the chapters on elections and local government, was adopted by the Legislative Assembly at its last session, covers the entire field of administration. The subjects treated are: Jurisdiction over Persons and Property, Citizenship and Domicile, the Political and Judicial Divisions of Porto Rico, the Legislative Assembly, Executive Officers, Judicial Officers, General Provisions Relating to Different Classes of Officers, Nominations for Insular and Local Officers, Elections, Local Government, Public Safety and Police, Education, Highways and Roads and Public Works, Revenue and Taxation, Miscellaneous Provisions, and the Insular and Local Civil Service.

The most serious question that presented itself was involved in the possibility of assuring to the towns a larger measure of local self-government. The Spanish system is one of extreme centralization, the Governor-General and his agents maintaining minute control over local officials, and to a very large extent directing local policy. No opportunity was therefore given for the development of that local initiative and energy which is indispensable to the smooth working of a decentralized system.

The general principle which has guided the commission throughout the formulation of this code is to place the initiative and the primary responsibility for the performance of local services upon the town officials, but at the same time to reserve to the central government sufficient control to guarantee a definite minimum of efficiency. The code recognizes the fact that the qualities requisite for the successful working of a system of self-government are not of spontaneous growth, but are the result of painfully acquired experience, and of the gradual strengthening of national character.

The fact that the commission, while proceeding in a conservative spirit, has nevertheless succeeded in bringing the Spanish system into harmony with American standards, is at tribute to the elasticity of our institutions. The test is one that we shall have to meet on a far larger scale in the decades to come, and it is well that in our first contact with the new situation the conditions, both political and economic, have been so favorable to a successful issue.

## AMENITIES OF CITY PEDESTRIANS.

BY LOUIS WINDMÜLLER.

**N**O corporal exercise is better adapted to promote health, none more reluctantly practiced, than walking. Americans will patiently suffer the indignities that public vehicles inflict rather than move their feet. They use cars which are close in winter, draughty in summer, to bring them from airless workshops, where they have passed their day, to spend the night in unventilative homes. Ask for directions in any city and you are carefully told what trolley will convey you. When you inquire how to reach your destination afoot, the same courteous stranger is apt to leave you without reply, but with a suggestive shrug of his shoulders; the man who persists in walking where he can ride is considered a fool.

The tortures endured by frequenters of the

trolleys of cities during "rush" hours are excruciating; many passengers could lessen by their absence the pressure, if they would walk all reasonable distances. They rather permit insolent conductors to elbow and jostle them, in a crowded car which jerks at every stop and turn with such violence that hapless strappers are huddled together, or thrown on the knees of compressed sitters, while they must listen to the familiar ejaculations: "Move forward," "Step lively," and "Fares." The pedestrian, independent of motors, strides over comfortable sidewalks and looks with complacent pity on the, often slowly, passing victims of their indolence.

Avenues like "Commonwealth" in Boston, "Delaware" in Buffalo, which are beautified by art or nature, are practically deserted, while the

"Champs Elysees" in Paris and the "Thiergarten Strasse" in Berlin are frequented by appreciative promenaders. Our parks,—"Central" in New York, "Lincoln" in Chicago, and "Fairmount" in Philadelphia,—are chiefly patronized on fine Sundays, by persons who at other times are confined in tenement-house districts. In those retreats they refresh their eyes by the verdure of vegetation and their brains by freedom from agitation. City lungs are a blessing to the poor, who would not find their equal on country highways, if they could reach them.

We may enjoy the beauty of virgin nature in secluded forests when we climb mountains; but the gratification becomes tiresome when we find nobody to share it. Even Mr. Burroughs has been obliged sometimes to content himself with the company of his faithful dog. A comrade is always welcome but not indispensable in streets, where the pleasure of exercise is heightened by ever-changing sights and sounds. The most harmonious cries of street venders are less sweet than the melodies of singing birds; flowers that greet us from windows of houses lack the fragrance of nature. But I consider the melodious chimes of city churches preferable to the thunder of Niagara, and the friendly look of a charming woman to the vista from Pike's Peak. Dickens found in every street of London a subject worthy of description by his marvelous pen; personal observation enabled Victor Hugo to delineate the old streets of Paris, as if he had lived at the time of Quasimodo.

Most Americans dress on streets as they do at home. Even in Washington, uniforms are conspicuous by their absence. I remember that policemen and railwaymen objected against donning such "livery" until public-spirited citizens, to demonstrate that it would not degrade them, wore it at public functions. But on the streets of Continental Europe uniforms are in evidence wherever you go, and of the young wearers too many are inclined to swagger.

It is amusing to watch the promiscuous variety of teams that pass through our thoroughfares,—beer wagons and trucks, ambulances and fire engines, freely intermingle with autos, and in many streets predominate; while in fashionable thoroughfares and parks carriages are in the majority. Vehicles used for business purposes are seldom prohibited in a country ruled by business men. On "Rotten Row" in London, the "Cascine" in Florence, a hired hack is not tolerated. Private conveyances and riders absorb the driveways, promenaders the sidewalks.

In no other cities do we find buildings of such different architecture as on the busy streets of Chicago and New York. Squatty houses, built

long ago for residences, have been altered into warehouses, or are being demolished to make room for modern structures; interplaced between them and the storehouses of a past generation, often overshadowing them, are the tall buildings called skyscrapers, that give to narrow streets, where they prevail, a gloomy appearance and a baroque aspect to the rest. The monotonous uniformity of brownstone and brick houses in residential thoroughfares is gradually changing, by the erection of a variety of "American basement" dwellings of a modern and more cheerful exterior.

To "dress" windows of retail shops with seductive taste, an accomplishment the practice of which has always prevailed in Europe, has become more general here; a small dealer is wont to place the best part of his stock with exquisite consideration of color and symmetry on revolving glasses in his showcase, before the astonished eyes of a passing stranger, and thus allure him to enter. The signs which French shopkeepers display are more attractive than ours. Lately shrewd Parisians have returned to the ancient habit of employing artists to design, sometimes to execute, them. This gives to ambitious painters an opportunity to demonstrate the skill of their brush, and makes the thoroughfare more attractive.

The street of one city differs from every other; and almost every one has, to the pedestrian, a peculiar charm of its own. We must not look from the tops of 'buses nor from the windows of cars if we want to know and appreciate an interesting way,—we must measure its length with our steps. On Market Street, San Francisco, we meet the original types of our slopers, and freeze on the shady side while we broil in the sun on the other. On Canal Street, New Orleans, we admire the fashions and gait of Creole beauties, and wonder at ships that lie on the elevated Mississippi, above the surface. The "Nevsky Prospect," in St. Petersburg, is crowded with *drogkies* rapidly driven by unkempt, unwashed Tartars, dressed in long kaftans. On the "Grande Rue de Pera," the only street in Constantinople where we can walk with a certain degree of comfort, we meet almost every human type of the Orient and Occident; but encounter not as many canines as formerly, nor as many as continue to hover on the crooked alleyways of Stamboul.

Method will add to the satisfaction of walking. When I pass an organ or a band of music, I love to measure my steps by the notes I hear; where none are audible, I rehearse those I happen to remember myself. Half a century ago, when I returned with my class in rank and file from an

outing, we kept step to the tunes of some favorite college song, like "Guadeamus;" I have continued this habit, humming any tune adaptable to my step, like "Yankee Doodle" and the stirring battle hymn of Julia Ward Howe. Going with ease, at the rate of three miles an hour, I breathe through my nose to filter the air that enters my lungs and give full play to my swinging arms. I exhale on the second double step the air I inhaled on the first, and lean the back of my neck against my shirt collar, to look into a blue sky or gray clouds, when I veer my eyes from the turmoil of the immediate surroundings.

The Latin advice, "*Post coenam stabis seu passus mille meabis*," I modify by resting after every meal. It is pernicious to strain an overloaded stomach, and I would rather go without food than without walk. Obstacles increase the pleasure, vexations cannot dampen the ardor for the luxury I covet most. Rain or shine, in every degree of heat or cold, I go, when feasible, several hours a day,—twice as long when my spirits are depressed. In warm weather it may increase perspiration, but that is a discomfort which must willingly be borne. H. W. Beecher said: "There are many troubles which you cannot cure by the Bible or hymn book, but which you can cure by perspiration and fresh air." External gymnasiums are scarce; golf and most other outdoor plays require some exertion of the brain. But when we walk we can give the mind a complete rest, and graduate our effort according to our strength. Let those who are feeble walk, at an easy gait, half a mile,—when their muscles strengthen, a mile,—and they will soon find the exercise a pleasure instead of a penance; it will dispel the gloom which they hugged, and their aches will vanish. Air is man's element; he has no more excuse to refrain from walking through it than a fish would have from swimming in water.

The ruddy cheeks and stalwart figures of policemen, the bright eyes and elastic step of letter carriers, demonstrate the healthfulness of their calling; those whose occupation compels indoor work, like typesetters and tailors, look pale and haggard.

The idle tramp is happier than the busy millionaire; still happier are those who go forth with a distinct aim,—physicians to help the sick, ministers to console the afflicted. The ambulating journeymen of Germany belonged to this class. They formed associations for mutual help and protection. When an apprentice had served his time and was admitted to a guild, he shouldered his knapsack and wandered from place to place over the continent trying to find work. Where he found none the poor traveler was en-

tertained free of charge in the hostelry of his craft. Not all were as pretentious as the "Hotel des Brasseurs," the brewer's hall on the market place in Brussels. But all were equally hospitable. When work had been found and finished, he continued his journey with a light heart; as soon as he had acquired sufficient experience and saved enough money to marry, he established himself as "Meister," master of his trade.

A banker, troubled with gout, was obliged yearly to go to Saratoga. Having lost his fortune, he became a broker to support his family; going from house to house, from morning until night, he solicited the orders of his former associates. This proved to be a more efficient cure than water; the gout disappeared, he became healthier and stronger than he had ever been. Another friend, who daily walked to his town office, retired with a competence from active business. He built a manor house on a vast estate, and filling his stables with horses and carriages, he exercised his roadsters to keep them in good condition, but failed to exert himself. Rolling wherever he wanted to go on the luxurious cushions of his vehicles, his blood ceased to circulate, and he lay down to die.

The common excuse of those who preach but fail to practice exercise is want of time; in pursuit of fortune or power they forget their well-being and shorten their days more than they would require for the proper care of their bodies while they live. Pedestrians should combine and form federations like the "League of American Wheelmen," for mutual protection and encouragement.

Successful authors, men of thought, have been fond of the practice: Walter Scott walked fifteen miles a day, James Russell Lowell never rode where he could walk, William Wordsworth found his promenade more exhilarating than old port. The chief editor of a large daily newspaper marches five miles every night to his distant home, when, at 1:30 in the morning, he leaves his office. President Roosevelt is an ardent walker.

Habitual walking, combined with diet and other corporal discipline, promotes digestion and inhibits dyspepsia. Obesity, with its consequences, has no terrors for a pedestrian; he can never be troubled with paralysis or apoplexy.

For every ailment, activity in the open air is a more effective remedy than Christian Science, more reliable than patent medicine, and more soothing than physicians' advice. Fitting a sound body to a sound mind, it pacifies a ruffled temper and clears the tired brain of cobwebs.

## LEADING ARTICLES OF THE MONTH.

### THE LEADER OF THE MINE WORKERS.

**I**N the August *McClure's*, Mr. Lincoln Steffens has a brief and very eulogistic sketch of John Mitchell, the President of the United Mine Workers, who is the leading figure in the anthracite coal miners' strike.

Mr. Steffens says that Mitchell was against the strike at the beginning; that he thought the hard-coal miners' organization was too new, and that it was composed too largely of men who were foreigners, and who had not yet learned their lesson of self-restraint and sound principles. So Mitchell was overruled.

Mr. Steffens says, moreover, that Mitchell was decidedly against calling the convention to consider the question of calling out the bituminous miners. The soft-coal workers are under contract, and Mitchell, who had contended in the steel strike that Shaffer had made a mistake in allowing strikers to break contracts, kept the call for the Indianapolis convention in his pocket for six weeks because he believed it was unbusinesslike to consider at all the calling out of the bituminous men, who were satisfied, and working on a basis they had agreed to work on with their employers. He hoped that a settlement could be made in the interval. Mitchell's final action on July 17, in advising the bituminous miners not to strike, is fully in line with Mr. Steffens' ideas of the labor leader's high standards and purposes.

#### A NEW TYPE OF LABOR LEADER.

"If," Mr. Steffens says, "Mitchell, appealing, as I think he will, privately or publicly, to the men's sense of honor, can keep them from voting to repudiate the soft-coal union's contracts, then he will have triumphed the greater for his defeats and patience, and organized labor the world over will have scored a most conspicuous victory." Mr. Steffens insists on the fact that Mitchell's policy is so to conduct the business of organized labor that its leaders will have credit with any business man and their contracts of certain value. He represents in the fullest sense the class of labor leader of the new order, who talk little and work hard, and whom the workingmen have turned to because they are leaders who could command, and who knew how to compromise with their employers.

"Such a leader John Mitchell, the young president of the United Mine Workers, is trying to prove himself. He is a small, spare man, with

black eyes steady in a white, smooth face, which, with his habitual clerical garb and sober mien, gives him the appearance of a priest. The breaker boys find him kind; their elders approach him easily, but only on business, which they talk while he listens coldly, giving answers that are soft but short, cast in the form of advice or a direction, with the reason for it. He is never dictatorial, only patient and reasonable. He has no vanity, no fear for his dignity. It is said he is brave. Once during a strike in Pana, Ill., his men set out to attack some non-union men at work behind a stockade with guards who shot to kill. The strikers seized two of their employers, and putting them in front, made them lead the attack. Mitchell heard of it, and running to the scene, rescued the 'bosses.' His men turned on him in wrath; but he explained, and led off the captives from the furious crowd.

"But it is no one trait, however conspicuous, that will win success for Mitchell, if he wins (and that is a question which may be answered before this article is printed). At present he stands not quite midway between Wall Street and the mines. He has the personal respect of both. When President McKinley was shot, and the news spread to the coal region, the workmen gathered into a mob, crying, 'Who shot our President?' They dispersed when they learned that it wasn't President Mitchell who was shot. When Mitchell went to New York in 1900 to see J. P. Morgan, the financial head of the coal business, he was not received. This year an associate of Mr. Morgan happened to meet him socially; and when he reported what manner of labor leader Mitchell was, Mr. Morgan received him at his down-town office."

### HOW LABOR IS ORGANIZED.

**M**R. RAY STANNARD BAKER describes in the August *World's Work* the character of representative labor unions and how they perform their functions, and discusses the project of a general federation of labor.

He calls attention to the epoch-making event of the complete unification of the coal miners. This, he thinks, is, with the formation of the United States Steel Corporation, one of the greatest economic events of our time. The United Mine Workers have now the largest membership, and perhaps the greatest influence, of all trade unions ever formed. The member-

than 190,000, supporting a population of a million people, and influencing a large number. But it is only the greatest force of the tremendous movement, every tenth voter in America is a labor organization.

#### OF INTEREST IN LABOR UNIONS.

shows how the familiar idea of the interest, which Mr. Morgan and applied to the steel factories and being carried out on the side of the councils of the American Federation are officers of such organizations and Mine Workers, the Brotherhood, the Machinists, the Cigarmakers, Workers, the Iron and Steel Workers, the Painters, the Clerks, and several score of other national unions, representing a membership of 250,000 men. A few prominent outside the combination,—four of the railway workers, the Bricklayers, the Plasterers, for instance.

#### CENTRALIZATION OF POWER.

There is a centralization of power in the hands of the men who are running our railroads, making our steel, so trade-unionism is a centralization of power in national unions, each of a single industry, the board of which, and especially the head of himself, is yearly getting greater. A few years ago the members of almost every union,—say, in New York City,—could make their tools and strike; but now power is usually obtained from the officers of a central organization, who are perhaps the most influential in the city.

#### CENTRALIZATION OF THE UNIT, THE LOCAL UNION.

A local union has the regular officers, an important business agent (once called a steward, a name now generally discarded), usually the secretary-treasurer as agent in large unions, sometimes with a salary equal to the pay which he would have worked at his trade, together with expense allowances. Members are fined under penalty of fines to attend the union once a month, or once in a year, although in some cases, where the work is very large, no such requirement exists. The 'Big Six,' New York Typographical Union, including all the printers of the city, occupies a very large building to contain its members. But this is the largest local

union in America. The cigar makers have no fewer than ten local unions in New York City with a membership of nearly 6,000, an average of 600 members to the union."

#### INITIATION FEES.

"The greatest diversity of opinion exists as to initiation fees. In some unions a large fee is collected,—sometimes as high as \$50, or \$75, or more,—on the ground that a man who pays a large sum to get in will be more likely to remain loyal; but other successful unions charge as little as \$2,—the cigar makers' fee being only \$3. The dues subsequently collected are usually about one dollar a month, this low payment often including liberal benefits in case of sickness, strike, or death. Many of the unions now use the stamp system in collecting their dues. A little book is presented each week or each month to the treasurer, who pastes in and cancels the official stamps of the union for the amount of the dues paid. It is a sight worth seeing on a Saturday or a Monday to watch the workmen, or their wives, or their children, each with a book, lined up in a long row at the office of the treasurer of certain unions, waiting to pay their dues."

#### THE AMERICAN FEDERATION OF LABOR.

Nearly every large city has a central labor union, a body made up of delegates from all or nearly all the local unions of every trade.

"But the greatest of all American organizations is the National Federation,—the American Federation of Labor,—of which Samuel Gompers is president, with headquarters in Washington. A great combination of national and international unions, with yearly conventions of delegates, a staff of well-paid officers and organizers, an extensively circulated magazine, this federation includes nearly all the great national and international unions. The American Federation of Labor was founded in 1881, and is now made up of eighty-two national and international unions composed of 9,494 local unions, 16 State federations, 206 city central labor unions, and 1,051 local unions not attached to national bodies. The total membership is over 1,250,000,—a body of men united for the single purpose of advancing the cause of labor, and yet taking no political action. This number represents something more than three-quarters of all the trade-unionists in America. The federation is supported by a small tax on affiliated organizations, its receipts last year being about \$71,000, its expenses \$68,000, mostly for salaries and organizing expenses, and for the annual convention. Its chief work consists in securing legislation in the United States Congress, in harmonizing and directing union

effort in the struggles common to all union labor ; in using its influence in securing the use of union label goods and in behalf of certain kinds of strikes, and in urging union labor everywhere to refuse to purchase goods manufactured or sold by 'unfair' concerns. Every month a long list of these 'unfair' houses appears in the *American Federationist* under the heading, 'We Don't Patronize.' Not infrequently it is able to prevent ill-advised strikes. The federation has been instrumental in securing the passage of many laws which have greatly improved the condition of American workmen. A bare list of them is evidence enough of the remarkable rise in standards during the last twenty-five years of wages, comfort, and independence among the workers of the country."

Mr. Baker thinks that the old method of the strike is more and more looked upon as a thing to be avoided if possible,—as a last resort, an appeal to brute force when diplomacy fails. He thinks this feeling among workmen is due to the fact that employers have generally come to recognize the union as a sober business reality.

#### THE DEMANDS OF AMERICAN LABOR.

The demands of the American Federation of Labor, made in resolutions at its annual convention, will give an idea of what American workmen are thinking about, and what they seek. Here is the list of the demands :

1. Compulsory education.
2. The repeal of all conspiracy and penal laws affecting seamen and other workmen, incorporated in the federal and State laws of the United States.
3. A legal workday of not more than eight hours.
4. Sanitary inspection of workshops, mines, and homes.
5. Liability of employers for injury to health, body, and life.
6. The abolition of the contract system in all public works.
7. The abolition of the sweating system.
8. The municipal ownership of street cars, waterworks, and gas and electric plants for the distribution of heat, light, and power.
9. The nationalization of telegraphs, telephones, railways, and mines.
10. The abolition of the monopoly system of land-holding and the substitution therefor of the title of occupancy only.
11. Direct legislation and the principle of referendum in all legislation.
12. The abolition of the monopoly privilege of issuing money and substituting therefor a system of direct issuance to and by the people.

#### ARBITRATION AS A PREVENTIVE OF STRIKES.

IN view of the increasing importance of the part played by the labor unions in all recent differences between employer and employee in this country, there has been much discussion of the proposition for compulsory arbitration as a means of preventing, or at least greatly reducing, the number of costly and prolonged strikes. The problem is restated in an article by Mr. John Handiboe, contributed to the July number of the *North American Review*. Mr. Handiboe lays much stress on the point that labor unions have come to stay and must be taken into all the calculations of industrial enterprise. He decries the mistaken policy of many employers in refusing to treat with employees as a body of united workmen, and in declaring their determination to consider these men only as individuals. Referring to the history of labor disturbances in the anthracite region of Pennsylvania, this writer names as one source of irritation and disturbance the continued refusals of the operators to meet the miners in joint conference as to wage scales or grievances, and to submit to arbitration matters in dispute.

If, however, labor unions are to be recognized and treated with as legitimate organizations, Mr. Handiboe lays down the proposition that all unions, whether local, state, or national, should be incorporated. This should be done in order that the two parties to labor disputes should be on an equal footing, the common ground being equal responsibility for violation of contracts. "At present," says Mr. Handiboe, "labor unions can abrogate a contract, real or implied, at a moment's warning, without the least fear of consequential punishment of any kind; and there is nothing to prevent employers doing likewise. There must be created a responsibility for the performance of wage or work contracts as a basis for the elimination of all deterrents that now prevent cure of the strike evil. For this purpose, there should be a binding contract entered into by employer and employee, and he who violates it should be held accountable under the law. Such contract cannot be made, however, unless employers recognize the labor union, which many of them now refuse to do,—and unless labor unions become incorporated, a step to which they have no inclination."

#### COMPULSORY ARBITRATION AND PERSONAL RIGHTS.

Mr. Handiboe's argument for compulsory arbitration is based not on the predilections of either capital or labor, but on the interests of the great public, which is indeed the chief sufferer when a strike occurs. In his view the capitalist "who has nothing to arbitrate" is equally at fault with

the labor leader, who opposes compulsory arbitration from a fear that it might deprive him of some of his present power in the union, and the highest good of the community demands that both parties be brought to some kind of settlement. To the objection that a law designed for the adjustment of labor disputes would be unconstitutional because it would invade the rights and privileges of the individual and take out of his hands the prerogative of controlling his own business, Mr. Handiboe replies that theoretically the objection is true, but practically it is not true. "For the good of the community, laws are enacted and enforced which deprive men of thorough freedom of action and regulate even the degree of personal liberty which they may enjoy. In his own home he must comport himself in such manner that he shall not annoy his neighbors. He must send his children to school whether he wants to or not. He must build his house, his factory, or his theater as the law specifies. He cannot dress as he may elect, although he boasts that the contrary is the case. The employer should not be permitted to endanger the peace of any community by an appeal to the opinions of Mr. Bounderby; and the employee should be prevented from putting into practice the teachings of the ranting demagogue. A compulsory arbitration law need not regulate the wages paid by any man to any other man. But it would provide for the hearing and determination of a wage dispute, when the parties to that dispute are not inclined to end the matter for themselves."

#### HOW THE PUBLIC INTEREST WOULD BE FURTHERED.

After referring to the compulsory arbitration law which has now been in successful operation in New Zealand for several years, Mr. Handiboe concludes his article as follows:

"Unions having been incorporated, a system of contracts provided, and a compulsory arbitration law enacted, the plans for preventing strikes could be said to be well advanced. Such a law need not be invoked in all cases, but only when all other efforts toward the settlement of a dispute shall have been exhausted. The employer and his employee should endeavor to adjust matters at issue between them without the interference of anybody else,—walking delegate, union official, or other functionary. And it is obvious that, with a compulsory arbitration law enacted, such adjustments would be reached with growing frequency. In no case should a 'sympathy' strike, or a strike in a whole labor district where only a local grievance is to be determined, be permitted under a law of compulsory arbitration. Unless the dispute of itself spread beyond a local area, the district officers of a

union should not be called upon to conduct negotiations or direct the actions of the working men. The smaller the area of disaffection shall be, the greater will be the probability of a peaceful settlement. But if, as is now too frequently the case, neither side is inclined to give ear to the other, the preëminence of the public should be demonstrated. Then compulsory arbitration should be invoked and enforced, and recalcitrants should be punished for violation of the orders of the board. With the unions, as well as the employers, incorporated, this could be done. With compulsory arbitration operative, we should have closer relations between capital and labor; fewer disturbances of business; the elimination of private armies; less marching and intimidation; less rioting and bloodshed; less financial loss to the community; fewer strikes; and the placing of real public welfare above supposititious private right."

#### A NEW FORM OF PROFIT-SHARING.

THOSE economists who are working out plans for the partnership of capital and labor in industrial enterprises are seeking a broader basis than the mere distribution in cash of a percentage of the profits among wage-earners. A carefully thought-out project of industrial partnership is presented in the current number of *Annals of the American Academy of Political and Social Science*, by Mr. Alexander Purves, treasurer of Hampton Institute. Mr. Purves has taken account of the various objections that have been raised to ordinary profit-sharing,—as, for example, the well-grounded fear that wage-earners would often make an unwise use of profits thus distributed,—and the result of his studies on the subject is a carefully-matured plan by which he believes that the interests of both capitalists and wage-earners will be conserved, while the services of the employees will increase in value in direct ratio with the rewards of their industry.

#### REGULAR DIVIDENDS AND WAGES PAID FIRST.

Briefly, Mr. Purves' proposition may be stated as follows: A binding agreement will provide for the payment of the regular standard of cash wages to all employees of the concern, including the officials and the management, and will also name a definite amount which shall be determined to be a just and fair annual return to capital for its simple use; this amount, however, will not exceed, say, 60 per cent. of the average established net earnings. The agreed amount to be paid annually (in quarterly or half-yearly installments) as a cumulative dividend on the common stock of the corporation; it is to be especially understood that

the company by a two-thirds vote of its common stockholders may issue, if needed for additional capital, preferred stock; wages to be a first claim upon the assets, and the dividends to capital stock to have the first claim upon the net earnings, and to be cumulative at a rate fixed by agreement. After the payment of such dividends as are first charged upon a net part of the business, 20 per cent. of the net profits then remaining shall be set aside in a contingent fund, and the balance of the annual net profits then remaining shall be held in the business,—one-half for the benefit of the stockholders, and one-half for the employees (under certain agreements and restrictions to be explained). Thus the surplus earnings in excess of the regular cash dividends would continue to be accumulated in the business, and so increase the security of the original investment, while the power of the stockholders to control the management of the concern would be in no way diminished or endangered.

#### DISPOSITION OF SURPLUS EARNINGS.

This will be effected, Mr. Purves explains, by the following method: It is proposed that, after the regular cash dividends have been paid to capital, and a percentage set aside for the contingent fund, the annual stock dividends shall be declared, covering the amount of the surplus earnings, which are to be held in the business; that the certificates issued for these stock dividends shall be in the nature of deferred stock debentures, which will have no voting power, and which shall be subordinate in every respect to the common stock, both as to dividends and principal, so that these deferred stock debentures shall not be entitled to any dividend interest whatsoever, except when earned during the then current year, and not until after the dividends upon any preferred stock shall have been paid or set aside, nor until the agreed sum (equal to 60 per cent. of the established average net earnings) shall have been paid or set aside for the dividends upon the common stock, and a contribution made to the contingent fund. These deferred stock debentures are to receive dividends at a rate not exceeding 6 per cent. per annum when earned in the then current year, and in no sense are these dividends to be cumulative. In the event of liquidation or dissolution, the common and preferred stock shall be paid in full before any payment shall be made upon the deferred stock debentures; but the debentures shall then receive all of the assets remaining after the payment in full of the preferred and common stock and of all outstanding indebtedness, and the debentures shall always be subordinate to the general creditors of the company.

#### STOCK DEBENTURES HELD IN TRUST FOR EMPLOYEES.

These deferred stock debentures are all to be issued to a trustee,—one-half to be held in trust for the benefit of the common stockholders; and one-half to be considered as extra wages, and to be held by the trustee for the benefit of the employees. Cash dividends, on all deferred stock debentures when declared are to be paid to the trustee, who will disburse them,—one-half to the holders of the common stock *pro rata*, and one-half to the employees in proportion to the prospective (or respective?) amounts standing to their credit on their debenture books. Mr. Purves explains the workings of his scheme by the following illustration: Supposing the capital of the concern to be \$1,000,000, and the net earnings for several years to have averaged \$200,000 a year. Sixty per cent. of these earnings, or \$120,000, would be the amount agreed on as the annual cash dividend to capital represented by the common stock; 20 per cent. of the balance of these earnings, or, say, \$16,000, would be the amount to be paid into the contingent fund, and at the end of the first year of the operation of the plant the balance, or sum of \$64,000, would be held in the business; but deferred stock debentures to cover this amount would be issued to the trustee,—\$32,000 to be held for the use of the stockholders, and \$32,000 as extra wages to be held for the employees.

At the end of the second year, after the payment of the dividends to the common stock and a percentage to the contingent fund, a dividend would be declared upon the \$64,000 of deferred stock debentures, and for the balance of the net profits still remaining another issue of deferred stock debentures would be made to the trustee, and so on from year to year. Thus the effect of the arrangement would be that the surplus earnings of the corporation would be capitalized in the form of deferred stock debentures, and held in trust for the joint interest of the original owners or their assigns and their employees. The amount of deferred stock debentures to which each employee is entitled would be ascertained each year by determining the proportion that his wages for the year bears to the whole salary list for that period. This amount is then set down in the debenture book of the employee, and on this sum he is entitled to receive through the trustee, when earned, dividends not exceeding 6 per cent. per annum uncumulatively and subject to certain limitations. These limitations, as set forth by Mr. Purves, secure the management fully against any usurpation of its control of the business, confirm its authority to employ

or discharge employees, and provide for its supervision of all other matters pertaining to the business.

Our space limitations do not permit of a more extended summarizing of Mr. Purves' plan, but for further details our readers are referred to the complete paper as it appears in the *Annals* for July.

### THE PANAMA CANAL ROUTE.

THE passage by Congress of the so-called "Spooner substitute" for the Isthmian Canal bill, by the terms of which a canal is to be constructed under certain conditions by the Panama route rather than the Nicaraguan, lends an additional interest to Prof. William H. Burr's elaborate study of the Panama route, the first portion of which appears in the *Popular Science Monthly* for July. Professor Burr, it will be remembered, was one of the engineer members of the Isthmian Canal Commission, and is thoroughly familiar with all the materials relating to the Panama route that have been in the possession of the commission, as well as with all the special surveys and investigations made under the commission's authority during the past three

years. While it is generally understood that the line adopted by the canal commission for the purposes of its plans and estimates was the route selected by the Panama Canal Company, several features of that route, as described by Professor Burr, are not matters of general knowledge. The route as outlined by Professor Burr is as follows: "Starting from the six-fathom contour in the harbor of Colon, the line follows the low marshy ground adjoining the Bay of Limon to its intersection with the Mindi River; thence through the low ground continuing to Gatun, about six miles from Colon, where it first meets the Chagres River. From this point to Obispo the canal line follows practically the general course of the Chagres River, although at one point in the marshes below Bohio it is nearly two miles from the farthest bend in the river at a small place called Ahorca Lagarto. Bohio is about seventeen miles from the Atlantic terminus, and Obispo about thirty miles. At the latter point the course of the Chagres River, passing up stream, lies to the northeast, while the general direction of the canal line is southeast toward Panama, the latter leaving the former at this location. The canal route follows up the general course of a small stream, called the Camacho, for

From the *Engineering Magazine*.

PROFILE OF THE PANAMA ROUTE.

a distance of nearly five miles, where the continental divide is found, and in which the great Culebra cut is located, about thirty-six miles from Colon and thirteen miles from the Panama terminus. After passing through the Culebra cut, the canal route follows the course of the Rio Grande River to its mouth at Panama Bay. The mouth of the Rio Grande, where the canal line is located, is about a mile and a half westerly of the city of Panama. The Rio Grande is a small, sluggish stream throughout the last six miles of its course, and for that distance the canal excavation would be made mostly in soft silt or mud."

#### HARBOR IMPROVEMENTS.

The commission considered the feasibility of a sea-level route with a tidal lock at the Panama end, and it was found that the approximate cost of completing the work on that plan would be about \$250,000,000, while the time required would probably be nearly or twice that needed for the construction of a canal with locks. The commission therefore adopted a project for a canal with locks. The commission projected a canal channel into the harbor of Colon which, with the construction of the harbor itself, was estimated to cost over \$8,000,000, while the annual cost of maintenance was placed at \$30,000. Regarding the harbor at the Pacific end of the channel. Professor Burr says:

"The harbor of Panama, as it now exists, is a large area of water at the extreme northern limit of the bay, immediately adjacent to the city of Panama, protected from the south by the three islands of Perico, Naos, and Culebra. It has been called a roadstead. There is good anchorage for heavy-draft ships, but for the most part the water is shallow. With the commission's requirement of a minimum depth of water of thirty-five feet, a channel about four miles long from the mouth of the Rio Grande to the six-fathom line in Panama Bay must be excavated. This channel would have a bottom width of two hundred feet with side slopes of one on three where the material is soft. Considerable rock would have to be excavated in this channel. At 4.41 miles from the six-fathom line is located a wharf at the point called La Boca. A branch of the Panama Railroad Company runs to this wharf, and at the present time deep-draft ships lie up alongside of it, and take on and discharge cargo, as do the trains of the Panama Railroad Company. This wharf is a steel-framed structure, founded upon steel cylinders, carried down to bedrock by the pneumatic process. Its cost was about \$1,284,000. The total cost of this excavated channel, leading from Panama Harbor to the pier at La Boca, is esti-

mated by the commission at \$1,464,513. As the harbor at Panama is considered an open roadstead, it requires no estimate for annual cost of maintenance."

#### THE DAM AT BOHIO.

The principal engineering feature of the route is found at Bohio, where there will be a great dam constructed across the Chagres River, forming Lake Bohio, the summit of the canal. This lake will have a superficial area during high water of about forty square miles. The water will be backed up to a point called Alhajuela, about twenty-five miles up the river from Bohio. For a distance of nearly fourteen miles, from Bohio to Obispo, the route of the canal would lie in this lake. Although the water would be from eighty to ninety feet deep at the dam, Professor Burr says that for several miles below Obispo it will be necessary to make some excavation along the general course of the Chagres in order to secure the minimum depth of thirty-five feet for the navigable canal. The Bohio dam will raise the water surface of the canal from sea level in the Atlantic maritime section to an ordinary maximum of ninety feet above sea level. This total lift is divided into parts of forty-five feet each. There will therefore be a flight of two locks at Bohio.

#### FORMOSA UNDER JAPANESE RULE.

NOT all Americans are aware that Japan, for the past seven years, has had to deal with conditions in her dependency of Formosa not unlike those which are now confronting the United States in the Philippines. Formosa was conceded to Japan as a result of the war with China in 1894-95. After the cession the island passed through a period of military government corresponding with our own administration in the Philippines; and after the military rule was ended a civil governor was appointed, who was made entirely responsible for the civil administration of the island. Thus far there have been in succession four governor-generals and three civil governors. At present, Baron Kodama is governor-general and Dr. Shimpei Goto civil governor of Formosa. Dr. Goto has visited the United States during the present summer, for the purpose of studying our institutions. During his visit he contributed an account of the Japanese administration of Formosa to the *Independent* of July 3. To this article we are indebted for the following facts:

As in the Philippines, the population of Formosa is made up of various racial elements. According to the statistics for 1899, the total number of natives in the island was 2,725,041;

DR. SHIMPEI GOTO.

less than 100,000 of these are aborigines. Chinese emigrants from the south of China or their descendants constitute a large proportion of the population. Thus far only about 33,000 Japanese have taken up their residence in the island, although this number does not include the troops stationed in the island. According to Dr. Goto, the Chinese in Formosa are only half-civilized, and while their customs and religious proclivities are similar to those of their countrymen in the southern provinces of China, few of the Chinese in Formosa are acquainted with Chinese characters. One reason for the tardiness of the Japanese to migrate to the island is to be found in the unhealthy climate. But the sanitary measures adopted by the Japanese authorities have already worked wonders, and many of the disagreeable features of life in Formosa have been greatly modified or wholly eliminated. For instance, the number of mosquitoes, flies, and other noxious insects has been greatly decreased. The streets of some of the cities have been cleansed by drainage systems, and a good water supply has been secured by means of artesian wells. The percentage of sickness and deaths among the Japanese officials resident in Formosa has shown a great improvement since the first years of Japanese occupation. The decrease in the death rate has been more than 75 per cent.

## EDUCATION.

The authorities have found it necessary to take vigorous measures to secure the prevailing use of

the Japanese language throughout the island, but at the same time they have felt the need of having Japanese officials conversant with the native tongue. A central language school was therefore established, for the double purpose of teaching the Japanese language to the natives and the native language to the Japanese. This institution is divided into a normal-school department and a language-school department, the former training Japanese students to serve as teachers in primary schools for native children, local language, and normal schools and primary schools for Japanese children. In the language-school department the Japanese language is studied by the native students and the native language by the Japanese students, the students in both sections being trained with the object of fitting them for public service or for private occupations in Formosa. The educational work conducted under the government auspices is by no means confined to language study, but up to this time this appears to have been the branch of instruction to which chief attention has been devoted.

## FINANCIAL POLICY.

More than three years ago Governor-General Kodama projected a remarkable programme for the execution of public undertakings, extending

BARON GENTARO KODAMA.  
Governor-General of Formosa.

over a period of twenty years, together with a project for establishing government monopolies of industries. These undertakings, as described by Dr. Goto, include (1) the laying of a trunk-line railway extending over the whole length of the island; (2) the surveying of lands; (3) the construction of harbors, and (4) the building of government offices and residences. To meet the expenditures required for these works, the Formosan government was authorized to raise loans to the amount of 35,000,000 yen, of which the principal and interest was to be paid out of the revenues of the island. It is estimated that the railroad work alone will require 28,810,000 yen, the construction of the harbor of Kelung 2,000,000, the land-surveying 3,000,000, and the building of government offices and residences 1,200,000. It is believed that the railroad will be finished much within the ten years' time originally assigned to the work, and that it will have a remarkable effect in stimulating industries on the island. Revenues accruing from the part of the island now open to traffic are greater than they were expected to be. The completion of an accurate land survey will confirm rights over land, will make landed property secure, and will greatly facilitate transfers. This work, by the way, was undertaken by the Chinese governor some years ago, but without success. As to the projected harbor works at Kelung, this is only the beginning of improvements for that port which will involve the expenditure of tens of millions of yen. It is the intention of the government to make this the chief port of Formosa, and it is believed that the growing industry and commerce of the island justify all the expenditures that have been projected. In the erection of public buildings great care has been taken in regard to sanitary arrangements, and the structures already built or in process of completion will serve as models for the whole island.

#### GOVERNMENT MONOPOLIES.

With a view to the gradual abolition of the pernicious habit of opium smoking, the Japanese government has established a monopoly of the article in Formosa which yields an annual revenue at present of about 4,000,000 yen. Under the restrictions established by the government, only those who have been already poisoned by opium to such an extent that they are unable to abandon the habit of smoking without great pain are allowed, by special warrant of the government, to use it as a medicine. The formation of the habit is absolutely forbidden, or, in fact, its continuation in cases where poisoning has not advanced so far as to make abstinence impossible. There is also a salt monopoly yielding

700,000 or 800,000 yen, and this commodity is now exported to Japan in considerable quantities. It is produced by permitting salt water to flow into fields, and then causing it to evaporate by the heat of the sun. Almost the whole supply of camphor of the world comes from Formosa. When Japan acquired Formosa a camphor monopoly was established, with a view to protecting the camphor trees, improving the methods of manufacturing, and putting the industry on a secure basis. The production is now regulated according to the demands of the world's market. The revenue yielded by the monopoly is now about 4,000,000 yen. The present governor-general has also formed a plan for eventually making the Formosa finances entirely independent of imperial aid. The imperial government began the administration of Formosa with a grant of nearly 6,900,000 yen, and this grant has been annually diminished until the present time. According to Baron Kodama's project, which was adopted by the Diet, the grant will be steadily decreased until it will entirely disappear in 1910.

The possibility of this gain of financial independence may be seen when we consider the recent remarkable increase of the revenue,—from 5,000,000 yen in 1897 to 14,000,000 yen at present, with the probability of an increase to 20,000,000 yen in two or three years, this increase being largely secured as a result of the operation of the monopolies, the adjustment of the land tax, and other financial reforms. As the total expenditure incurred by Japan in connection with Formosa up to the end of the last fiscal year, March 31, 1901, amounted to 150,000,000 yen, including the military expenses, while in the same period the revenue amounted to only 40,000,000 yen, the financial burden to be charged to Formosa may be reckoned as 110,000,000 yen in all. As the annual revenue derived from Formosa is now from 14,000,000 to 20,000,000 yen, it may be said, as Dr. Goto points out, that the capital invested by the imperial government is bearing interest at the rate of 15 to 20 per cent. The import of Japanese commodities into Formosa is now about 15,000,000 yen. Supposing the profit of this trade to be at the rate of 20 per cent., the annual gain of Japan is about 3,000,000 yen, which nearly covers the present amount of the grant which the Formosan government receives from the imperial government.

#### RESOURCES OF THE ISLAND.

Among the more important products of Formosa named by Dr. Goto are tea, rice, sugar, hemp and flax, indigo, paper, silk, minerals, cattle, and marine produce. Dr. Goto predicts that

the production of sugar will be greatly increased within a few years. As to the mineral wealth of the island, gold, sulphur, coal, and petroleum are found there in considerable quantities, the yearly output of gold being about 1,000,000 yen at the present time. All in all, Dr. Goto draws a very favorable picture of Formosan resources, and seems to fully justify his assertion that this dependency, far from being a financial burden to the home government, is really a valuable investment.

#### THE TRANSVAAL MINES.

SINCE the close of hostilities in South Africa, attention is again concentrated on the mining possibilities of the Rand. The *Engineering Magazine* for July opens with an article by the famous mining expert, Mr. John Hays Hammond. After giving a general summary of the beginnings and development of the mines, he reviews the probable benefit of the change of government for mine owners. The amount of ore mined in 1887 was 23,000 ounces; in 1898, 4,295,609 ounces, valued at £15,141,376.

#### THE WATER SUPPLY.

One of the chief difficulties to be contended with is the poor supply of water, which at present is obtained by local storage of rain water,—not a very satisfactory arrangement. Within twenty or twenty-five miles of Johannesburg there are, however, other sources of water supply which will probably be utilized. Of the maps prepared Mr. Hammond says:

“Great attention is given to the preparation of maps of the underground workings, geological sections, and plans upon which assays are plotted. In these respects the Rand practice is far ahead of that of any other country with which I am familiar.”

#### AMERICANS FOR RESPONSIBLE POSITIONS.

The labor question is always a difficult one. Mr. Hammond says:

“Reference has already been made to the labor question, in statistics of the relative number of whites and blacks employed. The white workmen are predominantly British, though many of the important members of technical staffs are Americans; the mine and mill foremen are usually either Americans, or British subjects who have had mining experience in America. This labor is generally below the American standard, but is rapidly improving. Manual workers on the surface and all miners except those running machine drills, are blacks, and the quality of the black labor is very poor, especially on first arriving at the mines.”

#### TRANSPORT DIFFICULTIES.

Mr. Hammond looks for a reduction in the present excessive railway rates. He says:

“Generally speaking, the cost of the principal machinery, erected on the ground, will be two and one-half times its home cost. In respect of labor, cost of dynamite, and charges for railway transport, marked improvement is confidently to be expected from the change of governmental conditions.”

#### LAWS AND MONOPOLIES.

Mr. Hammond speaks well of the Transvaal laws:

“The mining laws of the Transvaal are most excellent in character, and while the claims cover every square foot of land for an area of nearly 40 miles long by from 2 to 3 miles wide, there have been practically no conflicts over extra-lateral rights.

“Notwithstanding the change in the political status of the Transvaal which will follow the recently concluded peace and final establishment of British rule, it may be confidently assumed that the main features of the mining law of the South African Republic will be retained, and certain oppressive features of monopolies, etc., bearing with special weight on the mining industry, will be abolished. The dynamite monopoly was one that bore most heavily on the mining industry: and, according to the reports of the state mining engineer, explosives, including fuse and detonators, amounted to nearly 10 per cent. of the total working costs of the mines.

#### A FEW FORECASTS.

“It is estimated that for every mile in length along the course of the reefs, down to a vertical depth of 1,000 feet for the dip of the reefs, gold to the value of about £10,000,000 will be extracted. This is a conservative estimate,—at least as applied to the central section of the Rand. If we assume these conditions to obtain to a depth of 6,000 feet vertically, we have the enormous sum of £60,000,000 for each mile in length. It is not unreasonable to suppose that these conditions will be maintained along most of the central section,—say, for a distance of ten miles,—in which case we would have an auriferous area, within practicable mining depths, containing upward of £600,000,000 value of gold.”

“If,” says Mr. Hammond, “I were called upon to express my opinion, I would estimate the future duration of profitable operations on a large scale in the district at less, rather than more, than twenty-five years. I believe that, as the result of economic reforms, there will be an ultimate saving of 6s. per ton of ore treated.”

## PROFESSOR HEILPRIN ON MONT PELÉE.

THERE recently returned from Martinique a party of scientists, artists, and newspaper men, who had hastened to the site of St. Pierre almost as soon as the news of the catastrophe was made known. One of these was Prof. Angelo Heilprin, who has for twenty years been identified with the scientific institutions of Philadelphia. Professor Heilprin writes in the August *McClure's* of his observation on Mont Pelée, and of the deductions he has drawn from these observations as to the original cause of the great volcanic upheaval.

Professor Heilprin was the first man to ascend the volcano after the great catastrophe. On May 31, he went up the crater to an altitude of about 4,000 feet. He found that the old crater had not been blown out, as was reported. The next day Professor Heilprin made another ascent to the same crater, accompanied by Messrs. Kennan, Jaccaci, and the artist George Varian, who contributes the pictures which illustrate this article. The party arrived at an elevation of 4,025 feet. They found the temperature to be, two or three inches below the surface,  $124^{\circ}$  to  $130^{\circ}$ , and at a somewhat greater depth  $162^{\circ}$ . Puffs of steam were issuing from a number of vents, and from beneath great boulder masses, whose heated surfaces were scarred with sulphur blotches.

## THE VIEW INTO THE CRATER.

"We waited patiently for a lifting of the clouds, and it came at last. A sudden gust cleared the summit, and sunlight illuminated the near horizon. We dashed to the line above which welled out the huge steam cloud of the volcano, and in a few instants stood upon the rim of the giant rift in whose interior the world was being re-made in miniature.

"We were four feet, perhaps less, from a point whence a plummet could be dropped into the seething furnace. Momentary flashes of light permitted us to peer deep into the tempest-tossed caldron, but at no time could we see its floor, for over it roiled the vapors that rose out to mountain heights. Opposite us, at a distance of perhaps 200 feet or more, across the thin steam vapor, trembled the walls of the other face of the crater. Halfway between rose the central core of the burned-out cinder masses, topped by enormous white rocks, whose brilliant incandescence flashed out the beacon-lights which were observed from the sea some days after the fatal 8th, and even at our later day illumined the night-crown of the volcano with a glow of fire. From the interior came deep rumbling detonations, the clinking of falling and sliding cinders, the hissing of the emerging steam, and other

sounds which were described. We saw gas or steam

### PROFESSOR HEILPRIN ON MONT PELÉE.

THERE recently returned from Martinique a party of scientists, artists, and newspaper men, who had hastened to the site of St. Pierre almost as soon as the news of the catastrophe was made known. One of these was Prof. Angelo Heilprin, who has for twenty years been identified with the scientific institutions of Philadelphia. Professor Heilprin writes in the August *McClure's* of his observation on Mont Pelée, and of the deductions he has drawn from these observations as to the original cause of the great volcanic upheaval.

Professor Heilprin was the first man to ascend the volcano after the great catastrophe. On May 31, he went up the crater to an altitude of about 4,000 feet. He found that the old crater had not been blown out, as was reported. The next day Professor Heilprin made another ascent to the same crater, accompanied by Messrs. Kennan, Jaccaci, and the artist George Varian, who contributes the pictures which illustrate this article. The party arrived at an elevation of 4,025 feet. They found the temperature to be, two or three inches below the surface,  $124^{\circ}$  to  $130^{\circ}$ , and at a somewhat greater depth  $162^{\circ}$ . Puffs of steam were issuing from a number of vents, and from beneath great boulder masses, whose heated surfaces were scarred with sulphur blotches.

#### THE VIEW INTO THE CRATER.

"We waited patiently for a lifting of the clouds, and it came at last. A sudden gust cleared the summit, and sunlight illuminated the near horizon. We dashed to the line above which welled out the huge steam cloud of the volcano, and in a few instants stood upon the rim of the giant rift in whose interior the world was being re-made in miniature.

"We were four feet, perhaps less, from a point whence a plummet could be dropped into the seething furnace. Momentary flashes of light permitted us to peer deep into the tempest-tossed caldron, but at no time could we see its floor, for over it roiled the vapors that rose out to mountain heights. Opposite us, at a distance of perhaps 200 feet or more, across the thin steam vapor, trembled the walls of the other face of the crater. Halfway between rose the central core of the burned-out cinder masses, topped by enormous white rocks, whose brilliant incandescence flashed out the beacon-lights which were observed from the sea some days after the fatal 8th, and even at our later day illumined the night-crown of the volcano with a glow of fire. From the interior came deep rumbling detonations, the clinking of falling and sliding cinders, the hissing of the emerging steam, and other

sounds which were too feebly defined to be described. We felt no inconvenience from either gas or steam.

"We found that we were standing on an overhang, and therefore dared not tarry beyond the time needed to make observations. I attempted to locate the axis of the vent as nearly as the direction of its largely obscured walls and the position of the basin of Lac des Palmistes permitted. I found it to be N.-S., slightly S.W. The magnetic needle, which the day before showed a marked deflection, was nearly normal. The form of the crater is that of a caldron, pitching steeply downward toward the Caribbean, and opening in a direction a little west of the line to St. Pierre. At no time could we positively ascertain the extreme boundaries. Its length must have been 500 feet; it may have been much more. There can be no question that at the downward side of the crater the rift traverses the position of the narrow rift known as the *Fente*, or the *Terre Fendue*, which had been a feature of the mountain since the eruption of 1851, and perhaps existed long before that event.

"Any statement regarding the depth of the crater must for the time remain conjectural. I should say that it could hardly be less than from 200 to 250 feet; it might be very much more."

#### WHAT CAUSED THE ERUPTION OF MAY 8?

Professor Heilprin says that the death-dealing eruption of May 8 was from the lower crater. He proves that the description of the catastrophe which spoke of moving sheets of flame were erroneous. Instead, there was a luminous, or incandescent, cloud which may easily in that terrible time have given the impression of flame.

This glowing cloud, Professor Heilprin says, was composed of one of the heavier carbonic gases brought under pressure to a condition of extreme incandescence "and whose liberation in contact with the oxygen in the atmosphere, assisted by electric discharges, wrought this explosion, or series of explosions, that developed the catastrophe."

The great cloud of incandescent vapor undoubtedly produced a tornado, and Professor Heilprin found evidence of storm paths lying across the city's ruins. He also considers it certain that electric explosions had their share in the phenomena.

#### THE ORIGIN OF THE CARBONIC GAS.

"To the inquiry as to what was the source of this carbon gas,—to my mind the main factor of the catastrophe,—the geologist points to those vast bituminous deposits, like those of Venezuela and the island of Trinidad, which lie but little out

of the line of the connected series of volcanoes, of which the Soufrière of St. Vincent and Pelée of Martinique are a part. He also points to the limestone deposits, with their enormous masses of locked-up carbon, forming the foundation upon which these same volcanoes are implanted, which indicate a source of energy far greater than was required for the catastrophe of Pelée. Though no one could have foretold the cataclysm long in advance of its coming, the episode, except in its magnitude and terrible consequences, is no surprise to the geologist, who knows this region to be in an area of extreme weakness in the earth's crust. This region of terrestrial instability includes the greater part of the Caribbean and Gulf basins, and defines in its eastern contour the line of disappearance and breakage of the South American Andes, whose sunken crest is the pediment of the lesser Antilles. What great disturbances, if any, have taken place in the sea bottom as the result of the recent occurrences is a question that will take time to determine; but there is evidence already that some change has taken place west of Martinique, between the depth of 1,500 and 2,000 fathoms. The eruptions of Colima in Mexico, the earthquakes that so recently destroyed the towns of Chilpancingo in Mexico and Quetzaltenango in Guatemala, the minor disturbances in Nicaragua, are but phases of the phenomena which culminated so disastrously in the explosions of the Soufrière of St. Vincent and Mont Pelée of Martinique."

#### WHAT CAUSED THE DEATHS AT ST. PIERRE?

**F**ORTUNATELY for the cause of science, several unusually competent investigators were able to visit Martinique and St. Vincent before the volcanic eruptions of May had ceased, and their observations have already been reported in detail. The full report of the representatives of the National Geographic Society appears in the July number of the *National Geographic Magazine*. This report, which was prepared by Dr. Robert T. Hill, of the United States Geological Survey, is interesting not only as a presentation of facts regarding the great catastrophe, but also for the theories that it suggests to account for the enormous fatality at St. Pierre.

Dr. Hill states two such theories, one or the other of which may ultimately be adopted:

1. The heat-blast theory. This hypothesis assumed that the lapilli, gases, and steam of the ejected cloud were sufficiently hot to have inflamed the city and destroyed the people by singeing, suffocation, and asphyxiation. It does not account for the forces exerted radially and horizontally, nor the flame.

2. The aerial-explosion theory. The explosion of gases within the erupted cloud after their projection into the air would account for all the phenomena observed.

"The aerial explosion, if it occurred, was most probably a combustible gas, but science is still unable to state its nature. The discussion of explosive gases involves a line of scientific specialization which the writer does not possess; but as sudden and mysterious as was the great secret, it has left its traces and clues which the detectives of science will follow up. Metal surfaces of objects in the ruins will be examined and analyzed for traces of sulphur and chlorides. The deposits from the numerous steaming fumaroles are already within the chemical laboratory. Even the ash and rocks of the island will be submitted to minute investigation.

"And then there were those frightful lightning bolts! What of them and their igniting power?"

#### THOUSANDS KILLED BY STEAM AND DUST.

Prof. Israel C. Russell, another geologist who represented the Geographic Society in Martinique, says regarding the nature of the blast which swept over St. Pierre from Mont Pelée:

"It has been stated in the newspapers that the inhabitants of St. Pierre were asphyxiated by noxious gases or killed by a gas explosion. My own observations and the best interpretation I can place upon the testimony of surviving witnesses favors the opinion that the general cause of death was a blast of steam charged with hot dust. Gases, probably in part inflammable, were no doubt present, as the odor of sulphurous acid was perceptible at the time of my visit; but the part that such gases played was seemingly secondary. In order to be able to judge of the conditions where everything was destroyed, it is necessary to learn what took place on the outskirts of the storm. The people on the borders of the devastated area who escaped were in some instances injured, and the injuries were inflicted by hot dust, which on touching the skin adhered and burned. These burns resemble scalds, and destroyed only the epidermis. In several such instances the hair on the burned portions was not destroyed, and where the bodies of the sufferers were protected by even light clothing they were uninjured.

"Had the dust which struck the injured people been somewhat hotter, their clothing would have been ignited; and if they had inhaled the hot dust, death would have been almost instantaneous. The condition of the dead in St. Pierre favors the conclusion that this deduction shows what took place there. While the inhalation of

steam charged with burning hot dust may seemingly be accepted as the principal cause of death in the stricken city, it must be admitted that many persons were no doubt killed by falling walls, by nervous shock, etc.

"The blasts which swept St. Pierre on the morning of May 8, and again on May 20, passed through the city with hurricane force. This is demonstrated by the manner in which great trees were uprooted, strong masonry walls thrown down, the lighthouse overturned, etc. The direction in which all these objects were swept was a little west of south, or directly away from Mont Pelée. The most conspicuous evidence of the strength of the blast which wrought the mechanical destruction is furnished by a statue of the Blessed Virgin, referred to above. That statue,—composed, I understand, of iron, and measuring over 11 feet in height and nearly 10 feet in circumference at the shoulders, and weighing several tons,—was swept from its pedestal and carried southward about 45 feet. All the evidence collected in this connection cannot here be presented, but it indicates that the blast which wrought the havoc referred to passed over the city with full hurricane force."

#### PRIZE CORONATION ODES.

THE *Good Words* comes out this July very much enlarged in size and greatly elated in spirit at the response to its coronation ode competition. Prizes of £50, £15, and £10. were offered last Christmas. The final award was given by Stopford Brook, Edmund Gosse, and William Canton. Odes were received from 1,084 competitors, and from almost every part of the empire. The editor is almost swept off his feet by the unexpected number and widely distributed origins of these odes. "The young loyalty has come to its manhood." The empire has found voice as a unit.

"To read them, poem after poem, from all parts of the empire, is to become conscious of an imperial force the like of which history holds no record and the chronicles of the nations show no trace. Turning over ode after ode the beautiful strains of harmonious patriotism blend into a single stately imperial anthem until the reader, pausing as it were to listen, finds almost overpowering the glorious diapason of the song. . . . Very interesting, indeed, is the mingling of races and creeds, when side by side, upon a table in London, lie some eleven hundred odes, written by Brahmin and Mohammedan and Buddhist and native Christians,—negroes of the West, from the Leeward Isles and the Windward, natives of the East, Indian, Burmese and Cinghalese,—

Protestant, Roman Catholic, Dissenter, Quaker, and Jew. Their pens, some of them, would have run more readily in Tamil or Telugu, Pushtu or Persian or Arabic, but they are all in the language of the ruling race, and cramped of course though they are, they are all of them real and living in thought and sentiment. Of course, the majority of the odes are by writers of our own race. . . . Never have poets sung with such a voice before. Knowledge of the splendid responsibilities of empire with boundaries that encompass the world,—and vexed along all their length by the uncharitableness of envious neighbors or the turbulence of tribes that cannot yet understand,—give dignity to the singers and noble form to their song."

The first prize falls to Lauchlan MacLean Watt, B.D., minister of Alloa, Scotland; the second to Rev. S. Cornish Watkins, Kingston, Herefordshire; the third is divided between Lucy Eveline Smith, of Dunedin, New Zealand, and F. H. Wood, M.A., Bromley Park, Kent. Perhaps as characteristic as any is the passage in Mr. Watt's Ode on the Union Jack:

Ah, 'tis no empty fluttering of a dream,  
Our flag's proud gleam:  
Many and tired the fingers that have sewn it,  
Seam by seam,  
Staining it with life's crimson, and the blue  
Of northern skies and seas, till winds have blown it  
Wider than all their wonder and their dream.

Thin red lines of pulsing lives were the thread of it,  
Pulsing lives that bled away for its sake beneath the  
spread of it.  
Till the wide seas knew it,  
And the winds of the wide world blew it,  
And the host of England followed the flag till earth trem-  
bled under the tread of it.  
Up with it into the sky.  
Let it blow abroad, let its message fly  
Like the gray gull, over the deep,  
As glad and free.

The *Good Words* is so pleased with the success of this experiment as to offer similar prizes for the three best songs of the empire, to be adjudged next Christmas.

#### "LORD SALISBURY AS A SAINT."

SUCH is the inscription beneath a picture of statuary in Mr. F. D. How's sixth paper on Lord Salisbury, in *Good Words*. It might fitly head the entire article. "The curious and interesting statue is to be seen in the sculpture gallery of the beautiful reredos of the Chapel of All Souls' College, Oxford. The reredos was erected about forty-two years ago, at the time that Lord Salisbury had just been elected to a fellowship of all Souls', and the artist, having determined to give his saints the faces of actual

people rather than idealized features, chose Salisbury's face as his type of a Christian-warrior." Mr. How exclaims against the use of extreme partisanship on the ritualistic

No greater mistake could be made. Lord Salisbury is a high churchman, but of the most minded and charitable kind. He is not tied to the advanced school of modern ritualism; neither does he fail to appreciate at its full value the piety and learning of 'Evangelicals' whom he may not be in all matters in sympathy. It is only necessary to notice the device that he has given to the crown as to appointments to bishoprics to be assured of impartiality and wisdom of his views."

#### A RECORD BISHOP-MAKER.

And then Mr. How recalls the extraordinary fact that as prime minister Lord Salisbury has been concerned in the appointment of thirty-one bishops! This surely establishes something like a record in bishop-making. Yet Lord Salisbury used to say there were few whom he considered eligible for the episcopal bench, and of whom the Queen considered eligible, but the number for whom both he and Her Majesty thought the number was very small indeed.

#### SUNDAY AT HATFIELD.

After describing the chapel in Hatfield Hall, Mr. How proceeds:

The services in this chapel include daily morning prayer at 9:30 (the general breakfast being 10); and on Sundays an early celebration at 9:15, with afternoon service at 3:30. These services are taken by one of the curates at the parish church; but when there is no one staying at Hatfield, the morning service on Sundays is taken up, Lord Salisbury and Lady Gwendolen coming to the church instead. These arrangements are all the easier to make, as the rectory of Hatfield is held by Lord William Cecil, who recalls the fact that the rectory of Haworth was held by the son of the late Mr. Gladstone, rival statesmen each having had the happiness of being ministered to by one of their sons. Another coincidence is the circumstance that both rectories are of exceptional value."

The portrait of the rector of Hatfield has a close resemblance to the bishops of Worcester and Rochester. Mr. How has shown "the strong attachment of Lord Salisbury to the church":

His love for her has always been sincere and unostentatious. He has made few professions, he has not taken prominent part in her services except as a regular worshiper, but the

one thing which has had the power to rouse him to an outburst of indignation has been an attack upon her by her so-called friends."

#### SAINT AND SCIENTIST IN ONE.

It is significant that this devout churchman and maker of bishops has been at the same time and in this critical age a noted man of science:

"What is sometimes called 'Lord Salisbury's den,' consists of a laboratory, a dressing room, and a bathroom on the ground floor. Though not nearly so much used of late years, there yet remains plenty of evidence in the paraphernalia of the former of the industry with which at one time its occupant pursued his scientific researches. It has already been stated that Lord Salisbury is a geologist of the first rank. He has also given time to photography, and to the practical study of electricity; the splendid electric lighting at Hatfield House having been carried out under his direction."

#### HIS PERSONAL HABITS.

Mr. How brings to a close in the July *Good Words* his valuable series of sketches of the veteran premier. He touches on several personal characteristics. He first mentions Lord Salisbury's calm, and next his good health:

"Always an advocate of regular exercise, he still tricycles every morning when the weather permits, and at 8 o'clock is to be often seen thus wheeling along the London streets before the traffic of the day has assumed formidable proportions. Some years ago he was a tennis player of some repute."

His "mental aloofness" comes in for frequent comment:

"Trifles are not allowed to disturb his reveries. An eye-witness described how she watched him walking up and down the platform at King's Cross, while the rug which he carried trailed along the dusty pavement. At last a man approached and said, 'I beg your pardon, sir, but your rug is trailing on the ground.' 'Ah!' said Lord Salisbury, with a smile, 'it generally does.' This little story forcibly reminds one of the occasion when Dean Stanley, who was staying away from home, came down to dinner with his collar hanging down attached by one button only. His hostess went up to him, and gently pointed out the fact. 'Do you object?' said Dean Stanley. 'Oh, no!' was the only possible reply. 'Well,' said the dean, 'no more do I!'

"In addition to this 'mental aloofness,' as it has been called, Lord Salisbury is extremely short-sighted, and is also one of the shyest of men. When traveling in a train he buries himself instantly in a book,—probably a novel, for

he is a great reader of this class of literature,—and spends much of his spare time when indoors in this manner. Music and art have few attractions for him. He has, indeed, been known to express his inability properly to appreciate the compositions of Wagner!

"When he is at work he is, however, a different man. He is phenomenally rapid, not only in his grasp of a subject, but also in his method of getting through his business. He writes far more letters himself than is usual for a man in his position, although he still (since, that is, he has resigned the Foreign Secretaryship) retains the services of two private secretaries."

His relation to boys mentioned in the following paragraph will come as a pleasant surprise to many:

"Of Lord Salisbury's attachment to his family it is scarcely fitting to speak during his lifetime, but it is well known that it is intense. His fondness of children is perhaps less notorious, but is none the less true. He is especially 'jolly' with boys. There is one tiny bit of evidence in Hatfield House that the young ones are not forgotten, for a miniature children's billiard-table occupies a prominent position in the cloisters."

These sketches will be read with intense interest by men and women of all political parties, and will help to deepen the personal regard entertained for the venerable statesman.

#### DOES BRITAIN STARVE HER BLUEJACKETS?

THE question of food for the men who man her fighting ships is becoming a burning one in England. Mr. Arnold White, after making a special investigation in Germany, states in the *National Review* for July that "a sufficiency of well-cooked, plain, good food, equal to their necessities, is given to the bluejackets in the German, American, and French navies."

But, it will be said, was not the whole subject inquired into? It was, and certain recommendations were made, which will not be carried out until some time next year. Mr. White says:

"The committee were desired to inquire into the sufficiency of the present ration. The ration was pronounced insufficient. They were desired to inquire into the question of meal hours. It was recommended that there should be five recognized meal hours instead of three, as at present, and that the time allowed for these five meals should be three hours thirty-five minutes instead of two hours thirty minutes allowed for the three meals at present. Under the present system no food is served out by the state to the British bluejacket after 4.15 P.M. If he feels hungry between 4.45 P.M. and his cocoa-time

next morning, he is compelled to buy what he wants at the canteen and stint his wife or himself of other things."

"The private outlay of the seaman, stoker, and marine is not less than 6d. a day, and it does not seem that this aspect of the problem has been taken into consideration by the Rations Committee. Surely every possible influence should be brought to bear on Parliament and on public opinion to increase the amount due from the country to the navy for the leveling up and improving of its rations."

#### BRITISH AND GERMAN NAVIES COMPARED.

THE English reviews are publishing comparisons of the British with the German navy which are by no means flattering to the former. Herr Ernst Teja Meyer's "Los von England," a translation of which appears in the *Contemporary* for July, declares that, "apart from the number of ships, England's navy will find a superior enemy in the marine of every great power which is abundantly provided with all that gives force at sea."

#### THE BRITISH FLEET "MADE IN GERMANY."

Herr Meyer passes in review the whole British fleet, and its bases, the coaling stations, etc. He maintains that in every respect the establishment, when weighed in the balances, is found wanting. In everything but numbers England's navy is inferior to those of other nations, and, Herr Meyer would have us believe, immeasurably inferior to that of Germany. England cannot build her ships without buying materials from Germany. The guns and shells are bought from Krupp and Erhardt. Steel for English bayonets comes from Solingen, brown powder from Westphalia, and new boilers for the ships are to be supplied by German workshops. It is also recommended that armor plates should be bought from Krupp. The whole British navy, so far as there is any good in it, according to Herr Meyer, will soon have to be labeled "Made in Germany," while Germany, for her part, builds her ships from her own resources in her own shipyards, with her own workmen, and is independent of England and every other power.

#### A MERE PLAYTHING.

Not only are the British ships inferior in the weight of broadside and in tactic value to the German ships, but so many accidents and mutinies take place on British vessels as to reveal a state of things which recalls the sorry and deplorable condition of the Spanish navy at the outbreak of the war with the United States.

The British fleet is little more than a national plaything. Instead of naval maneuvers and squadron practice, there are holiday cruises from port to port, in which everything is subordinated to regattas and banquets. Herr Meyer maintains that the British naval officer would come out of action just as hopelessly discredited as his military brother.

"To most officers in the British navy the service is but a business. They all suffer from their hereditary complaint,—national pride, together with an inordinate self-conceit, an incredibly boorish ignorance, and a scorn of all foreigners."

#### BRITISH SAILORS MUTINIOUS.

The bluejackets are, Herr Meyer admits, better than the "mercenary blackguards in red or in khaki" who are recruited for the army. But it would be almost an insult to compare them with German sailors, for "they lack, above all, that deep moral seriousness with which our bluejackets win hearts the world over; that unselfish devotion; that firm, I might say pious, sense of duty." The men are discontented, and rightly so. On the one hand, they are treated arrogantly and offensively; on the other hand, they are neglected. The English fleet is the only one in the world in which serious mutinies occur.

But Herr Meyer says that on the *Majestic* the entire crew rose because shore-leave was refused; and in the flagship *Barfleur* the crews mutinied because they got nothing out of Peking plunder. Whether the men are bad or good, there is not half enough of them. The question of *sonnet* is entirely unsolved. Therefore, Herr Meyer concludes that the navy of England is just a little prepared for hostilities as the army, and it will fail just as much, though it is certainly incomparably better than "those hordes which despise everything most needed for the maintenance of a world power and a civilized state. Midshipmen should prove themselves strategists."

Herr Meyer says, and he concludes by saying that the English will not listen. They despise plain lessons and experiences; they are coming to a collapse in a war with a European power which will at last and forever demolish the old boast, "Britannia rules the waves."

#### British Estimate of the German Navy.

Archibald S. Hurd contributes to the *Century* for July a very good article "The Kaiser's Fleet." His study is largely comparative, for while he speaks of the German navy he has always the British navy in his eye. The German navy bill

of 1900, which authorized an expenditure of \$365,000,000 on new men-of-war and \$65,000,000 on dockyards, in which they can be prepared, contrasts very favorably with the British Naval Defense Act, inasmuch as the German measure takes account of all the needs of the fleet which it is to create. It makes provision for every detail of the ships down to the last rivet, while the extension of the organization of the great naval ports will proceed *pari passu* with the construction of the men-of-war. In 1920 the German navy will consist of 38 thoroughly modern battleships and 17 older reserve battleships, making 55 in all. Behind these battleships there will be 52 cruisers. In that year the British navy will only be three battleships stronger than that of Germany. Germany will, therefore, be the second greatest naval power in the world, and her battle squadrons will exceed in value such ships as England will be able to allocate to the defense of the near seas. The preamble of the navy bill shows that the purpose of the German fleet is to be strong enough to cope with that of Great Britain.

#### THE GERMAN FLEET UNDER INSPECTION.

Mr. Hurd speaks very highly concerning the efficiency of the fleet and the inspiration which it receives from the Kaiser. During the visit of Prince Henry to Ireland, Mr. Hurd had an opportunity of seeing the German ships at sea. He says that their color is the nearest approach to invisibility which can be obtained under the usual conditions. The painting of the ships is provided for out of the national funds, whereas in the British navy much of the expense falls upon the officers. One feature of the German ships is that there is no wood to be holystoned, and no brasswork to be polished by the crews. From end to end of the ships there is no gleam from a square inch of metalwork, brass, or steel. The weather decks are laid with a light reddish colored cement, which can be cleansed easily by the turning on of a hose. The cement will not splinter or ignite under gunfire, and nothing can look smarter than this hard and even material. There are very few wooden fittings, and though the insides of the cabins are made of wood, these could be cleared away in a few hours before going into action. The comfort of the crews is considered more than in British ships. The vessels are ventilated mechanically in hot weather, and heated in cold weather by pipes that run everywhere. There are baths for the officers, and for the men numerous hand-basins with water laid on in comfortable airy spaces. The food is good, is supplied in excellent quality and in ample quantity. The men have

ferent diet every day, and enjoy their meals; nor do they need to supplement their rations at the canteen out of their own pockets.

"In summary the German navy reveals some admirable points. It is a force which is hampered by few traditions. It exists with one object only,—to fight and to win. It may be that it has glaring faults; we may be sure that it is not perfect. Its seamanship certainly is not yet as high as that of the British fleet, and probably other holes could be picked in its training; but the fact remains that it is trained with serious purpose, that all smartness for mere smartness' sake is swept away, and among the sea forces of the world it marks in several important particulars the highest state of efficiency yet attained."

#### THE CASE AGAINST BRITISH PROTECTION.

THERE is a characteristic free-trade article by M. Yves Guyot in the *Contemporary Review* for July. M. Guyot, of course, is a free-trader as regards all countries, but he is in particular convinced that the continuance of the free-trade policy is an essential for England.

He begins his paper by pointing out that this is not the first time there has been a scare over British trade. A book on "The Decadence of England" was published in 1851, on the eve of a development of prosperity of which the most optimistic could not have dreamed. Englishmen living in a free-trade country are so used to its blessings that they do not notice them. Much of the protectionist advocacy is based upon the fallacious doctrine of the balance of trade. In the past the clear-sighted policy of Englishmen was adjusted to the progress of industry, while the political economy of the Continent aimed at annihilating it.

The protectionist nations are guilty of a monstrous self-contradiction when they establish telegraph lines, build railways, and subsidize ships, and at the same time neutralize this machinery by measures designed to prevent the entry of foreign goods. The logical protectionist must regret the good old times, when six or seven hundred thousand American Indians lived where seventy-six million inhabitants now dwell in peace and activity. The protectionists complain that the Americans are making themselves self-sufficing economically. But the Indians were still more self-sufficing, yet England had no trade with them. English protectionists cannot wish to close English ports against foreign raw material.

The example of the United States is an argument in favor of free trade. Among the nations in an advanced stage of evolution it forms a group of nearly eighty millions of individuals

who are not isolated in compartments by custom-house barriers. It is not the tariffs that have built up American industries,—they have only served the trusts; and in lessening the power of purchase of a portion of the Americans they have only impeded their rise instead of favoring it.

M. Guyot gives some remarkable figures to show the effect of state interference upon the price of food. In Austria-Hungary, export sugar is worth 21 crowns at Trieste, and sugar for home consumption 84 crowns at Prague. In France, the French consumer pays for 100 kilos of sugar more than 65 francs, 36 of which go into the treasury in order to promote the production of more sugar. M. des Essars has made a comparison between the retail prices in London and in Paris of forty-six articles of grocery. The total of the French prices came to 109.95, that of the English only to 89.09.

#### SPEED RECORDS ON AMERICAN RAILROADS.

STATEMENTS that American express trains have run at the rate of 75, 100, or even 120 miles an hour have been repeatedly circulated in Europe, and in Germany the state railway management has been severely criticised for its failure to equal these alleged records of speed. Writers in the German periodicals, on the other hand, have challenged the accuracy of the statements, and, in some instances, have convicted their authors of gross exaggeration of the facts. The discussion has at least shown the lack of well-attested records of such performances. In the *Journal of Political Economy* for June, Mr. George G. Tunell analyzes a recent attempt in the *Archiv für Eisenbahnwesen*, an official publication of the Prussian ministry of public works, to disparage the claims of American railroads as to the speed of trains.

Whether or not the Prussian authority successfully impeached the value of the records in dispute is a question of minor importance. Mr. Tunell is himself skeptical as to the accuracy of the extreme records quoted. He would not, he says, accept any statement of speed in excess of 85 miles per hour over level track, unless it was satisfactorily vouched for. This admission indicates the writer's cautious habit. The significant passages in his article are his statements regarding speed records which he regards as satisfactorily attested. The most recent instance cited by him is the following:

#### HIGH SPEED ON A WESTERN ROAD.

"During April and May of the present year (1902) some tests were made on the Chicago & North-Western Railway to ascertain the speed

between stations of their fast mail trains running between Chicago and Council Bluffs. The tests were made by Mr. Robert Quayle, the superintendent of motive power, who was assisted by Mr. Percy H. Batten and Mr. Horace H. Newsum, both of whom have had considerable experience in taking records. The speed recorder used was carefully adjusted and tested in the shops, and, after being placed on the engines, was checked with a stop-watch over stretches of track that had previously been carefully measured. On many occasions a speed of 75 or more miles an hour was recorded, and on one trip a speed of 82, on another a speed of 86, and on another a speed of 89 miles per hour was attained and held for a short distance.

"On April 28, train No. 10, between Carroll and Boone, in Iowa, ran six miles, five of which were consecutive, at a speed of 76 or more miles an hour, and for one-half of a mile maintained a speed of 82 miles per hour. The speed over the five-mile stretch was as follows for the successive miles: 76, 78, 81.5 (.5 of this mile being at 82), 78 and 76. On May 1 the record of April 28 was surpassed, 10.5 miles, 7.5 of which were consecutive, being run at a speed of 75 or more miles per hour. On this run a speed of 86 miles per hour was attained, but was held only for a very short distance, scarcely one-quarter of a mile. The speed over the 7.5-mile stretch was at the rate of the following miles per hour for the successive miles or parts thereof, 75 (for .5 of a mile), 77, 78, 81, 84 (for 1.3 miles), 86 (for almost .25 of a mile), 83 (for .5 of a mile), 80, and 77.5. On May 10, the record of May 1 was surpassed by train No. 9. Of the 202 miles between Clinton and Boone, 82.5 were covered at a speed exceeding 70 miles per hour, 13.5 at a speed exceeding 80 miles per hour, and 4 miles at a speed exceeding 85 miles per hour, a speed of 89 miles per hour being reached and held for about one-fourth of a mile between the stations of Mt. Vernon and Cedar Rapids."

These runs were made with four cars, by locomotives having 19 by 26 inch cylinders, 80-inch driving wheels, and a steam pressure of 190 pounds, the total weight of each engine being approximately 133,800 pounds.

#### THE "LAKE SHORE" RECORD OF 1895.

Mr. Tunell also refers to the famous run made by the special train of Dr. W. Seward Webb over the Lake Shore & Michigan Southern Railway on October 24, 1895. The official timekeepers of this run were Mr. H. P. Robinson, editor of the *Railway Age*, and Mr. Willard A. Smith, sometime chief of the transportation department at the Chicago World's Fair. Note-

worthy records made on this run were as follows:

A distance of 510.1 miles at 65.07 miles an hour.
A distance of 289.3 miles at 66.68 miles an hour.
A distance of 181.5 miles at 69.67 miles an hour.
A distance of 85 miles at 72.92 miles an hour.
A distance of 71 miles at 75.06 miles an hour.
A distance of 59 miles at 76.08 miles an hour.
A distance of 52 miles at 78.00 miles an hour.
A distance of 43 miles at 79.04 miles an hour.
A distance of 33 miles at 80.07 miles an hour.
A distance of 8 miles at 85.44 miles an hour.

The train was composed of two heavy Wagner parlor cars, each weighing 92,500 pounds, and Dr. Webb's private car *Elsmere*, which alone weighs 119,500 pounds. All the engines used in this relay race were built by the Brooks Locomotive Works, after designs furnished by Mr. George W. Stevens, of the Lake Shore Railway. The first four engines, which drew the train as far as Erie, were of the American type, or eight wheelers, comparatively light, but built for fast running. These engines weighed only 52 tons, had 17 by 24 inch cylinders, and 72-inch driving wheels. The last engine was of a different type, being a ten-wheeler, with three pairs of coupled drivers and a four-wheeled swiveling truck. It weighed 56.5 tons, its cylinders being of the same size as those of the other engines. Its driving wheels were only 68 inches in diameter.

#### FREIGHT RATES ON ARGENTINE WHEAT.

IT was only a few years ago that the Argentine Republic gained recognition as a serious competitor with the United States in the supply of wheat for European consumption. The fact that among all the transoceanic sources of wheat supply for western Europe Argentina now ranks second only to the United States has attracted the attention of statisticians, and efforts have been made to ascertain the causes of this rapid and unheralded development.

The cost of transportation is, of course, one of the most important elements in the situation, but heretofore there has been no serious attempt to compare the freight rates from the farms of Argentina to European ports with those from the wheat belts of the United States to the same ports. Such an attempt has recently been made, however, by a Washington statistician, Mr. Robert R. Kuczynski, and the results of his investigation appear in the current number of the *Journal of Political Economy* (University of Chicago Press).

In the introductory part of the paper there is a table giving for the last two quinquennial periods the average yearly wheat crop of all the countries

having an average annual output of more than 50,000,000 bushels.

Countries.	Average annual crop in 1,000 bushels.			Percent- age.
	1891-95.	1896-1900.	1891-1900.	
United States .....	490,246	540,503	515,375	20.00
European Russia.....	369,632	370,043	369,838	14.35
France.....	299,563	324,737	312,150	12.12
British India.....	247,982	215,186	231,584	8.99
Hungary.....	148,017	127,701	137,859	5.35
Italy.....	120,427	125,432	125,930	4.89
Germany.....	107,846	132,126	119,986	4.66
Spain.....	87,144	98,942	93,043	3.61
Asiatic Russia.....	77,332	85,885	81,608	3.17
Great Britain.....	50,969	62,755	59,877	2.32
Argentina.....	53,000	63,939	58,469	2.27
Roumania.....	57,053	49,725	53,389	2.07
Canada.....	51,406	53,913	52,660	2.04
All other countries....	372,787	356,729	364,757	14.16
Total.....	2,645,434	2,907,616	2,576,525	100.00

From this table it appears that Argentina's wheat crop is only 2.27 per cent., or one forty-fourth of the world's total wheat product. This fact, taken by itself, might lead the superficial reader to infer that the South American republic can never become formidable as a competitor with the United States, where 20 per cent. of the world's product is now annually raised. It is only when we consider the question of home consumption in the various wheat-growing countries that we can form an adequate idea of their relative importance as exporters. Argentina has, in fact, a smaller population than that of any other of the twelve countries included in the table. It has, therefore, a smaller need of wheat for home consumption. From the data obtained by the Argentine Department of Agriculture, it appears that only about 31 per cent. of the wheat crop is consumed within the country, and 9 per cent. is used for seed, leaving 60 per cent. available for export, while in the United States only about one-third of the crop can be exported. Hence the fact that the present export of wheat from Argentina is only exceeded by that of the United States and Russia. In the last decade (1891-1900) the average annual export of domestic wheat from the United States and Russia amounted to 102,000,000 bushels each, and from Argentina to 35,000,000 bushels.

**ARGENTINE WHEAT LAID DOWN IN EUROPE FOR  
LESS MONEY THAN THE NORTH AMERICAN  
PRODUCT.**

On the subject of transportation charges, it is impossible, in the space at our disposal, to do more than quote the conclusion of the very elaborate discussion presented in the *Journal of Political Economy*:

"The freight rate on wheat from the local station to the ocean has been estimated for Ar-

gentina at 7 cents, for the Pacific coast region at 10½ cents, for the wheat territory east of the Rocky Mountains at about 14 or 15 cents per bushel. If to these rates the different average ocean rates are added, the total freight rate per bushel of wheat to the English market would be from Argentina about 16 cents, and in the United States for the wheat shipped over the Atlantic ports, about 20 cents; over the gulf ports, about 22 or 23 cents; over the Pacific ports, about 30 cents.

"The conclusions which might be drawn from the preceding study may be summarized as follows: It seems that the cost of hauling the wheat from the farm to the local station is considerably lower in Argentina than in the United States; that the cost of transporting the wheat from the local station to the shipping port is lower in Argentina than in the Pacific coast region of the United States, while it will be about as high as that of transporting the wheat grown east of the Rocky Mountains on a local rate to the primary market; that the ocean rates from Argentina are considerably lower than those from the Pacific coast region, and that therefore the cost of transportation from the local station in Argentina to Europe is considerably lower than from the local station in the Pacific coast region to Europe; that while the ocean rates from Argentina are higher than from the Atlantic and gulf seaports, the difference is by far not so large as the freight rate from the primary market to the ocean in the United States; that as a consequence hereof, even if account is taken of rebates and of the existence of through rates from local stations to the ocean, the transportation from the local station in Argentina to the European market is likewise lower than from the local station east of the Rocky Mountains to Europe, and that consequently the average rate for transporting the wheat from the Argentine farm to the European market is lower than from the farm in the United States."

**HOW TO SAVE A DROWNING MAN.**

IN *Outing* for August, Mr. Alexander Meffert tells how to go about saving a drowning person. In the first place, he shows that the direct danger of cramp seizure is not at all so serious as swimmers suppose. Nearly every swimmer seized with a cramp could save himself if he did not get frightened. Cramp comes from going into the water when overheated, from swimming with a stomach full of undigested food, or from staying too long in the water and taking a chill. It attacks only a leg or an arm, or perhaps only a foot or a hand. Any good swimmer could get

along with such a handicap if he did not get frightened; but nearly every one gets frightened, thrashes around, and fills his lungs with water.

Mr. Meffert says the great thing in trying to save a person in danger is to take one's time at the rescue. A little water swallowed by the drowning person will not hurt, and to swim right up to him invites the one great danger of his grasping the rescuer, which practically always means the death of both.

Mr. Meffert says the proper way is to swim up to the struggling man, but to keep out of the reach of his arms until he has become incapable of violent effort. If he tries to seize hold of you, the left hand should be put against his lower jaw to push him away.

When the drowning man seems to be quiet, the best way is to take him by the hair with the left hand and swim ashore with your right. If his hair is too short, then the back of his coat or shirt collar is the proper place to take hold. If there are neither clothes nor hair to afford a grip, the safest way is to approach from behind, put one of your hands in each of his armpits, treading the water meanwhile, and then pull the drowning man back until he is floating face up, at the same time bringing your feet upward and forward until they are under the other's body. Then you swim on your own back, dragging the unconscious man. This cannot be done with very heavy people, of course. In such a case the best way is to take hold of his left hand with your left hand, turn and swim, dragging him after you, but this has a danger of making it easy for him to grasp you.

#### THE LEGION OF HONOR.

**I**N the first June number of the *Revue de Paris*, M. Aulard contributes some interesting pages concerning the centenary of the Legion of Honor. This great French order, admirably named by Napoleon, was instituted by him on May 19, 1802. It was an attempt on the part of the First Consul to reconstitute at least one of the old honorable distinctions which have played so great a part in monarchic France, and it was intended to take the place—as, indeed, it has done during a hundred years—of the three great French orders,—that of St. Michael, that of the Holy Ghost, and that of St. Louis. The last of these, founded in 1693, was purely military, but was only given to those who could prove themselves possessed of four quarters of nobility.

Only Catholic soldiers could receive this distinction, an exception, however, being made in favor of officers belonging to Swiss regiments. During the Revolution such distinctions were

abolished, with the one exception of the Society of Cincinnati, which had a brief run, being copied from the American military decoration of that name. Napoleon, even as First Consul, was most anxious to revive some form of honorable distinction which should replace the old cross of St. Louis; accordingly, when he considered the time was ripe, he let it be known that a new order was about to be instituted, of which the members would bear the honorable name of Legion of Honor. The proposition provoked a considerable amount of opposition, but of course there were many more who approved than who disapproved, and once Napoleon became Emperor the Legion of Honor became one of his most cherished institutions, and he reserved to himself the right of bestowing "the cross," as it soon became universally known, on those who seemed to him worthy of it. Probably few people are aware that at first it was considered advisable to make the knighthood obtained by the reception of the decoration hereditary, and that not only to legitimate children, but to natural children and even to adopted children. This absurd suggestion was soon brushed aside by the Emperor's good sense.

Under Napoleon nearly fifty thousand individuals belonging to all grades of society were enrolled in the Legion of Honor, and of this large number only fourteen hundred were civilians, the cross remaining essentially a military decoration. Napoleon founded many other orders; notably in Italy that of the Iron Crown. Yet another order of knighthood of a very exclusive character was known as the Three Golden Fleeces, and was only bestowed on the highest knights created. Yet a third order, which went by the absurd name of the Reunion, was intended to be equally suitable for bestowal on the great personages of all those countries whom the great conqueror annexed.

Now, as most people are aware, the Legion of Honor has become the one great honorific distinction possessed by France. It has rather unfortunately changed in its original character. Thus, it is bestowed as a matter of course on all those worthy civilians who have served the state and public offices for a certain number of years. Again, a great number of crosses were rightly given on the field of battle during the Franco-Prussian War, and were thus the reward for conspicuous gallantry in action. Occasionally a signal act of personal courage, such as the saving of a number of persons from drowning, will secure some modest village hero the much-coveted decoration. A very limited number of French women have been given the cross; of these, perhaps, the best known outside the limits of her own country was the late *Rosa Bonheur*.

### DARWINISM AND EMPIRE.

OUR readers will remember how Mr. Rhodes evolved the idea of imperialism from what he believed was the fundamental principle of Darwinism. Mr. Ramsden Balmforth, in the *Westminster Review*, writes on the subject of "Darwinism and Empire," without referring, however, to Mr. Rhodes. He maintains that Darwinism and the evolutionists have been father to the doctrine which they would have been the first to repudiate. The average man is apt to think that fittest means best, whereas it really means that which is best adapted to the conditions of its environment. The idea that fitness and selection can be determined by strength, military power, cunning, or even intelligence is inadequate, for the environment of man, the moral or spiritual shell in which our lives are cast, demands morality, an ever-ascending type of morality, from us, or we perish. As Darwin himself says, a tribe rich in moral qualities would spread and be victorious over other tribes, and its social and moral qualities would tend slowly to advance and be diffused throughout the world. According to evolutionary ethics, it is with nations as with individuals: nor strength nor cunning, nor intelligence alone, but character determines fitness.

What kind of character is it, then, asks Mr. Balmforth, which determines fitness? Not, he answers, the pushful, cunning, trading character, or the self-righteous, proselytizing character, but rather the restrained, self-contained character, which is content with a modest competence, which seeks righteousness rather than gain, which keeps its word even to its own temporary hurt, and which is the friend and defender of weak and struggling nationalities. Mr. Balmforth does not think that England's policy either in South Africa or in China has been such as to promote the survival of the highest types of character. In both countries England was the original aggressor. And to attempt to persist in securing success is to promote the survival of a low filibustering type of character. It is no use for Englishmen to say that they have gone so far they cannot turn back. Nature will allow no excuses of that sort. The farther we go in a wrong direction the greater will be the distance over which we shall have to retrace our steps. England's war policy has not the test of fitness, which natural selection itself imposes—a test of character. Without it England would ultimately have triumphed more completely than with it, and the policy has been a decided set-back to the moral development of the race.

In China things have been even worse. Hence he thinks that true statesmanship on Darwinian

principles should aim at bringing the will, intelligence, and moral ideals into quickened activity and emulation, rather than the lower powers and activities which seem to bring out the latent instincts of the ape and tiger. The wisest statesmen are those who set their faces like a flint against the policy of war, and who, by conciliation, by conference, by arbitration, by respect for national rights, by international deputations and congresses, bring the best thought of each civilization into sympathetic contact with that of the other, and seek to resolve the conflicting elements of each in the harmony of the higher unity, and to promote the peace of the world and permanent welfare of mankind.

### THE PYGMIES OF CENTRAL AFRICA.

IN the *Atlantic Monthly* for August, Mr. Samuel Phillips Verner has an unusually readable article on "The African Pygmies," whom he has visited and studied in their native town in Central Africa, on the Kasai River, a tributary of the Congo. These are the true pygmies of Herodotus, the fabled dwarfs of Ethiopia. The little folk lived in a city called Ndombe, ruled over by a king of the same name. There are about 5,000 in the city, and 300 more around it. They dwell in little huts shaped like a beehive, with an opening on the side at the bottom, barely large enough to admit their bodies crawling. Although a full-grown negro could not even lie down at full length in such a house, one of them suffices for a pygmy and his whole family, sometimes consisting of a wife and half a dozen children.

The pygmies are occupied almost solely in hunting and fishing, their chief weapon being a bow and poisoned arrows. These arrows have no heads except the mere sharpened point of bamboo, but they are dipped into a vegetable decoction which is one of the most fatal poisons known, and which produces insanity or death almost immediately, even if the arrow makes not much more than a scratch.

The pygmy community is ruled by a giant king, Ndombe, who stands six feet six inches in stature, with broad, square shoulders, Herculean limbs, and massive statuesque features of a distinctively Egyptian cast. Mr. Verner says he has never seen the man's physical superior. He has thirty-one wives and over forty children, and his family connections are so extensive that they occupy a whole town. The pygmies themselves, however, do not usually have more than one wife.

The clothing of the little negroes was the most primitive imaginable. The children and some of the women went nude, and the most elaborate costume amounted to nothing more than a yard

fiber around their loins, this garment lined from the other natives.

Average height of fifty grown men of the village was fifty-one and seven-eighths of four feet and nearly four inches. These were less than three feet and nine inches, and five of them were over four feet.

It was very difficult to persuade the natives to submit to measurement, but eight of the heads of families, averaged forty-seven and seven-eighths inches, four inches shorter than the English men. The prevalent color was a light brown. The older men wore scanty

clothing. The pygmy is of the brachycephalic type. The mean cranial index of the skulls of the males was eighty-one degrees. The skull was small, but more aquiline than that of the English.

The mouth was large, and the chin projecting. The hair was of a lighter color than most a shade of brown,—and was kinky. Their hands and feet were small. Their hands, the hands in particular being shaped, the hands in particular being formed. In proportion to their size, the strength far exceeded that of all the other races.

Their powers of endurance on the march in the chase were phenomenal. Fifty miles was an ordinary march for them, and almost as much at home in the trees as in the open. They rely on themselves. The senses of the pygmies are unusually acute. At quite a distance, they can distinguish the chameleon from the lizard, which it was hidden, notwithstanding that the color of the little animal coincided with that of its hiding-place. Much of their success is discovered through the powers of the sense of smell was as keen as that of the dog.

They were such shots with the bow that they could send an arrow through a rat's eye at fifty yards, while it was running across the ground. The Bantu would spear fish as they were in the water, or darted among the rocks and reefs.

Mr. Archer cites the scientific fact that no human beings have been found of any human beings like the pygmies. It is certain that the little people were apparently preserved and enjoyed a continuity for five thousand years. He does not attempt to decide between the various hypotheses as to the origin of the pygmy race, holding that the ancestors of the pygmies were men, and that the present dwarfs represent a separate race, and others that the pygmies have been unchanged from their creation. He is content to know that the Kasai valley has recently been opened to steam navigation, and that the river having been built at Rich-

mond, Va., and that the ethnologists will have a good opportunity of making a thorough study of the peculiar race of men.

#### AN ENGLISHMAN'S PLEA FOR A NATIONAL THEATER.

MR. WILLIAM ARCHER contributes to the *Monthly Review* for July an earnestly written statement of the case for national theaters. By this he means that theaters should be created in every center of population, which would not be conducted simply for the benefit of individuals, but should be held in trust for the public at large by some representative body, which, directly or indirectly, should control them. As libraries, museums, and picture galleries are public institutions, so the theater, ought to be one of the intellectual glories of the English-speaking race, must also be a public institution. The drama flourishes best in countries like Germany and France, which treat it as a public concern.

#### THE COST OF THE MODERN THEATER.

Mr. Archer points out that for any play to succeed it must attract at least 50,000 spectators in the course of three months. Plays that do this succeed, plays that do not fail. What chance, asks Mr. Archer, would there be of Mr. Meredith or Mr. Hardy being able to place a new novel before the world if they had to find fully 50,000 purchasers in the course of three months, incurring an initial outlay of from £1,000 to £3,000, and to publish a fresh edition every day at a cost of £100? The consequence of the theater being run solely as a money-making institution is deplorable. Mr. Archer says:

"Can it be doubted, for instance, that 'musical comedy,' English and American, does more than ten thousand pulpits can undo to glorify and enforce the sporting, gambling, bar-haunting, champagne-drinking, flashy, and dissolute ideal of life which dominates that class of production? Do we not see whole regiments of young men modeling themselves in dress, manners, vocabulary, and, as far as possible, in morals, upon this or that popular comedian whose leering inanities they regard as the last word of human wit?"

#### MR. ARCHER'S SUGGESTION.

This, indeed, is a canker of the commonwealth. In London musical extravaganzas has almost completely swamped the higher forms of drama. It is a political force, and draws the whole English-speaking world together in the bonds of racial

vulgarity. Mr. Archer hopes that the idea of an endowed theater will find practical expression in some pioneer city from the coöperation of private munificence with public intelligence. He says:

"Could there be an object of greater public utility than that of rendering the most fascinating and universally popular of the arts a source of intellectual and emotional, as well as merely sensuous and sensational, pleasure?

"The realization is gradually spreading among us Anglo-Saxons that a well-ordered theater stands high on the list of institutions indispensable to an enlightened community.

In Germany the ideal of the theater as a public institution, not a private money-making machine, has always triumphed and pulled things together. The result is that the German theater of to-day keeps the classics of German literature constantly before the people; treats Shakespeare far more intelligently than we do ourselves; and has produced an extraordinarily rich and varied contemporary drama, vying with that of France, and incomparably more important, in every point of view, than the contemporary drama of England and America.

"I suggest, then, that the establishment of a repertory theater, on the lines of the German city theaters, in every considerable town (say, of 150,000 inhabitants and upward) in the English-speaking world, would be a magnificent national and racial investment, even if each theater involved a considerable annual outlay."

#### ELEVATION OF THE GERMAN DRAMA.

IN the first quarterly issue of the *Forum*, Mr. John Corbin contributes an account of the present condition and prospects of the drama in the United States. By way of contrast he pictures theatrical conditions in Germany:

"The theatrical situation in Germany is geographically the same as in America,—that is to say, there are many widely separated cities, each one the seat of a vigorous civic spirit. The commercial basis of the German theater, however, is the direct opposite of that in America. The origin of the theater was not in the great mass of the public, but in the more intelligent portion of it associated with the royal courts of Germany. In Munich, Stuttgart, Vienna, Berlin, and many other capitals there are theaters which, like the Théâtre Français, are supported in part by the national treasury. These theaters are what we should call local stock companies of the highest character; and for more than a century they have given frequent productions of the best dramas in the literature of the world, ancient and modern. Modeled upon these, in the lead-

ing commercial cities, stock company theaters have been founded which depend for support on the municipality, and even on private subscription.

#### HEALTHFUL VARIETY FOR ACTORS AND PUBLIC.

"No sooner has a play proved successful in one German city than it is rehearsed and put on the boards in all,—thus becoming a part of the repertory of twenty or thirty different companies at once. This does away at a stroke with such organization of booking as is at the root of the commercial evil of the American theater. It also does away with the long run, which is the root of our artistic evil, for the rules of the theaters generally require that even the most successful pieces shall not be played more than four times a week, in order that the rest of the time may be taken up with revivals of the classics and with productions of new plays. The actors are thus benefited by constant variety. In spite of this, however, a play is in the end given as often as there is a public to witness it, runs of one and two hundred performances being perhaps as frequent as in America. It is true that in any particular city the returns to the authors and the managers come in more slowly, but this is more than balanced by the fact that the play runs simultaneously in all the leading cities. In many other ways this system is superior to ours. The author has a score of managers to whom to offer a new play. The actor, when his abilities warrant, travels as a guest from this theater to that, availing himself of the local company and of its stock scenery. The public is constantly able to see the best old plays, and at the same time every novelty of the season. Even the mercantile classes share in the general profit, for a large floating public of well-to-do people is attracted by the great educational advantages which a repertory theater offers.

#### GERMAN ACTORS IN THE UNITED STATES.

"As for America, or at least English-speaking America, no one who knows the conservative power of established organization, even of the worst, will look for any early duplication of this system. As far as the German-speaking public is concerned, the system is to be seen in full operation: there are vigorous and successful repertory theaters in New York, Philadelphia, Chicago, and Milwaukee, and every season great German actors, such as Possart, Sorma, Odilon, Bonn, and Sonnenthal, make the tour of all these theaters as guests. But it will be many years, it is to be feared, before this admirable example is imitated by the English-speaking public."

## EDUCATION BY NEWSPAPER.

A NOVEL plan for a system of popular education has been proposed in India. The proposal is contained in a paper by Mr. S. S. Thorburn, read before the East India Association, and published in the July number of the *Asiatic Quarterly*. Mr. Thorburn's proposal is, briefly, to publish in each center, and in all the vernaculars, a government newspaper which would educate the people. At present education in India is bad, and journalism worse. Only about one in four hundred of the number of boys in India is being seriously educated, and only 10 per cent. are undergoing any education at all. At present the great bulk of educated candidates for government employment must struggle for positions worth less than \$100 a year. Education higher than elementary is almost confined to town-dwellers; the educated product is cast upon the world at an age when instruction is only beginning to expand the mind into a thinking machine; and the educated class, unfit for other pursuits, seeks clerical employment, in which the openings are few.

The reading of this new class is restricted to the cheapest of the vernacular papers, of which there are nearly six hundred. These papers pay badly, and have small circulations, while the fear of being prosecuted for seditious writing is ever before them.

## GOVERNMENT NEWSPAPERS.

Mr. Thorburn, in view of these facts, proposes that the government of each department should start and maintain a first-class daily paper in the town vernacular, which would be sold at a rate which would compare with the cheapest journals now circulating. He thinks that even if a loss of a lac of rupees in each case resulted, the outlay would be productive. The editors should be persons worthy of respect, either English or native, and such men, says Mr. Thorburn, would be cheap at 3,000 rupees a month. Mr. Thorburn thinks that after a time the loss would be inconsiderable.

## WHAT ANGLO-INDIANS THINK.

Mr. Thorburn calls this education by newspaper, but it is obvious that the effect would be political as well. After his paper was read the project was discussed by several members, none of whom approved of it. Sir Lepel Griffin said he did not think that the starting of a few newspapers would be enough to tackle the grave difficulty which the higher education of the natives was every day making more important. Mr. Digby was even less favorable. He does not

think that British newspapers make good citizens. He points out certain practical difficulties. Would the editor, he asks, have a free hand? If so, he would have to circulate damaging criticisms on the Indian Government, such as those of Mr. Caine in the House of Commons. The government would be a resounding board, through which the voice of criticism would echo through the land. The editor would be compelled to take sides, and would thus incur the enmity of one party. A large number of papers would be needed, there being eighty languages in India, twenty of which are spoken by not less than a million persons. If the papers were good, they would supersede the present English and native papers, destroying the occupation of the present journalists. Mr. Digby does not think that the men could be found to work the project. If the Indians are to become loyal citizens of a prosperous empire, they must be regarded as equals. The British cannot for all time stand *in loco parentis* to 230,000,000 people.

Mr. Thorburn, in his reply, argues that if the government newspapers were to kill all the lower-class newspapers circulating in India, so much the better. He maintains also that the newspapers would not need to be published in so many different languages, as no daily is now published except in the recognized official vernacular of a province and one spoken by all educated Indians.

The project, as will be seen, did not meet with favor. It is an interesting one, nevertheless. But surely a simpler plan, both in India and Russia, would be for the rulers to test for a time the effect of granting real liberty to the press, the most effective of all enemies of sedition.

## TOLSTOY ON EDUCATION AND INSTRUCTION.

IN *La Revue* for June 15, M. Jean Finot publishes an unrevised fragment from Count Tolstoy's pen on education and instruction. For the ideas therein he disclaims all responsibility.

## RELIGIOUS DOCTRINE THE BASIS OF EVERYTHING.

As the basis of everything should be a religious doctrine suited to the degree of instruction of men, this doctrine cannot be Catholicism, Protestantism, Buddhism, nor any creed based on trust in certain prophets.

"This doctrine must be justified by the reason, aspirations, and experience of each man. And this doctrine is Christian doctrine in its most simple and reasonable expression. . . . Everything we teach children intentionally . . . is conscious inspiration; everything which children imitate . . . is unconscious suggestion.

"Conscious suggestion is what is called instruction; unconscious suggestion is what we call, in the narrow sense, education, and what I shall call enlightenment. . . . In our society instruction is very advanced, but real enlightenment is not only backward, but absent. . . . That education may be good and moral it is necessary, strange to say, that the life of the educators should be good. It must be good, not by chance in certain details, but its bases must be good."

"A good life" he defines as one that aspires toward perfection, toward love.

#### "INSTRUCTION."

As for instruction, or science, it is merely the transmission of the best thoughts of the best men on divers subjects. Such thoughts of good, intelligent men are always about (1) religious philosophy of life and its importance; (2) experimental and natural sciences; (3) logic and mathematics.

"All these are true sciences. . . . You know or you do not know. All sciences not corresponding to these requirements, such as theological, legal, and historical studies, are mischievous, and should be excluded."

Count Tolstoy also strongly insists on the importance of teaching some manual labor, be it carpentry, sewing, or other useful employment.

#### A DIVISION OF TIME.

"This is how I represent things to myself: the teachers fix hours themselves, but the pupils are free to come or not. . . . Entire freedom for the pupil to study when he wants to is the condition *sine quâ non* of all useful teaching, is just as in eating the condition *sine quâ non* now that the eater desires to eat. The only difference is that in material things the mischief of restriction of liberty is shown at once,—by sickness and derangement of the stomach,—and that in spiritual matter the results are shown less quickly, perhaps years later."

Eight hours for sleep, eight for "education in the narrow sense—enlightenment," also housecleaning, manual work, with intervals for rest or play (dependable on age); eight hours for study, the subject to be entirely the choice of the pupils.

#### ON LANGUAGE TEACHING.

"As for the teaching of languages—the more one knows the better—I think it absolutely necessary to learn French and German, English, and, if possible, Esperanto (a universal language). Languages must be taught by making the pupil read a book he knows and trying to make him understand the general sense, then drawing attention to the essential words and their roots in the grammatical forms."

#### MARY'S HOUSE AT EPHEBUS.

IN the *Nouvelle Revue*, M. B. D'Agen gives a curious account of the ancient building at Ephesus which is now believed by many Roman Catholics to have sheltered Mary, the mother of Christ, during the last year of her life on earth.

Not quite a hundred years ago there lived in Westphalia a village woman, Katherine Emmerich, who enjoyed a great local reputation for sanctity, and who lived the life of an anchorite. She had a Boswell in the person of a humble priest named Brentano, to whom she recounted at great length her marvelous visions, which all concerned, and, as it were, reconstituted, the life of Christ and of the Virgin Mary on earth. He kept a careful record of all she told him, and after her death several volumes dealing with her "revelations" were published; these included a "Life of the Virgin Mary," in which are to be found many extraordinary and most elaborate details, which the believers in Katherine Emmerich's exceptional sanctity regard as a valuable supplement to the Gospel narrative. It should, however, be added that this volume, as indeed all the "revelations" in question, never received the *imprimata* of Rome, and no effort seems to have been made to discover whether any of the statements contained in the volumes could be verified by journeys to the Holy Land, or to the other places mentioned therein.

Twelve years ago the superior of a monastery at Smyrna happened to come across the "Life of the Virgin," and reading it with a certain incredulous interest, came upon a passage where the visionary described, with the most minute care, the house in which it had been revealed to her that the Virgin Mary dwelt, near Ephesus, during the last few months of her life. Struck by the accuracy of some of the details concerning the country, he made up his mind to seek for this spot, "some three leagues or three and a half leagues from Ephesus, situated on a mountain reached by a tortuous and narrow way, and from the top of which can be seen Ephesus on the one side, and the sea on the other." The priest and a friend started off on July 27, 1891. After a short journey they arrived at the foot of Bulbul Dag, the mountain clearly indicated by the visionary, and there, after a stiff climb, they found the building in question. The news was sent off to Rome, where, however, it was received with skepticism, greatly owing to the undoubted fact that St. Polycarp, who was Bishop of Ephesus about the year 200, made no mention in his letters to the then pope of the house in question. In Asia Minor the spot has become a great place of pilgrimage, and the writer of this interesting little paper evidently believes firmly

that here the modern world may indeed see the spot where, "after the crucifixion of our Lord at Jerusalem, the Blessed Virgin Mary, together with St. John, journeyed to Ephesus, and there spent the remaining year of her life."

#### THE SHEEP-DOG TRIALS IN ENGLAND.

THERE is a delightful article by A. Radclyffe Dugmore in *Everybody's* for August, describing "The Sheep-Dog Trials at Troutbeck," in the north of England. In this little retired village the sheep-herders of the north gather together every year to witness the trials of their collies, conducted according to the most stringent rules and regulations. The display of intelligence and beautiful training on the part of the sheep-dogs is most fascinating. Mr. Dugmore is not only a real artist with the camera, but is, as well, a wonderful observer and student of nature. The accounts of these trials are illustrated with his beautiful photographs taken at the last sheep-dog trials in August, 1901.

The task set each dog was to convey three sheep over rough ground from the starting pen for about three-quarters of a mile to the finishing pen. The route was fixed by flags, and the sheep had to be conveyed between these flags. The man whose dog was working stood on a knoll about 150 yards from the starting point, and not until his dog had gotten the sheep to the finishing point was he allowed to leave this knoll. From that distant point he had to guide his dog as best he could by signs and signals, shrill whistling, and sometimes calling.

Forty-two dogs were entered in the last trial, and Mr. Dugmore gives a vivid description of the performance of the first starter, Laddie.

The dog seemed to realize that some special effort was called for to-day, and looked inquiringly first at his master and then toward the judges' tent. He seemed to be waiting eagerly to be released. The wave of a red flag was the signal for the simultaneous release of the three penned sheep and the anxious, eager dog. At once the latter made toward the three bewildered sheep, directed first by his master's call, for the bracken was high and hid the animals from the dog's view.

"But not long before he saw them, however. Without seemingly paying the slightest attention to his master's call, he hurried them along at a lively speed. Up the stone-covered hillside they scampered till they reached the first flag. Then Laddie stopped an instant for orders,—a simple whistle which he understood,—and once more the three sheep are off, with the dog following close behind, guiding them carefully, and keep-

ing all three closely bunched together as they pass the first of a series of flags. . . . Over the top of the hill and down the slope they went, faster and faster, until, still well bunched, the brook was passed, and they were going up hill toward the first pair of flags. Then one of the sheep made a bolt toward the lower part of the crag; but Laddie turned it back quick as a flash, thereby saving much time. Once more they made for the opening between the two flags that seemed to be planted so very close together. When quite near they hesitated, and had to be urged on. As soon as they started in the right direction, Laddie lay down and watched them as they walked slowly along, leaving the flags on either side.

"Looking toward his master for new directions, he quickly overtook his charges, who were slowly making their way for the hilltop, and, turning them in the direction of the next flag, now forced them into a gallop. Over the rocks they went, sure-footed as goats, frequently lost to view among the bracken, but each time reappearing with the gray dog close at their heels.

"Nearer and nearer they came, to within six feet of the flags, and seemed to be going well, when suddenly, without warning, they galloped off on the wrong side. The bracken was so high that the poor dog had not seen the second mark. 'Coom t'ime, lad! coom t'ime!' shouted his master, and then the dog realized that a mistake had been made, and ran to a clear piece of ground, from which he could see his master and get his signals. The sheep, fortunately, had stopped soon after passing the flag, and the dog understood that they must be driven back *outside* the mark (for such is the rule), then turned sharply round and brought between the two flags.

"How he understood it is difficult for us to realize, but that he did was proved by his actions; try as the sheep might to go the wrong way, Laddie,—now coaxing, now forcing them,—soon had all three in position for starting again for the narrow way that led between the two fluttering flags.

"'T'hame, Laddie! t'hame!' called his master; and Laddie turned those sheep sharply round and brought them between the two red and white flags at full gallop."

Finally Laddie gets them within a hundred yards of the pen, and his master leaves his knoll and runs to assist in the penning. The pen has an opening only big enough to admit one sheep, and so placed as to give the worst possible angle of entrance. Moreover, the driving has to be completed in a certain time, and only one minute and twenty seconds remains.

"J. R. stood on one side of the pen and beckoned Laddie to bring the three scared-looking

sheep forward. Slowly they came until near the goal; then, before man or dog could stop them, all three bolted past, and fully half a minute was lost in bringing them back.

"At last, by coaxing ever so gently, they were taken to the pen, and two were passed through the narrow entrance and penned. The third, however, turned at the critical moment and bolted.

"Time was nearly up; but a few seconds remained. Could the animal be recovered before those seconds had passed?

"The spectators held their breath and watched intently; the time-keeper stood, watch in hand, ready to call the fatal word 'Time,' while the man and the dog were working with nervous energy. It was a race against the second-hand of a watch, and the odds were in favor of the second-hand. Fortunately the two sheep in the pen had remained there, so the undivided attention was given to bringing in the third, which had run about fifty yards before Laddie could turn it. Back they came, the driven and the driver, until once more they were close to the pen. Then the dog dropped down, with his head on his paws, watching the sheep as it stood near the narrow entrance.

"Nearer and nearer came the man, with arms outspread, while the dog crawled on his belly toward the staring, panting sheep. Once the sheep turned, as though to run, when, quick as a flash, Laddie stood up and took a step forward, ready to cut off the retreat; but the sheep, thinking better of it, turned toward the pen, and, after hesitating a moment, slowly entered, one second ahead of time."

Our friend Laddie, however, did not win the prize on this day. It went to an old dog named Jack, "who gave one of the finest exhibitions of the day, making some wonderful retrieves, keeping his sheep well in hand while he completed the course and the penning in seven minutes and thirty seconds."

#### MOVEMENTS OF BRAINGLESS ANIMALS.

THE purposefulness and control of the movements of animals from which the brain has been wholly or partially removed is the subject of a paper by Dr. L. Merzbacher, in the last number of the *Archiv für die gesammte Physiologie des Menschen und der Thiere*.

What the physical basis of consciousness is, and how bodily activities are incited and controlled, are questions which have always both interested and eluded learned men. The Chinese held the belief that the stomach was the seat of the mind. In later times the doctrine of the

spirits prevailed among European nations, according to which thought and motion were caused by a fluid that passed out from the brain through a system of tubes in the body and back to the brain again. After that scientists took up the study of anatomy, and mere theorizing became unpopular. From anatomical studies it seemed that the brain was a great mass of nervous material that exerted a controlling influence over the body, responded to stimuli, and originated impulses which were conducted through the body over nerves extending out from the brain. We are now turning away from this extreme view of the controlling influence of the brain, in the light of certain experiments made upon animals with mutilated brains, and with the present diversity of opinion the scientist may say with the poet that he has come "*Wo er nichts Festes zu erfassen weiss*."

For the studies described, a number of frogs were chloroformed, their skulls opened, and parts of the brain removed, after which the frogs were cared for until they recovered. Those frogs from which the cerebral hemispheres and optic thalami had been wholly removed were able to use their legs as well as before, making all customary movements, and coördinating the movements with each other. Operations upon both the brain and the posterior roots of the spinal nerves that extend into the legs produce a marked effect upon the movements, the hind legs doing as they will, sometimes acting in harmony with the fore legs, sometimes not, or each leg would move independently without regard either to the fore legs or to the corresponding member on the opposite side.

In a number of frogs the sensory roots of the nerves supplying the hind legs were cut through. When only one side is operated upon, the frog is usually ready to spring away immediately after the operation, the only difference being a slight tendency of the foot and lower part of the leg to cling to the thigh. If the legs do not assume the right position at once after the spring, they usually do in a short time. When both sides are operated upon, the effects are more pronounced and of a different nature, showing that the movements of one extremity are affected by the movements of its mate on the opposite side; that the sensibility and motility of one foot induces equally strong reactions in the opposite member.

This influence which the mobility and sensibility of one side exerts on the other has its parallel in human pathology, as shown in cases of one-sided paresis, when one limb can be moved only when similar motions are made at the same time by the other.

The writer finds three sources of control for every member. Parts of the brain, the sensibility of the extremity itself, and sympathetic influence exerted by the sensibility and motility of the corresponding organ opposite. The regulation through sensibility is relatively strongest.

#### THE WHITE ELEPHANT.

"THE Glory and Decadence of the White Elephant" is the title of an article by M. Henry de Varigny in the *Bibliothèque Universelle*, from which may be gleaned some curious details as to this favored one among his kind.

The white elephant, as is not perhaps universally known, is not white at all,—only of lighter hue than his fellows, his hide being light or reddish gray. A perfect specimen should have pink eyes with yellow iris, hide of a light brownish red, and the interior of his ears and trunk, as well as his nails, should be white, and his hair red. But Europeans are unjust in attributing the epithet "white" to Oriental exaggeration, as the error is that of translators having an imperfect knowledge of the fine points of Eastern vernaculars. "The truth is," says Pyana, in a recent article in the *Imperial and Asiatic Quarterly Review*, "that the term of white elephant does not exactly translate the Siamese or Burmese word which indicates the color of the animal. In Burmese, for instance, they say *sin pyu*, *sin* meaning elephant. But *pyu*, although meaning white, has also other acceptations,—such as gray, light, less dark. It is used to characterize the lighter complexion of a native woman less dusky than her countrywomen without being even remotely to be confounded with a Caucasian. Besides, the Burmese often use the expression *sin nee*, meaning red elephant. In Siamese the animal is called *chang pueuk*, *chang* being equivalent to elephant. *Pueuk*, which formerly meant white or light, is now only used in the sense of albino. Thus we see that the native expressions are erroneously translated by white elephant; the correct term would be light elephant."

#### THE WHITE ELEPHANT IN MYTHOLOGY.

According to the Buddhist legend, before assuming the human form of Gautama, the founder of Buddhism, Buddha lived in the form of a white elephant; so, in all probability the prestige of the white elephant dated much further back than Buddhism, else he would not have been chosen as the precursor of Gautama. Indeed, the elephant had his place in the Indian pantheon since the most remote periods. Indra was always represented as mounted on an elephant, who shared

in his divinity; and in the ancient worship of the sun, the white elephant and the white horse were considered emblems of the sun himself. Inspired, doubtless, by reminiscences of the solar myth, there is a Vedic tradition that at certain long-separated periods in the existence of the world, a universal monarch makes his appearance on earth. He is of celestial origin, and the initiated recognize him by varied and numerous signs. For the feet alone there are thirty-two signs. Besides physical signs, this miraculous personage possesses seven particularly precious accessories, and the chief of these is a white elephant. Without the white elephant, all claims lack authenticity. Hence it is easily understood why the different kings of the Indo-Chinese region and of the Buddhist countries,—each deeming himself the only authentic descendant of the ancient Vedic kings, all cherishing the hope of becoming the legendary universal monarch,—consider the white elephant an indispensable possession, and have done and do all in their power to procure him, by hook or by crook,—by crook preferably, because it is the surer way.

But the true country of the white elephant is Indo-China. There his prestige has been longest maintained. There the proudest orders of knighthood bear his image on their regalia; there he still majestically represents the national antiquity and glory on the royal banner. The travelers who visited Siam and the neighboring regions in the sixteenth century bear witness to this veneration in many passages. When the Trojans were fighting because of a woman, many Orientals waged war to gain a white elephant, and even about 1650 there was continual strife between the Siamese and the king of Pegu because of seven white elephants the latter coveted.

#### HONORED IN HIS OWN COUNTRY.

Only twenty-five years ago the lot of the white elephant in Siam was an extremely enviable one. A party of hunters discovered a very good specimen. The news spread, and the whole country went wild with delight. The king immediately dispatched an escort of great personages, whose duty it was to mount guard around the animal, which was tied by silken ropes in the forest where he was found. For, like his ordinary brethren, the white elephant has to undergo a course of taming and domestication before he is brought to the capital. Professionals instructed him in etiquette, and the great personages served as guard of honor. Meanwhile, people flocked from all directions to see him, bringing presents and invoking for him the divine protection. He was then conducted in royal pomp to Ayuthia, special roads having been built from the place of

his discovery to the nearest highway, and a sort of floating house of rare wood, drawn by pontoons, lined with silk, adorned with banners, and surrounded by a flotilla of gilded barks, was furnished to convey him across the river. The king, with the court, met the cavalcade here, and kneeling before the elephant made appropriate offerings. The priests then read a very long address of welcome, ending thus: "It is due to your own merit that you have at last come to see this beautiful city, to enjoy its riches and to become the favored guest of His Most Serene Majesty the King." Then the Brahmins baptized him with holy water, and bestowed on him the highest title the king could confer.

This title was written on a piece of sugar cane, together with a number of phrases enumerating the qualities, virtues, and perfections of the new lord, and the sugar cane was extended to His Highness, who swallowed it on the spot, thus indicating that he accepted the honors granted him. Then the procession advanced to Bangkok, all illuminated and decorated in honor of the event. Here awaited him a palace second in splendor only to the king's; an elaborate wardrobe,—velvet and silk coverings embroidered in gold and jewels,—ornaments and marvelous trappings, with a gold plaque to be suspended on his forehead (on which was inscribed his patent of nobility); a prime minister, a retinue of slaves, a choir of priests, an orchestra of musicians, and—*a corps de ballet!* To maintain this establishment a whole district was granted him, all the revenues of which were paid into his treasury. Thus amply provided for, His Elephantine Highness led a life so indolent that he soon succumbed to the too great kindness lavished upon him. Then a royal funeral was given him, and the search for a successor was begun.

#### DEATH IN FOLK-LORE.

ONE of the most interesting articles in the *Revue de Paris* is that by M. Le Braz, dealing with what may be called the folk-lore view of death. From time immemorial, he points out, the Celtic race have believed in a future life, and have made themselves familiar with the thought of death. In southern Europe the inevitable approach of the great Destroyer has ever been regarded with intense horror and fear. The Romans,—who were, of course, southern,—were amazed at the calmness with which the northern races conquered by them regarded death. The Gauls had among their divinities one who was styled the God of Death, and many of them believed that from him all mankind was descended. The Celtic ancients believed that the country of

the dead lay beyond the seas, and was in fact a real country or tract of land.

Occasionally, in the oldest folk-lore of Brittany, historians come across traces of this idea, for it not unfrequently happened that a bereaved widow would set sail on the sea in the firm hope that she would reach the "other side." Of ghosts, or returning spirits (those that come back, as they are styled in France), the Celtic people seem to have had no thought at all till about the tenth century; but during the last thousand years spirits have played a considerable rôle in Celtic literature, and both in Ireland and in Brittany is constant reference made to the banshee, who foretells disaster by her presence.

Brittany has remained curiously mediæval, and in nothing more so than in her somewhat morbid interest in death. Even now in many a Breton village the parish church is not known as the House of God, but as the "House of the Dead;" and till quite recently there was a place put apart for the reception of the bones of the departed. Not unfrequently, in addition to the ordinary village fane, a second chapel, entirely given up to the cult of the dead, claimed each Sunday the suffrages of the villagers. Many of these remain, and are extremely beautiful, notably the Campo Santo of St. Pol de Leon. Inscriptions,—some curious, some pathetic, some strangely pagan,—are to be found running round these mortuary chapels. Many are in Latin, others in French, and even more in Celtic. A favorite motto is that addressed to the still living passer-by: "Oh! sinner, repent while there is still time, for one day you will also be here." Yet another favorite dictum is a Celtic verse of which the sense, roughly speaking, may be rendered: "Death, judgment and hell; when mankind thinks on these things it should tremble. He who does not think of death is surely lacking in mind." Once a year, on the eve of All Saints' Day, processions take place all over Brittany, each wending its way to one of these mortuary chapels.

Of late years there has been an attempt made on the part of the municipal authorities to build these mortuary chapels at some distance from the villages. This appears like profanation to the pious Bretons, whose ideal mortuary would always be placed in the very middle of the village, with the houses grouped round. It is thought to be unlucky if an infant on its way to be christened does not go through a burial ground, and the cemetery is the chosen meeting-place for lovers. There is something profoundly touching about a Breton churchyard; the graves are beautifully kept and covered with quaint offerings.

## THE PERIODICALS REVIEWED.

### THE CENTURY MAGAZINE.

THE opening article of the August *Century* is "The New New York," Mr. Randall Blackshaw's account of what is being done to make a great city on Manhattan Island. The original purchase price of Manhattan Island was about \$24. To-day building sites have brought more than \$240 a square foot, and the assessed valuation of real estate in Greater New York is to-day about \$3,250,000,000. Mr. Blackshaw thinks that of all great works now in course of construction on Manhattan, the most significant are the projected railway tunnels, with the East River bridges taking second place. Next to these comes the erection of such magnificent buildings as the Episcopal cathedral, the public library, the proposed post office and the custom house, the chamber of commerce and the stock exchange. Mr. Blackshaw thinks that the proposed tri-centennial celebration of the discovery of the Hudson River will find us in 1909 with a city three centuries old that we can be proud of.

### THE KING OF AMERICAN SHOWMEN.

There is an excellent sketch of the late "P. T. Barnum, Showman and Humorist," by Joel Benton. Mr. Benton writes of Barnum as the gigantic dispenser of amusement. Mr. Barnum's home was at Bridgeport, Conn., and he was fond of putting something in the buildings and fields that suggested a show. On one occasion he had an elephant engaged in plowing on a sloping hill where it could plainly be seen by passengers of the New York, New Haven & Hartford Railroad. This sight was so widely described and discussed that the showman received letters from farmers all over the United States, asking him how much hay an elephant ate, and if it were more profitable to plough with an elephant than with horses or oxen. Mr. Barnum invariably answered: "If you have a large museum in New York, and a great railway sends trains full of passengers within eyeshot of the performance, it will pay, and pay well; but if you have no such institution, then horses or oxen will prove more economical." At Mr. Barnum's house the governor of Connecticut could be often seen, unbending himself; Horace Greeley was a not infrequent visitor, "Mark Twain" and Elias Howe often dropped in; and Matthew Arnold, when he came to America, was the guest of the showman.

### THE WEST INDIAN VOLCANIC DISTASTERS.

Prof. James F. Kemp, of Columbia University, writes on "Earthquakes and Volcanoes." There is a graphic record of the Martinique disaster in a letter written by the vicar-general of the island in the form of a journal from May 2 to May 21, and the life in the doomed city is shown by translations from the leading newspaper of St. Pierre, *Les Colonies*, in its editions of May 1 to 7, the week previous to the disaster. *The Century* pays attention, too, to St. Vincent's catastrophe, by printing the observations and narratives of two eye-witnesses, Captain Calder, chief of police of St. Vincent, and T. McG. McDonald, owner of the Richmond Vale estate on the island.

### HARPER'S MAGAZINE.

THE August *Harper's* contains an article on "The Lineage of the Classics," by Dr. F. G. Kenyon, who tells how the works of the great authors of the ancient world, of Homer and Thucydides, of Virgil and Livy, have been preserved, and illustrates his explanation by reproductions from manuscripts in the British Museum. Of the classics proper we have no original autographs, nor any copies nearly contemporaneous with them. The plays of Æschylus were written between 485 and 450 B.C., for instance, and the earliest extant manuscript of them, a few unimportant scraps excepted, was written in the eleventh century, an interval of some 1,500 years. For Sophocles, for Thucydides, for Herodotus, the interval is substantially the same, and for Pindar and Euripides it extends to 1,600 years. Thus the destruction of manuscripts of the classics has been enormous owing to the fragility of the papyrus on which the original matter was written. Then the rolls of manuscript might be thirty feet long, which rendered them unwieldy and more liable to destruction. Many great authors have totally perished, and some of the great works of the classics we do know have been finally lost.

Prof. Robert K. Duncan writes on "Radio-Activity, A New Property of Matter." The cathode rays and the X-rays arise from a Crookes tube, a mechanism which is the complicated result of centuries of thought; they are a property of condition. The Becquerel rays, discovered by Henri Becquerel, a member of the French Institute, come from radium, a substance dug from the ground, which emits them, apparently, forever and forever, as it has emitted them through the countless centuries of the past, without any extrinsic influence. It is their natural intrinsic property—a new property of matter—radio-activity. The radium rays possess the X-ray properties of penetrating matter generally considered opaque. Aluminum is transparent to the rays, whose power is influenced only by the density of the substance interposed. Lead is comparatively opaque. The physiological effect of Becquerel rays is curious. A pinch of radium salt contained in a sealed glass tube was placed in a cardboard box, which was then tied to the sleeve of a professor for an hour and a half. An intense inflammation resulted, followed by a suppurating sore which took more than three months to heal. Mr. Duncan says that considering, then, the cost of the pitch-blende from which it is extracted, the value of radium would be at least \$10,000 a gramme. As a matter of fact, less than a gramme exists to-day.

Mr. Charles Hallock writes on "The Primeval North American" and the civilization which flourished in North America about ten thousand years ago. The Korean immigration of the year 544, which led to the founding of the Mexican empire in 1325, was but an incidental contribution to the growing population of North America. Mr. Henry W. Oldys contributes a very suggestive essay on "Parallel Growth of Bird and Human Music," and there is a plentiful supply of imaginative material embellished with pictures in colors.

his discovery to the nearest highway, and a sort of floating house of rare wood, drawn by pontoons, lined with silk, adorned with banners, and surrounded by a flotilla of gilded barks, was furnished to convey him across the river. The king, with the court, met the cavalcade here, and kneeling before the elephant made appropriate offerings. Oldys contributes a very suggestive essay on "Parallel Growth of Bird and Human Music," and there is a plentiful supply of imaginative material embellished with pictures in colors.

## SCRIBNER'S MAGAZINE.

THE August *Scribner's* begins with a new short story by Rudyard Kipling, "Wireless," and the only break in this fiction number is Edith Wharton's Italian travel sketch, "A Midsummer Week's Dream." Mr. A. T. Quiller-Couch's story is impressively illustrated with colored reproductions of Howard Pyle's drawings; there is the beginning of a new serial by J. M. Barrie, "The Little White Bird;" and a number of other capital contributions of fiction go to make up a notable story number.

## M'CLURE'S MAGAZINE.

THE August *McClure's* contains a sketch of John Mitchell, the labor leader, by Mr. Lincoln Steffens, and a study of "Mont Pelée In Its Might," by Prof. Angelo Heilprin, from both of which we have quoted in another department.

Miss Stone's account of her experience among the brigands is followed this month by Mrs. Tsilka's story of the little baby that was born while that lady was sharing Miss Stone's captivity.

M. Santos-Dumont contributes an autobiographical sketch under the title, "How I Became an Aeronaut." The balloonist is only twenty-nine years old. He was born in Brazil. He says he was an aeronaut by nature, and his playmates used to tease him about his propensity to flying kites when he was a little boy. He has, in fact, evidently been studying the principles of human flight his whole life. M. Santos-Dumont has decided in favor of a petroleum motor, and the fundamental principle of his experiments has been the effort to minimize weight. Early in his experiments he constructed a  $3\frac{1}{2}$  horse-power motor weighing only 66 pounds, a very remarkable engine at that time.

The balance of the August number is composed of fiction, including a daring but delicious little idyl by Stewart Edward White, "The Life of the Winds of Heaven."

## THE COSMOPOLITAN.

IN the August *Cosmopolitan*, E. A. Bennett has a sketch of H. G. Wells and his work. "Anticipations" is not the work of a Jules Verne, this writer explains. "The great difference between Jules Verne and Mr. Wells is that the latter was trained in scientific methods of thought, while the former was not. Before Jules Verne took to romances he wrote operatic libretti; before Mr. Wells took to romances he was a pupil of Huxley's at the Royal College of Science. He graduated at London University with first-class honors in science, and his first literary production was a textbook of biology."

The *Cosmopolitan* continues its sketches of "Captains of Industry," with articles on William Rockefeller, Charles T. Yerkes, H. M. Flagler, W. C. Whitney, and A. J. Cassatt, president of the Pennsylvania Railroad. Of William Rockefeller, Mr. S. E. Moffett says he is noted among U. S. associates and subordinates for his perfect mastery of all the details of the operation of the company, his clear and sound judgment, and his keen critical faculty. "He is not a physical weakling, like his formidable brother. The steam that drives his mental machinery comes from a capacious material boiler. His physique is of the robust, J. Pierpont Morgan type. He is an enthusiastic horseman, and a lover of the fields and woods. But, like all the Rockefellers, he is devoutly religious. He has only one vice,—he

plays the violin. Aside from that, he is exemplary in his private relations."

Mr. Charles S. Gleed gives Mr. Cassatt, the president of the great Pennsylvania system, credit for a wonderful faculty of selecting the important thing, and of leaving the next most important for another time or another man. Mr. Cassatt was highly educated, and then went through a rough-and-tumble experience as a surveyor's rodman on the Pennsylvania road.

Mr. Rafford Pyke, in an essay on "What Men Like in Men," places the quality of "squareness" first, then reasonableness, then courage, generosity, modesty, dignity, and tenderness, in the order named. There are articles on "London Society," "Diversions of Some Millionaires," "The Organization of a Modern Circus," "City Ownership of Seaside Parks," and the love story of Heine and Mathilde.

## MUNSEY'S MAGAZINE.

IN the August *Munsey's*, Donald Mackay, writing on "The Cow Puncher at Home," tells something of the life of the cowboy, who is, he says, practically the same to-day as in the early development of the West and Southwest. Cowboys are Americans generally, and sometimes English; "no man has ever seen a German cowboy, or a French." The cow puncher gets \$30 to \$75 a month, and saves it up for a considerable time, until he gets to the city, where it does not take long to separate himself from it. In the round-up each outfit consists of a cook wagon, a cook, two horse hustlers, and eight riders. Every 5,000 head of cattle requires such an outfit. Each rider possesses eight horses, three of which he uses every day. The cowboy country extends over the great prairies of Texas, Oklahoma, and New Mexico, and thence northward to Wyoming and Dakota. Mr. Mackay says that in Texas women have taken to ranching, and that one of the most successful, Mrs. Pauline Whitman, owns a ranch of 300,000 acres in the Pan Handle. She raises 15,000 cattle annually, and requires twenty cowboys for their handling.

Mr. Oscar K. Davis, formerly the New York *Sun's* correspondent in the Philippines, contributes an article on "The Moros in Peace and War," which is timely in view of the recent peacemaking with the Moro people. Mr. Davis says the Moros are the most formidable of the native tribes in the Philippines, and a campaign against them must be a serious affair. The center of Moro population in Mindanao is about Lake Lanao, in a fine upland country, where the natives cultivate great fields of rice and sweet potatoes. The Spaniards fought their way to this lake from the north coast in the face of tremendous resistance. They opened a road, which they protected with numerous blockhouses, and up which they lugged three small gunboats built in sections. The boats were put together at the lake and launched, but never saw much service, and were finally scuttled. Mr. Davis says the Moro fighters are very different from the Filipinos. Although they are poorly armed, they use with deadly skill and energy terrible knives which they make themselves, and with which they can easily cut a man's head from his shoulders by one blow.

There are other articles in this number of *Munsey's* on "Country Life in England," by Lady Colin Campbell; the Stony Wold sanatorium for consumptives being established in the Adirondacks; "The New Photography," by Charles H. Caffin; and "College Girls' Dramatics," by Alice K. Fallows.

## THE WORLD'S WORK.

IN the August *World's Work* there is an article by Ray Stannard Baker telling how labor is organized in America, which we have quoted from in another department. The August number of this magazine is taken up largely with sixty or seventy pages of pictures and text descriptive of recreation grounds of the American people. To show what important financial terms the recreation of to-day is sometimes expressed in, the writer of the sketch "Across the Canadian Border" says that Mr. J. J. Hill pays for the privilege of fishing in the St. John River \$3,000 a year, with \$500 more for the St. Paul. Mr. H. W. deForest has leased for himself and his associates the fishing in the Grand Cascadepia for \$7,500 a year; Mr. I. W. Adams, of Boston, has paid \$30,000 outright for the privilege of fishing in the Moisie, and half as much more for another stream; Mr. Lewis Cabot refuses \$50,000 for his salmon-fishing rights in the Gaspé. The Restigouche Salmon Club, composed entirely of Americans, is so much sought for that its membership shares are worth from \$7,500 to \$10,000 each.

Mr. Frederick Palmer writes of "West Point After a Century;" O. P. Austin asks the question, "Will Our Commercial Expansion Continue?" and gives his opinion in the affirmative; and Mr. Russell Doubleday describes, in "New York to Chicago,—20 Hours," a trip on the new trains of the Pennsylvania and New York Central, that make the fastest long run in the world,—enabling a man from one city to do business in the other and be gone only one day.

## COUNTRY LIFE.

IN *Country Life* for August there is an article on "The Automobile," with some instructions for beginners. This writer does not attempt to award the palm to one or the other of the different types of automobiles in use now,—electric, gasoline, or steam. He calls attention to the fact that whereas the gasoline machine is very convenient and practical, and is easy to start, and can run for a long distance,—one or two hundred miles, on one filling of gasoline and water,—on the other hand, steam vehicles have remarkable hill-climbing power, and give an extraordinarily delicate control of the carriages and their speed. They run quietly, too, without vibration. But the steam vehicles must be replenished with water about every twenty-five or forty miles. As to prices, this writer does not seem to think there will be any radical lowering of prices in the near future. Steam and gasoline automobiles may now be purchased as low as \$600 or \$700. Well-built machinery is expensive; cheap and flimsy machinery is out of question on an automobile. He reminds us that the price of bicycles would show that automobiles are rather cheap, for a bicycle in its best form is built today for about two dollars a pound, whereas an automobile costs only about one dollar a pound. He advises beginners to buy second-hand machines and paint them up.

Mr. Clarence A. Martin writes in the series on "The Making of a Country Home," and gives some general advice as to "The Main Features of the House." William L. Underwood tells how to make a water garden and how to keep it free from mosquitoes. T. W. Burgess describes the wonderful country home of Mr. E. C. Benedict at Greenwich, Conn., which is one of the favorite haunts of Ex-President Grover Cleveland. W.

C. Egan gives good practical directions "How to Make a Garden," and there are various pleasant suggestions for vacation-seekers and nature students at home.

## FRANK LESLIE'S MONTHLY.

IN the August *Frank Leslie's* there is a description of "The Birds of Farthest South," by C. E. Borchgrevink, the explorer and discoverer of the Antarctic Continent. The penguins are the most characteristic birds within the South Polar circle, and these are found in great numbers on land and on sea. The legs are placed so far back on the penguin that when the bird is walking it stands upright, and the wings are so rudimentary that they are more like flippers. When they wish to leave the water, they put on a great spurt of swimming speed, and then, with a mighty flapping of their wings, they rise two or three yards in the air. Mr. Borchgrevink shows some remarkable photographs of the populous penguin colonies of the Antarctic Continent, and some curious incidents in the birds' life. Their great enemy is the skua gull, which hangs around the desert islands, trying to steal the eggs and young ones. The penguins live on the edge of the ice-pack in winter time, and live off of fish and crustaceans, the flesh being so unutterably oily that a human being cannot stand it.

There is a brief sketch of Otis Skinner, the actor, by Franklin E. Fyles, who calls his subject the best elocutionist on the American stage, with the exception of Mrs. Le Moine. The remainder of this number is devoted to fiction.

## EVERYBODY'S MAGAZINE.

THE August number of *Everybody's Magazine* contains a description of the sheep-dog trials in the north of England, by A. R. Dugmore, which we have quoted from in another department. The magazine begins with a harvesting idyl in prose by Martha McCulloch Williams, whose recent volume of nature studies, "Next to the Ground," has been so handsomely received.

Arthur E. Johnson tells of a welcome invention by the chief of the United States Weather Bureau, "A Summer-Time Stove." This curious contrivance turns in an instant air of the temperature of a hundred degrees to a temperature below freezing point, and Mr. Johnson thinks it promises to become a factor of no mean importance in furnishing not only comfort to humanity in general, but aid to the manufacturing world, where room temperature is an item in the protection of goods. Professor Moore calls the novel refrigerator a gravity cooler. In outward appearance it is a plain round cylinder, connected with the outside air by a pipe of generous diameter, and having a similar pipe extending from beneath. Mr. Johnson's account of the scientific principles involved is not very elaborate or convincing. "Place your hand in front of the discharge pipe near the floor and you can feel ice-cold air coming forth in a strong draught. An anemometer, a machine for measuring air, placed in front of this pipe announces that air is coming out at the rate of 200 cubic feet a minute, or 12,000 feet an hour. Turn a damper in the pipe which leads to the outer air, and the wheels of the anemometer immediately cease turning. This seems to prove that the air enters the machine from the top and goes through it of its own sheer weight, being made heavier as it is cooled."

Holman F. Day describes "The Day's Work of a New England Farmer," there is a dramatic story by Frank Norris, "A Deal in Wheat," and other summery contributions.

#### THE ATLANTIC MONTHLY.

FROM the August *Atlantic Monthly* we have selected the excellent travel sketch describing Pygmy life in Central Africa, by Mr. Samuel Phillips Verner, to quote from among the "Leading Articles of the Month."

An appreciation of Bret Harte by H. C. Merwin places that author very high among the literary artists America has produced. Mr. Merwin thinks Bret Harte would still have been a genius and great writer if gold had never been discovered in California. Mr. Merwin says that Bret Harte at his best had in the choice of words, the balance of his sentences, and the rhythm of his paragraphs, a very nearly perfect style. He was essentially an artist with the artistic incapacity to deal with abstract notions or general propositions. Mr. Merwin thinks that Hawthorne himself could not have conceived a purer character, or have told the story more delicately, than Bret Harte in "The Idyl of Red Gulch." The deficiency in Bret Harte's work was a certain limitation of creative power, which prevented Bret Harte, as it prevented Kipling, from writing a successful novel. Mr. Merwin thinks Bret Harte's one sustained effort, "Gabriel Conroy," is a nightmare.

In discussing "The Revival of Poetic Drama," Mr. Edmund Gosse thinks it is safe to say that since the days of Shakespeare we have not before seen an occasion upon which two dramatic poems of real and high literary merit, by the same author, have enjoyed runs and success at the same time upon the London stage. Mr. Gosse refers, of course, to the "Ulysses" and "Paola and Francesca" of Mr. Stephen Phillips. Mr. Gosse thinks the reason why poetic drama has always failed in England since the seventeenth century is that it remains faithful to the Elizabethan tradition. Accordingly he places his greatest hope for the newest revival of poetic drama in England in the fact that it is independent of the Elizabethan tradition. While he thinks Mr. Phillips "has been the victim of more injudicious praise than is often poured out upon young writers even in this crude and impetuous age," still he gives him credit for having produced already "one of those revivals of poetic drama which occur in our history three or four times in every century."

This August issue of the *Atlantic* refrains from discussions of heavy and serious topics. There is a vivid description of "The Moonshiners at Home," by Leonidas Hubbard, Jr., and contributions of fiction from Norman Duncan, Bettina von Hutton, Jack London, Arthur Colton, Alice Brown, and a breezy essay, "The Browning Tonic," by Martha B. Dunn.

#### THE FORUM.

IN the first number of the *Forum* as a quarterly review the general character of the magazine is changed, while its former high standards are maintained, but the review and outlook features are more fully developed. In other words, the magazine is turned into what is called in the English and European reviews a "chronique," including not only a record of current events, but in most cases estimates of general tenden-

cies. There are nine departments, each conducted by a specialist, who writes a critical exposition of such events of the last three months as come within his own sphere. In the issue for July-September, Mr. Henry Litchfield West discusses American politics, Mr. A. Maurice Low foreign affairs, Mr. A. D. Noyes finance, Mr. Henry Harrison Supplee applied science, Mr. John Corbin the American drama, Mr. Frank Jewett Mather, Jr., literature, Prof. A. D. F. Hamlin architectural art, Mr. Ossian H. Lang educational events, and Dr. J. M. Rice, the editor of the magazine, educational research.

#### CHINESE EXCLUSION.

The first of the three special articles, so-called, which appear in this number, supplementary to the reviews of events, is on the subject of "Chinese Exclusion," and is signed by the Hon. Charles Denby, our former minister to China. Mr. Denby argues in favor of a continuation of our policy of exclusion; but holds that we should act openly and honorably in the matter, and not under cover of a strained interpretation of words. "We should declare that a certain number of students may come to this country, as well as a certain number of merchants, and a certain number of other classes if desirable, and the remainder should be excluded. Surveillance should be exercised over the persons so admitted in order that they might not become laborers. Our trade relations with China are promising, and they ought not to be disturbed by the enactment of unnecessary and unjust laws. A respectable Chinese merchant engaged in business in China, and desirous of doing business with the United States, should be encouraged to come to this country, and to buy supplies here. If we are to lose our trade with China, one of the main objects of acquiring the Philippines will be defeated."

The second special article in this number is contributed by Mr. Wolf von Schierbrand on "Germany as a World Power," and the third is an appreciation of the late Sir Walter Besant, by Prof. William P. Trent.

#### THE NORTH AMERICAN REVIEW.

IN the opening article of the *North American Review* for July, Thomas A. Edison briefly describes the tests applied to his recently-perfected storage battery for motor cars. Mr. Edison declares that the battery has sustained and overcome the four very thorough tests applied to it, and that there is every prospect of the same result from the fifth and last test. Mr. Edison's own conception of the condition to be met by the storage battery is that it should be a perfectly reversible instrument, "receiving and giving out power like a dynamo motor, without any deterioration of the mechanism of conversion." Mr. Edison describes the run made by an automobile supplied with power from his storage battery in which a distance of sixty-two miles over country roads containing many grades, some as steep as twelve feet in a hundred, was covered by the vehicle, making at the end of the run 83 per cent. of the original speed, the average speed over the entire distance being 11 2-100 miles per hour. On a comparatively level country road, a little heavy from a recent rain, the same vehicle on one charge came to a stop at the eighty-fifth mile. Mr. Edison expresses the opinion that the automobile, aided by the new battery, will ultimately come within the reach of the man of moderate means. "With an initial outlay of \$700 and up-

ward, the storage battery automobile can be used once a week at the cost of a fifty-cent charge, or twice for a dollar, and so on, the cost of use being met as it is incurred and so ceasing to be the bugbear that fixed charges must always be to the householder of moderate income." The fifth endurance test of the battery, the results of which have not yet been published, is the running of five different models of automobiles of various weights and construction over five thousand miles of country road at an average distance of one hundred miles per day.

#### AMERICAN SHIPBUILDING AND THE SHIPPING TRUST.

The inter-relation of two great recent developments in the industrial world,—the forming of the Atlantic steamship merger and the organization of the American shipbuilding trust,—is suggested in an article contributed to this number of the *Review* by Mr. Charles H. Cramp, of the famous firm of shipbuilders. Mr. Cramp expresses the belief that the direct influence of the Morgan steamship trust will be in the direction of stimulating American shipbuilding. He shows that the agreement with the Belfast shipyard of Harland & Wolff will by no means prevent the management of the trust from building some of their ships in the United States, but he hints at certain desired legislation on the part of our government to enable any American to build and operate ships under the American flag as favorably as under foreign flags.

#### THE GERMAN EMPEROR'S PERSONAL INFLUENCE.

Mr. Wolf von Schierbrand makes a rather savage attack upon Emperor William II., the autocrat of modern Germany. He asserts that the Kaiser's influence has been wonderful, not only in public life, "lowering the national standard of political thought and liberty," but also in German literary and art life. This writer condemns him especially for his war upon what is known as the "Secessionist" or "Realistic" movement in literature, represented by Hauptmann and Sudermann, and a corresponding movement in German art represented by Böcklin, Liebermann, Klinger, and others. The greatest injury, however, according to this writer, has resulted from the Kaiser's attempt to curb the freedom of the press and of periodical literature. "The practice of the courts all over Germany, from the lowest to the highest, has been, since the accession of William II., growingly and steadily illiberal and systematically inimical to the press. Honest expression of opinion, whenever it contravened the Kaiser's ideas and convictions, has been so severely and persistently punished that it may be said to be effectually muzzled."

#### OTHER ARTICLES.

Karl Blind writes on "The Prorogued Turkish Parliament;" Commissioner-General T. V. Powderly on "Immigration's Menace to the National Health;" Mr. M. W. Hazeltine on "Mr. Carnegie's New Book;" Mr. Vernon Lee on "The Economic Dependence of Women;" H. Cust, M.P., on "Cecil Rhodes;" Auditor H. A. Castle on "Defects and Abuses in Our Postal System;" and Dr. Adolph Wagner on "The Public Debt of Prussia." Prof. Lewis M. Haupt, formerly a member of the Nicaragua Canal Commission, sets forth the advantages of Nicaragua as contrasted with the Panama route for a canal. Mr. John Handiboe's article on "Strikes and the Public Welfare" is reviewed in another department.

#### THE ARENA.

THE July number of the *Arena* opens with a symposium on "Why I am Opposed to Imperialism," by President George McA. Miller, Prof. Thomas E. Will, Mr. Bolton Hall, and Mr. Ernest Crosby. Among the reasons stated by these gentlemen for their opposition to the present policy of the United States Government are that it is an abandonment of a high national ideal; that it is a breaking of national faith; that it is an introduction of despotism; that it is a policy proved by history to be a failure; that it is based upon physical force; that it is founded on a false pride of race; that it is "steeped in cant and hypocrisy," and that it distracts our attention and our material resources from home problems.

#### WHY THE PACIFIC COAST FAVORS NICARAGUA.

Mr. Edward Berwick explains why the Pacific coast producer has all along favored the Nicaragua route for the canal as opposed to the Panama, even to the point of declaring for "Nicaragua or nothing." The wheat grower of California wishes to be put on an equal footing with his rival in the Argentine Republic, and prefers the Nicaragua route because of its availability for sailing vessels. Farmers' most perishable products, on the other hand, will suffer less from detention in tropical heat and damp by the Nicaragua route than by the Panama, while for all purposes of interstate commerce the nearness of Nicaragua commends it as the more desirable route.

#### THE ACTORS' CHURCH ALLIANCE.

Dr. George Wolf Shinn gives an account of the formation and objects of the Actors' Church Alliance, which has now established itself in four hundred cities in the United States and Canada, and counts a membership of over two thousand. The objects of this organization are to promote the best interests of the stage and the Church by seeking to produce on the part of each a just appreciation of the opportunities and responsibilities of the other, and to endeavor to unite the stage, the Church, and the general public in a mutual effort for the betterment of all. The Boston chapter has had receptions in theaters, lectures, essays, and discussions in halls, and smaller gatherings here and there. It has successfully carried through a benefit performance and a bazaar to raise funds, and has had a religious service once each month in some church, to which actors and their friends were especially invited. Both the Boston and New York chapters now possess headquarters of their own, and are engaging in active work.

#### OTHER ARTICLES.

Mr. William H. Morrell writes on "Evolution and Optimistic Politics," Mr. Adam Rosenberg on "Socialism in Ancient Israel," Mr. Marvin Dana on "The Pride of Life," Mr. William Leighton on "Whitman's Note of Democracy," and Mr. Eltweed Pomeroy on "The Present Political Outlook."

#### GUNTON'S MAGAZINE.

IN the July number of *Gunton's* the editor attempts to make clear the real issue in the present coal-strike discussion in the following paragraphs:

"Whether the demand for an eight-hour day and an increase of 20 per cent. in wages is reasonable or unrea-

sonable really cuts no figure in this strike problem. If the employers had consented to the conference with the unions, it is altogether probable that the demands of the men might and would have been modified down to a thoroughly reasonable and economic basis. After the reply of the corporations, there was nothing for the laborers to do but accept the decision that they would not be permitted to participate in making the contract under which they would have to work or strike.

"In this state of facts, as developed by Commissioner of Labor Wright's investigation, it is clear that the corporations are responsible for the strike. All the inconvenience to the public is chargeable to the railroad managers, because their attitude left no other alternative for the men except unconditional surrender of all voice in determining their conditions."

#### FACTS ABOUT SOUTHERN CHILD LABOR.

Mr. Hayes Robbins, in a paper on "The New South's Rare Opportunity," estimates the number of children under fourteen years of age at work in the cotton mills of North and South Carolina, Georgia, Alabama, and Mississippi at 23,000. Eight or ten thousand of these children are believed to be under twelve, while the fact is well established that some children of nine, eight, and even six years are at work in Southern mills. In connection with these facts, we are reminded that fourteen years is nearly the average age under which factory labor is prohibited by the laws of most of our Northern States and of European countries where there has been any legislation on the subject.

#### THE NINETEENTH CENTURY.

IN the *Nineteenth Century* for July, Sir Robert Anderson, writing on London "Hooliganism," maintains that magistrates should be empowered to deal with any lad between sixteen and twenty-one who habitually frequents the streets and highways and has no visible means of subsistence. By dealing with them he means that they should be sent to training ships. The most interesting thing in his paper is the statement which he makes as to the estimate of some American friends of his as to the number of murders which they expected would take place every year in London. After much discussion, they fixed an average of about 200. In reality, the average number is about 18.

#### BRITISH AND AMERICAN SHIPPING.

Mr. Benjamin Taylor writes a somewhat cheerful article upon this subject, maintaining that if British shipowners, shipbuilders, and railway companies wake up and brace themselves for the struggle, they have nothing to fear. He would pass a simple resolution through the House of Commons forbidding the sale or transfer by any firm of vessels which it is desirable to keep on the British register for possible use in war, and pass a short act re-imposing the old navigation laws, which would close the British register and coasting trade to foreign-built vessels. He also suggests that countervailing subsidies should be paid, and in other ways he would abandon the theory that the British shipowner is the natural enemy of mankind.

#### THE DEMAND FOR A WHITE AUSTRALIA.

The government resident on Thursday Island, the pearl-fishing station in the north of Australia, gives

some interesting particulars as to the influence likely to be exerted by Asia on Australia. He admits that the pearl-fields could not be worked without Asiatics, but at the same time he is a passionate advocate of a white Australia. This, he says, is the opinion not of the labor party alone, but it is the determination of nine-tenths of the present people of Australia. The southern Australian states will never consent, come what may, to the systematic introduction of colored labor into northern Australia.

#### UNEDUCATED BRITISH OFFICERS.

Maj.-Gen. Frank Russell declares that he thinks the great war now brought to a close will be noted in history as having brought about an entire revolution in the education and training of the officers of the British army. The report of the committee is a startling and a remarkable document. He examines its recommendations in detail, approving of them in the main, and concludes his paper by calling attention to the striking phenomenon that, although the committee examined no fewer than seventy-two witnesses, some of them more than once and many of them at great length, they never asked Lord Wolseley to attend and give them the benefit of his advice and unrivaled experience. The unaccountable omission detracts very much from the value of the report as a whole.

#### PROPHECIES OF DISRAELI.

Mr. Walter Sichel claims that no one ever showed greater prescience as to the future of Great Britain than Disraeli. He quotes many passages from his speeches in proof of this; among others, as far back as 1856 he pointed out that American expansion, so far from being injurious to England, contributed to the wealth of England more than it increased the power of the United States. In 1872, he made the following statement as to the conditions upon which, in his opinion, self-government should have been conceded to the colonies. The passage is a remarkable one, and well worth quoting:

"It ought to have been accompanied by an *imperial tariff*, by securities for the people of England for the enjoyment of the unappropriated lands which belonged to the sovereign as their trustee, and by a military code which should have precisely defined the means and the responsibilities by which the colonies should be defended, and by which, if necessary, this country should call for aid from the colonies themselves. It ought further to have been accompanied by the institution of some representative council in the metropolis, which would have brought the colonies into constant and continuous relations with the home government."

#### OTHER ARTICLES.

Mr. W. H. Ford comes to the rescue of the censor of plays, and maintains that one scene at least in "*Monna Vanna*" is quite inadmissible on the English stage. The late Chief Justice of Hyderabad writes on "*The Islamic Libraries*," and Mrs. Aria discourses on the practice of going to the play in order to display your dresses and meet your friends. Miss G. E. Troutbeck, in an article entitled "*A Forerunner of St. Francis of Assisi*," revives the almost forgotten memory of Abbot Joachim of Flora, who was born in Calabria in the year 1132.

## THE FORTNIGHTLY REVIEW.

**I**N the *Fortnightly Review*, Mr. Francis Gribble gives a very vivid and picturesque account of Alexandre Dumas. He says:

"One may speak of him, for instance, as a dissolute Sir Walter Scott, a magnified non-natural George Augustus Sala, a literary Baron Grant, a Henri Mürger with a talent for getting on, but the analogies do not help one very far. Dumas was all these things, but he was a good many other things as well. His life is a real drama which loses none of its significance through the lapse of time. Here, at least, we have the true story of a Titanic conflict. On the one hand, we have the man of genius proudly defying all the conventional decencies of the social order, and trusting to genius, unsupported by any force of character, to pull him through; on the other hand, we have the patient, untiring social forces biding their time and taking their terrible revenge. The collapse has been compared to the breaking up of an empire; and the story is like the story of Napoleon, transferred to the field of literary and social life."

## MAGERSFONTEIN.

Mr. Perceval Landon tells the story of the defeat of the Highlanders at Magersfontein, putting forward for the first time the unexampled series of mishaps which led to their destruction. The first mishap was the overcharged electricity of the atmosphere, which found expression as soon as the march began in a tremendous thunderstorm which affected the nerves of every man in the force. The brigade, from Wauchope downward, started with a premonition of defeat. When, drenched to the skin, the Black Watch tore themselves through clinging thorns and sinewy branches by main force, a continuous cataract of magazine fire smote them down. When they recoiled, shattered beneath the sudden blow, the quick African dawn rose full upon the scene of failure, enabling the Boers to take aim. At that moment of confusion the brigade found themselves practically without officers, for the new kit in which the officers were dressed rendered them undistinguishable from their men. On this leaderless force lying prone on the veldt the sun arose in a cloudless sky, and the thermometers registered 108 in the shade. A misunderstood operation, ordered by Colonel Hughes-Hallett, was taken as a signal for a general retirement, and the brigade—shaken, broken, decimated—retreated over the coverless zone swept by the Boer fire.

## THE PROSPECT IN TURKEY.

A writer calling himself A. Rustem Bey de Bilinski declares that Abdul Hamid has made his unfortunate empire a veritable hell on earth, and this he has done of resolute purpose, displaying great genius in the systematic efforts in which he has struck poison into every branch of national activity. Believing that prosperity would lead to discontent, he pursues a policy of devastation and desolation. His precautions against assassination are complete. The Young Turks are powerless for some years to come, the Christian races will not rise, and, therefore, as long as Abdul Hamid reigns there is not much prospect that the Eastern Question will be raised. If, however, he were to die, the dogs of war would be unloosed, and a general conflagration might ensue. If his successor adopted a policy of reform and progress, Great Britain might come to the rescue, and the Sultan might make himself the center of a confed-

eration of which his former Christian subjects, now completely enfranchised, would form the outer circle and join hands to resist Europe.

## SCIENCE AND RELIGION.

Mr. W. H. Mallock gives the fourth instalment of his papers on "Science and Religion at the Dawn of the Twentieth Century." This leads him to the following conclusion:

"Science, then, in the principles from which it starts, and in the conclusion to which it leads, is essentially non-religious. It not only fails to support the essential doctrines of religion, but, as is every day becoming more apparent, it excludes them. If, then, we accept, as all reasonable people do accept, the facts which science teaches, are we, as reasonable people, bound to reject religion? I shall show in the next article that we are not, and why we are not."

## THE CONTEMPORARY REVIEW.

**I**N the *Contemporary Review* for July, Mr. J. B. Johnston contributes a very detailed and interesting summary of the evidence against the theory of natural selection. Geological and palaeontological evidence, he says, is every day tending to weaken the Darwinian theory. The earth is now proved to be not so old as was believed, and the enormous periods of time demanded by pure natural selectionists can no longer be granted. Recent discoveries have brought to light many animals in the oldest strata which were quite as highly developed as their posterity in new strata. Mr. Johnston gives a list of such cases, and concludes that while natural selection has played some part in the development of life, it is the part of the eliminator much more than that of the creator. Palaeontology furnishes a vast body of proof that a type appears perfect, or almost perfect, from the first, or at least the type's acme is reached very early in its history.

Colonel Maude writes upon "The Education of Officers." There is a paper by Mr. G. H. Powell on "The Mind of America." Miss Hannah Lynch has one of her brilliantly-worded articles upon "Rebel Catalonia." There is also a paper on the somewhat unprofitable subject of "Immortality" by Emma Marie Caillard.

## THE WESTMINSTER REVIEW.

**T**HE *Westminster Review* for July contains a very instructive paper by Mr. Hubert Reade entitled "Empire as Made in Germany." It was written before peace was signed in South Africa, Mr. Reade's purpose being to show the careful and moderate methods of Bismarck in founding the German Empire as contrasted with the pretences of British imperialists. Bismarck succeeded in roping in the German states into the new empire owing to his moderation and his care to save their *amour propre*. He knew how fatal it would be to Prussia to have subordinate to it a large body of citizens hankering after a vanished past. A tactless statesman would in 1866 have annexed Bohemia, and have filled the palaces of Vienna with kings in exile, making the Prussian flag the emblem of subjection. But Bismarck was extremely moderate; in the art of saving appearances he could have given lessons to the Dowager Empress of China. In the constitution of the German Empire he was equally careful, keeping up the fiction of independence everywhere. The South German states closed the war with France by separate

treaties of peace; the federal states were all to be represented by special envoys at the King's coronation. In short, Bismarck recognized the superiority of diplomacy over edicts in settling international questions, and built up the German Empire with treaties, not with proclamations. If Bismarck had been English prime minister, he would not have refused to treat with President Krüger. He would not have troubled, so long as every Boer was effectively subject to England, to force upon him the recognition of this subjection at every turn. It would have mattered little, while Transvaal and Free State representatives sat in the Federal Parliament of South Africa, whether these states, like the Hanseatic cities, were officially styled republics. He would not have lost a kingdom for the color of an emblem.

Mr. J. G. Godard continues his paper on "Imperialism: Its Spirit and Tendencies." There is an article on the Indian Famine Commission.

#### THE NATIONAL REVIEW.

THE *National Review* for July contains an important article by Mr. Arnold White upon "The Food of the Lower Deck—and a Message from Kiel," which is noticed elsewhere, and a very interesting article, Sir Horace Rumbold's "Recollection of a Diplomatist," full of good stories about such well-known men as Sir Robert Morier, Sir Harry Elliot, Sir Hamilton Seymour, and less great names in the British diplomatic service. Captain Mahan contributes some "Considerations Governing the Disposition of Navies," and Admiral Fremantle discourses upon "Mercantile Cruisers and Commerce Protection." Mr. Whitmore, M. P., writes pleasantly and genially concerning the recently acquired London parks, such as Clissold Park, and Waterloo, Brockwell, and Ravenscourt parks, which are old-fashioned suburban gardens rather than city parks.

Mr. W. J. Courthope makes the following suggestion as to the first step being taken toward imperial federation:

"What would be the objection to having a representative of each colonial government for the time being as a member of a permanent council? The council must necessarily be composed of the executive powers in each part of the empire, but the principle of representation would be duly observed, and it would seem easy to make a body so composed part of the constitution, by converting it into a committee of the privy council. As the council would in itself, to begin with, have neither executive nor legislative functions, there could be no fear of the federal authority attempting to enforce obedience to the central will upon any reluctant member of the voluntary association."

The Earl of Ronaldshay describes a journey taken through Baloochistan and eastern Persia.

#### THE MONTHLY REVIEW.

ONE of the most interesting articles in the *Monthly Review* is Mr. Arthur Morrison's illustrated paper on the "Painters of Japan."

The editor, in his opening paper on "Trade and the New World," recommends the adoption of a policy partly protective and partly aggressive, but he admits that for preliminary work necessary to lay the founda-

tions of his policy it would be futile to look either to the government now in power or to any alternative government at present conceivable. It is, therefore, hardly worth discussing from the point of view of practical politics.

Mr. Worsfold continues his defence of Sir Charles Warren, dealing with the much-disputed question as to who was responsible for the disaster at Spion Kop. Mr. J. H. Rose's paper, entitled "Our Anti-National Party in the Great War," is written from the point of view of a man who thinks that the more completely British foreign policy is examined in the light of contemporary records the better it comes out. He quotes Dr. Gardiner as agreeing with him in this matter, for, said the eminent historian, "It always does; it always does."

Mr. W. B. Yeats contributes an Irish poem which deals with the fate of two lovers, Baile and Aillinn. The Master of Love, wishing them to be happy in his own land among the dead, told to each the story of the other's death, so that their hearts were broken and they died.

There is a curious article entitled "Si Jeunesse Voulait," by Mrs. Hugh Bell, a sermonette to young people on the conduct of life. We have dealt at length elsewhere with Mr. William Archer's plea for national theaters.

#### BLACKWOOD'S MAGAZINE.

"BLACKWOOD'S MAGAZINE" for July contains another instalment of the instructive articles, "On the Heels of De Wet." The writer thinks that whether or not De Wet was the best of the Boer generals, he certainly owed a great deal to good luck. The culpable stupidity of his pursuers often saved him, and even when surrounded by the best leaders and best men, chance has stood by him. Luck, however, generally seemed to have come in the form of what the writer calls "effete British leaders;" and he gives an amusing dialogue to illustrate the stupid timidity with which the British senior officers hampered and interfered with their enterprising subordinates.

There is a very interesting anonymous article on "Celestial Photography," in which the writer points out the uses and drawbacks of photography as used in astronomy. The writer says that even with perfect clockwork, human supervision is necessary in photographing the sky, as owing to changes in the atmosphere the stars change their positions by refraction. As they sink toward the horizon the refraction increases. Photography is not very useful when fine detail is wanted, as on all but two or three nights of the year the star-image dances and quivers in the telescope, and the sensitized plate reproduces its aberrations. Photography is especially valuable in the work of measurement, which the writer insists is a much more important work than mere searching for new celestial objects. One of the great drawbacks of photography is that, owing to the coarseness of the silver particles, the picture will only bear a small magnification—some twenty diameters—after which it begins to show single grains. Also the plate is too faithful, and records everything whether wanted or not. It is in observing faint sources of light that photography is supreme. The Lick telescope, when used in combination with photography, discovered some 120,000 new nebulae, where only 6,000 had been discovered by using the telescope alone.

## THE CONTINENTAL REVIEWS.

## REVUE DES DEUX MONDES.

THE terrible events of 1871 are beginning to be regarded in France as ancient history, and accordingly much is being published which throws a strong light on many events which at the time appeared utterly mysterious and incomprehensible. The place of honor in the first June number of the *Revue des Deux Mondes* is given to an article entitled "The Biarritz Interview," written (wherein lies its special interest) by M. Ollivier, the French statesman who has remained notorious as having used in 1870 the unfortunate phrase, "The French army is absolutely ready to go into action, even to the last button of the last gaiter." Here, apparently for the first time, is told from the French point of view the inner story of the negotiations which preceded the Schleswig-Holstein struggle, and students of modern history will find much that is valuable in these pages. At the present moment one reads with melancholy interest the vivid description of how great a part deadly disease played in the life-story of Napoleon III. During the last seven years of the empire the emperor was constantly ill; but the fact was more or less hidden from those around him, although his ministers were, of course, aware that often the extremity of pain which he was enduring compelled him to leave the councils over which he used to preside with the greatest regularity and intelligence. M. Ollivier, in the second number, continues his diplomatic and political confessions with a long account of the first Hohenzollern candidature—in other words, the history of how the present King of Roumania, a prince of the house of Hohenzollern, became sovereign of the eastern state over which he still reigns, and to which the heir is his nephew, equally allied by marriage to the British sovereign. M. Ollivier is apparently of opinion that Bismarck hoped to plant out cadets of the Royal Prussian family all over Europe, and that, emboldened by the success of this attempt in Roumania, he plotted the disastrous Hohenzollern candidature to the throne of Spain, which practically led to the outbreak of the Franco-Prussian War.

## THE CENTENARY OF COMTE.

Auguste Comte, one of the comparatively very few thinkers who may be said to have founded a new religion, was born a hundred years ago, and his centenary has inspired M. Brunetière, the distinguished French philosopher and critic, to write a courteous analysis of Comte's theories, writings, and general opinions on the intellect of some thinkers who may be said to have been even greater than himself. He points out that Comte had a great respect for all that had gone before, in this matter differing from any of his disciples, who seem far more anxious to destroy than to preserve the edifices built up in the course of ages.

## OTHER ARTICLES.

Other articles include a short scientific summary of the world's volcanic eruptions, by M. Dastre; a detailed account of the battle of Oudenarde, by the Comte d'Haussonville; and yet another section of M. Lenthéric's picturesque and yet most detailed description of the northern coast-lines and seaport towns of France.

## NOUVELLE REVUE.

AS usual the *Nouvelle Revue* for June is composed of a very great number of short articles, of which perhaps the best is that, by M. Buret, entitled "The Rights of War, and the Rights of the Wounded." Next May, at St. Petersburg, will take place a great international congress of Red Cross societies. The last was held at Vienna in 1893, at a moment when none foresaw the grievous struggle which has just come to an end. It is said on the Continent that, in view of recent events in South Africa, certain articles of the Geneva Convention will be there revised. This will be more necessary owing to the fact that the famous convention omitted to deal both with the captive wounded, and with the case of prisoners of war. During the Franco-Prussian War the German military authorities complained bitterly that certain articles of the convention made it easy for active combatants to pose when convenient as doctors and ambulance men, and the same complaint was made in Great Britain apropos of the many Russian, Dutch, and American ambulances which attempted to make their way into the Boer lines.

## THE MARTINIQUE DISASTER.

The Martinique disaster is the subject of a paper by M. Desmarest, who gives some little-known details concerning the doomed town of St. Pierre. He points out that many of the houses were made of wood, and so caught fire almost at once. The one survivor, a negro, happened to be confined in an underground prison, and so escaped. It is clear that the island had had ample warning, for during the last hundred years several terrible earthquakes took place, that of 1830 completely destroying Fort de France. Many ancient prophecies foretelling the awful eruption of this spring were current in the island, but even the more superstitious inhabitants fully believed that this would not occur for at least another thousand years.

## THE JAPANESE WORKMAN.

According to M. Dumoret, the Japanese workman is far more pleasantly situated than his European brother. In the country of flowers, strikes are absolutely unknown, for as yet trade unionism has made no way in the East. Every man makes the best bargain he can for himself, and, as a rule, for a time exceeding three years. A bad element in the working life in Japan is the existence of a professional intermediary who acts as go-between between men and masters, and who obtains a commission from both sides. Yet another regrettable fact is the immense number of children employed in the various factories. On the other hand, every house of business in Japan is regularly inspected by a government official, and as it is the custom to provide food for workers inside factories and workshops, this also has to be inspected and of good quality. The hours are very long, only one hour being allowed for meals during the whole day. Japan has long had something very like the British Employers' Liability Act in force, and the sick worker has a right to the best of hospital treatment. The Japanese, as America has discovered to her cost, is a first-rate emigrant, and soon becomes a formidable competitor to the native-born workman; for one thing, the Japanese artisan is very sober, and lives mainly on rice and fish. In Japan great resentment is felt at

to the fact that both in America and in Australia the Japanese are regarded as belonging to the same strata of humanity as do the Chinese. The Japs consider themselves, and justly so, very superior to the other yellow races, and would like to feel that they were welcome in those new countries where good workmen are scarce.

#### REVUE DE PARIS.

THE June numbers of the *Revue de Paris* are exceedingly good. We have noticed elsewhere M. Aulard's account of the Legion of Honor.

#### THE COST OF THE BOER WAR.

M. Viallate offers a careful analysis of the effect on British finance of the South African war. The French writer has long made a study of the British financial system and of British taxation, and he points out that there was practically no provision made for such a war as that which has just been concluded. When, in the October of 1890, the ministers were obliged to go to the country for money, they did so feeling certain that a comparatively small sum would suffice to cover the cost of the then small expedition to South Africa. Three months later, however, Parliament had again to be asked for money; and more than a year later,—that is, when the budget of 1901 had to be presented to the country,—the Chancellor of the Exchequer was compelled to admit that the war was in no sense a small war; but, in point of view of finances, a very great war. In two years and a half the war, which was at first spoken of as a trifling matter, had cost the country more than twice the immense sum spent over the Crimean War. The French writer does not consider that with the end of the war will come an end of the supplementary expenses connected with the late struggle; he points out that even the Liberal Imperialists are extremely desirous of promoting costly army reforms, and of adding yet further to the navy; and he says that had it not been for the death duties imposed by Sir William Harcourt in 1894, Sir Michael Hicks-Beach would have had to discover new sources of taxation, and, even as it is, he believes that soon British free trade will be but a name.

#### THE RUIN OF A CITY.

M. Charléty contributes a striking historical article of the kind French writers so delight in. In it he describes the ruin of the one-time prosperous medieval city of Lyons during the reign of Louis XIV. The story is a curious one, and shows clearly why the Revolution found so many ardent adherents in the famous silk-making town. Unfortunately, Lyons was known to be a wealthy city; accordingly, whenever the Sun King went to war, built a palace, or led a campaign against heresy, he immediately taxed the unfortunate townspeople as heavily as possible. Even in those days there was a great dislike to direct taxation; accordingly, the new tax was not called a tax, but by some other name. Office-holders were compelled to buy in their offices; the town had certain rights, and it was asked to pay for the privilege of keeping them. Then the revocation of the Edict of Nantes proved a terrible blow to the silk industry. When the municipality begged leave to light up the streets, the king said he would allow this to be done if his government was given, as it were, the job. The townspeople were informed that they must pay a huge sum, but that in exchange the town would be thoroughly well lighted; the sum was

paid, but only a thousand lamps were provided. And this was but one example out of many. At last the industry by which the town lived was attacked,—that is, it was heavily taxed. Every weaver had to pay for the right of working his loom; and so, little by little, came ruin, and in 1715 the whole town became bankrupt. The great manufacturers,—for even in those days there were great manufacturers,—closed their manufactories, their workpeople emigrated or became beggars on the high roads, and the population dwindled. The facts concerning this extraordinary tragedy—for tragedy it was—have been carefully gathered together by M. Charléty after prolonged study of the archives of the town of Lyons, and they should be carefully studied by all those who wish to know why France parted with so little struggle from her monarchical system.

#### NAPOLEON AND THE POPULAR DRAMA.

That many-sided genius, Napoleon I., is still ever providing entertaining copy. M. Albert describes the great soldier's delight in the drama. He believed that the theater has a great influence on popular imagination; accordingly he greatly encouraged all those actors and actresses who made a point of playing patriotic plays. He did not care for literary comedy. To give an example: he was quite indifferent to Molière; but he delighted in the cheap drama,—that is, in those plays which celebrated his victories, and which predicted his future triumphs.

#### THE SHIPPING COMBINE.

Under the name of "The Ocean Trust," M. de Roussiers attempts to give his French readers an account of the great shipping combine. He declares that in England the fact has escaped most people that the shipping combine is really intimately associated with the great American railway systems, and he attempts to analyze the effect of the combine on any future European war.

#### THE SPANISH MONARCHY.

Spain is of more importance to France than she is to any other European country. Many patriotic Frenchmen hope that the day will come when the most fertile and most ill-governed of European countries will become French soil. Accordingly, the course of the Spanish monarchy is closely watched and criticised in France. M. Bérard gives a sad account of the relations existing between the Spanish court and the Spanish people. Madrid, where the young King has lived most of his life, is absolutely the capital suited to an autocratic monarch. The stately city is far from the commercial centers of Spain, and during many centuries the great Spanish empire was governed from Madrid. Now, however, Spain, shorn of her colonies, is less willing to take her orders from Madrid. Even the country clergy have no love for the young king and his mother; and were it not for the strong personal support of the Pope, they would find in each country priest a more or less disguised enemy. M. Bérard gives a curious account of how great a part the colonies played in the life of the modern Spaniard. Apparently the Zollverein theory was in full force; a Spanish colony was practically compelled to deal with Spain only; even absolutely foreign produce reached each Spanish colony *via* a Spanish port. During the last four years, thanks to the intervention of the United States, the colonial sources of revenue has practically come to an end, and this has disorganized the whole of Spanish trade. From one

point of view only has Spain benefited by the loss of her colonies. In the old days a constant tide of emigration of the country's strongest and healthiest sons was ever set toward "Greater Spain;" now, however, the Spaniard stops at home, and accordingly prosperity has come back to many a village and townlet, to say nothing of certain seaport towns quickly becoming centers of activity.

## LA REVUE.

IN *La Revue* for June the interest, as usual, is highly varied. Count Tolstoy's reflections on education are noticed elsewhere.

## DUELLING.

M. Emile Faguet, of the French Academy, discusses duelling. French duels, he says, become rarer and rarer, and are seldom fatal, one great reason for which is the excellence of the French seconds. Many Russian, Austrian, and Italian duels, however, are still fatal.

Therefore M. Faguet believes in the usefulness of the recent "Ligue contre le Duel" in France. He has joined himself, and obtained the expected reward—being called a coward. The objects of the league are "to preach everywhere the stupidity of the institution, and afterward obtain legislation."

As punishments for duellists, he suggests depriving them of their rights of citizenship and a little prison—both for conqueror and conquered. The provoker of the duel shall not escape, nor *le provoqué*. As for the seconds, they are accessories; make it dangerous and difficult to be a second, and you strike a fatal blow at duelling.

But M. Faguet would not entirely abolish all duels, only "*tous les petits duels bêtes*," and all futile duels; he would allow them for "very grave causes, for those matters which no one would willingly bring before the courts, and which it would be undesirable to have so brought forward."

## THE PSYCHOLOGY OF LYING.

After reading the article by M. Camille Mélinand on this subject, one realizes as never before that all men (and all women and children) are liars; and that in our own days it is extraordinarily difficult to be otherwise. For M. Mélinand would class as *mensonges* any word or act (negative or positive) which caused another either to be ignorant of anything, or to get the slightest erroneous impression. Extremely sincere people are often extremely blunt and unpopular, but M. Mélinand thinks this difficulty can be overcome. All suppression is a form of lying,—negative lying. Politeness forbids our saying what we think; modesty and reserve make us conceal our feelings or assume indifference when we are acutely anxious,—all is lying.

The following classification of lying is interesting. There is first lying by making up something entirely. This is the only kind of lie universally so-called,—a real out-and-out lie. It is also the most dangerous kind, and thus the rarest. Lying may also be done simply by suppression of something, or by exaggeration, or by embroidering facts, the most common form of all.

As for the motives which tempt to lying, cowardice is far the commonest. We are not brave enough to face the natural consequences of our conduct. Passion is responsible for an indefinite number of lies, hatred and detraction in particular. And as for love, lovers lie endlessly. Party spirit, the passion for money and

for power and success, are also all prolific fathers of lies.

But, although rarely, temptation to lie comes through kindness, charity, and self-sacrifice.

And yet M. Mélinand considers it possible to be absolutely truthful, never to lie in any of the senses in which he uses the word. In children lying should be more severely punished than any other fault.

## OTHER ARTICLES.

Many of the other articles are excellent. Carmen Sylva writes idealistically of the nobleness of woman, an article refreshing by its "Excelsior" spirit. M. Novicow writes of the alleged superiority of the Anglo-Saxons, an article by no means always just. Mr. J. A. Pease and Sir Charles Dilke write of slavery in English lands, chiefly Zanzibar and other parts of Africa. M. Henry Bérenger greatly admires "Monna Vanna."

## THE GERMAN MAGAZINES.

THE June number of the *Sozialistische Monatshefte* deals almost entirely with the great problem of strikes. The opening paper is by Edouard Ahseele, of Ghent, and tells the story of the fight for universal suffrage in Belgium. Strikes have played an important part in the struggle, which, although not yet quite successful, will be so, he says, in the course of a year or so. Edward Bernstein, of Berlin, continues the subject, going more into the details of that particular political strike. The strike problem in Sweden is dealt with by Hjalmar Brunting, of Stockholm, who rejoices in the great victory of the workmen when last on strike. This appears to have been the first general strike the country has experienced. Some 116,000 workmen "came out," and the town became paralyzed in consequence. No electric cars, no omnibuses, no cabs, no vehicles of any sort could run, all factories and warehouses being at a standstill. All this was effected by careful organization for over fifteen years.

An interesting article upon the language question in Bohemia is contributed by Leo Winter, of Prague.

In the *Deutsche Revue*, Lady Hely Hutchinson describes some of the good work done by women in South Africa during the war. As wife of the governor, she had naturally many opportunities of coming into personal touch with those who were engaged in work for the sick and fighting soldiers. After describing many little acts of kindness for which there can be no reward save that coming from their performance, Lady Hutchinson protests against those women who went up to the battlefields, not to assist, but to see what could be seen. In Cape Town she says that for eighteen months a band of devoted ladies met in a bare room, and every day from ten to four prepared comforts for "Tommy." The nurses naturally come in for a special word of praise.

A German diplomatist writes upon the value of England to Germany. He says that, according to the German newspapers, there is absolutely no value, but those who reflect and study the question are bound to admit that there is a great deal. England's action in 1848, 1864, 1870-71, in the Samoan question, and in the stopping of German ships in African waters, has excited a bitter feeling against her; but in the diplomatist's opinion, it in no way excuses the opposition to everything English which has been going on in Germany during the last three years. England's chief use, however, seems to be to keep the balance even in European politics.

# THE NEW BOOKS.

## NOTES ON RECENT AMERICAN PUBLICATIONS.

### SUMMER READING ABOUT NATURE.

"Nature Portraits" (Doubleday, Page & Co.) is a portfolio of studies with pen and camera of American wild birds, animals, fishes, and insects. There are fifteen large plates and many smaller illustrations by the most skillful nature photographers, among whom Mr. A. Radclyffe Dugmore and Mr. W. E. Carlin easily rank as experts. The accompanying text is by Professor Bailey, the editor of *Country Life in America*, and is written in his usually happy vein. The work, as a whole, represents the high-water mark of American achievement in the interpretation and presentation of animal life.

The "American Sportsman's Library," edited by Caspar Whitney (Macmillan), is an unusually attractive series of books, and will interest not only the amateur sportsman, but every American nature-lover, whether he be a devotee of rod and gun, or not. The volume on "The Deer Family," written by President Roosevelt, T. S. Van Dyke, D. G. Elliot, and A. J. Stone, appeals more especially, perhaps, to the dweller in northern latitudes, where the animals described in this volume have their habitat. President Roosevelt describes the various species of North American deer and antelope, with which he has for many years been familiar through his expeditions in the West, especially in the Rocky Mountain region. Mr. Van Dyke contributes sketches of the deer and elk of the Pacific coast. The caribou is described by Dr. Elliot, and the moose by Mr. Stone. In a volume on "Upland Game Birds" there are excellent descriptions of various varieties of quail, partridge, grouse, ptarmigan, turkey, woodcock, plover, and crane, with a special chapter on the quail and grouse of the Pacific coast. These chapters, written by Mr. Edwyn Sandys and Mr. T. S. Van Dyke, not only give accurate descriptions of the birds considered, but add full information regarding the regions to which they are native, and all other matters that the hunter needs to know relating to the birds and their habits. A volume to which the late Dean Sage and Messrs. C. H. Townsend, H. M. Smith, and William C. Harris have contributed is devoted entirely to "Salmon and Trout." The book is full of practical suggestions to anglers about the casting and working of flies, selection of tackle, and all the approved methods of fishing for these "gamest" of American fish.

For a comprehensive account of all the species of fish found in America north of the equator, we take pleasure in referring the reader to the new volume on "American Food and Game Fishes," by President David Starr Jordan, of Stanford University, and Dr. Barton W. Evermann, of the United States Fish Commission (Doubleday, Page & Co.). While this book is the work of eminent specialists, its aim is to furnish information to the multitude, and it may be truly described as a "popular" work. The book takes for granted on the part of the reader, as the introduction states, "a knowledge of ordinary English as used by Americans of fairly good education, and a willingness to make an honest effort to find out more about the food and game fishes

of our country." The book is technical only so far as is necessary to enable its readers easily and readily to identify any American fish that is used as food or game. Two sizes of type have been used in printing the book, the smaller size for those who would study fishes with specimens in hand, and the larger for those who read about fishes, whether the fishes themselves are present or not. The book also gives an account of the geographic distribution, habits, life-histories, and commercial and food value of fishes, together with many points of interest to the angler. Many photographs of live fishes were taken for this work by Mr. A. Radclyffe Dugmore, and the plates made from these photographs greatly add to the value and attractiveness of the book.

Another book that has special attractions for anglers and naturalists is "The Brook Book," by Mrs. Mary Rogers Miller (Doubleday, Page & Co.). This is an interesting study of the various activities of brook existence throughout the four seasons of the year. It is a presentation not only of the life of the brook itself, but of its manifold accompaniments and of the varied forms of nature with which the brook's rise and progress is associated.

In a little work entitled "Among the Waterfowl" (Doubleday, Page & Co.), Mr. Herbert K. Job gives an account of many of the waterfowl found in the Northern and Central States of the Union, accompanied by numerous photographs from nature, most of which were secured by the author himself. The whole influence of Mr. Job's book is to discourage the shooting of living birds, and to substitute as a pastime the practice of "hunting with a camera." Mr. Job's pictures are remarkably successful, and the enthusiastic amateur will be tempted to make some similar efforts on his own account.

Mrs. Martha McCulloch-Williams' "Next to the Ground" (McClure, Phillips & Co.) is a delightful series of chronicles of country life, including not a few suggestions of curious and out-of-the-way information, all of which is related in the most entertaining fashion. If we cannot locate precisely the American farm which Mrs. Williams describes, and where all the experiences of her book took place, we are at least assured by the writer that it was a Southern countryside somewhere between the Alleghanies and the Mississippi, nearly midway between the mountains and the river. The things that Mrs. Williams writes about are every-day happenings about the farm, but seldom have they been recounted in so vivacious a record.

There is a further revelation of boy-and-girl life on the farm in a little book entitled "The Travels of a Barnacle," by Mrs. James Edwin Morris (New York: The Abbey Press). The main purpose of the book, however, is to present a series of studies of sea life, for which materials were gathered by Mrs. Morris in the course of observation tours in a glass-bottomed boat in the Bay of Avalon, off the coast of California. Besides these studies of the crab family and their neighbors, there is a chapter on "A Day With the Birds," and one on "Life in a Marsh."

Among the new books that appeal to the amateur gardener, one of the most exhaustive is "The American Cultural Manual," Part I., by Prof. J. L. Budd, of Iowa State College of Agriculture, assisted by Prof. Hansen, of the South Dakota Agricultural College (New York: John Wiley & Sons). This work gives a full statement of the leading principles and facts connected with the propagation, culture, and management of fruits, nuts, ornamental trees, shrubs, and plants. It is illustrated by more than one hundred drawings and explanatory designs.

For the English gardener there is a full supply in Lane's numerous publications adapted particularly to the wants of English country gentlemen, the most of which is entitled "In My Vicarage Garden and elsewhere," by the Rev. Henry N. Ellacombe.

"Content in a Garden" is the title of a beautifully illustrated volume of essays and botanical studies by Canby Wheeler (Houghton, Mifflin & Co.). The marginal illustrations of the volume are supplied by Dora Wheeler. In the main the book is a pleasant description of the garden in the Catskill Mountains, where the writer attempts to interpret the thoughts and feelings which she fancifully attributes to all her plants.

James H. Emerton indulges in the fond hope that his book on "The Common Spiders of the United States" (Ginn & Co.) will help to lessen the popular prejudice against spiders,—and lead the public into such acquaintance with these insects as is now secured by many students with birds and butterflies. Emerton states that in the neighborhood of any city in this country there are at least three or four hundred species of spiders, and that thus far there have been few collections made. Mr. Emerton describes in his book only those species that are well known and have been described before. He omits all rare and unusual species. The book is illustrated from drawings and photographs made by the author, who has been an enthusiastic collector for many years.

For excellent school readers, which will do much to advance nature study in this country have recently been brought to hand—"Seaside and Wayside," No. 3, by Julia May Wright (Boston: D. C. Heath & Co.), and "Fables in Prose and Poetry," by Gertrude L. Stone and Alice Fickett (Ginn & Co.).

#### BOOKS OF TRAVEL AND DESCRIPTION.

For a full and up-to-date account of the extension of Russian influence in northern Asia we are indebted to George Frederick Wright, of Oberlin College, whose two-volume work on "Asiatic Russia" has just been published (McClure, Phillips & Co.). An article by George Wright, on "The Russian Problem in Manchuria," appeared in the REVIEW OF REVIEWS for July, and formed an important contribution to our knowledge of present-day conditions in the far East

from the American point of view. As Dr. Wright is a geologist, it was natural that in the extended journey which he made through the region described two years ago he should have an eye primarily for the physical conditions of the country. Dr. Wright is, however, a student of people as well as of rocks and water-courses, and his views of the modern development of this wonderful land are extremely interesting to the sociologist. As our readers may have gathered from Dr. Wright's REVIEW article, to which reference has already been made, his predilections toward the Russian administration are favorable rather than otherwise. His grounds for this belief are well set forth in his chapters on social, economic, and political conditions in the present volume. While his account of the various features of the Russian occupation of Siberia is full of information, much of which has never before been accessible to American readers, there are also interesting chapters on the geological history, the climate, and the flora and fauna of the land. Altogether these two volumes sum up the impressions of an exceptionally shrewd observer of political and social conditions as affected by physical environment.

"Highways and Byways in Hertfordshire," by Herbert W. Tompkins (Macmillan), is a volume well packed with minute information about a region of England comparatively little known to the traveler from other lands. Like other books in the same series to which we have made allusion from time to time in these pages, this new volume is a combination of the better class of guide-books, with a condensation of local history of the highest order. We can hardly imagine the time when such books will be written about any portion of the United States; but in a country like England, rich in historical associations, they fill a distinct niche. The illustrations for the present volume were furnished by Mr. Frederick L. Griggs.

"The World's Shrine" is the title chosen by Virginia W. Johnson for her sketch of Lake Como (New York: A. S. Barnes & Co.). In her description of this beautiful Italian lake the writer traces some of its historical associations, especially those connected with the life of the younger Pliny on the shores of Como.

Hilaire Belloc's "The Path to Rome" (Longmans) may perhaps be counted as a book of travel, although the most cursory examination leads one to conclude that that was not the author's primary purpose. There is in the story, however, a suggestion, at least, of actual journeyings, and for lack of any definite basis of classification we may group the book among the travel tales. To those disposed to take the author seriously,—as he himself does not,—we may say that the journeyings began at Toul on the Moselle, and ended at Rome. The tedious portions of the way are enlivened by the writer's inexhaustible fund of song and story, and the individuality of his style so enchains the reader's attention that the work's deficiencies as a guide-book are soon forgotten.

# INDEX TO PERIODICALS.

Unless otherwise specified, all references are to the July numbers of periodicals.  
For table of abbreviations, see last page.

- Abtithi Fur Brigade, A. Heming, Scrib.  
Accident Insurance for Workmen, A. F. Weber, PSQ, June.

Vol. XXVI. No. 152.

Entered at N. Y. Post Office as Second-class matter.  
 Copyright, 1901, by THE REVIEW OF REVIEWS CO.

Price 25c. \$2.50 a Year

# Armour's

## Extract of Beef

Is the best extract of the best beef in the kitchen or sick-room for preparing soups, broths, beef tea, sauces, entrees, etc.

Sold by all Druggists and Grocers

## Tomato Bouillon

A piquant relish for meat, game, vegetables and for preparing oyster cocktails, tomato bouillon, etc.

Adapted for use with fresh ripe tomatoes, or as a relish for meat, highly concentrated and deliciously seasoned. Will keep in any climate. It should not be compared to other tomato bouillon and soups for preparation, as it is not only a piquant relish, but a choice tomato stock for cooking purposes.

Sold by all Grocers, Druggists, and Ice Men.

It is No. 2.

For lovers of good things to eat and drink. Asparox has the full rich flavor of fresh asparagus.

It is a delicious and healthy food, and is sold by all Grocers and Druggists.

Sold by all Grocers and Druggists

It is a delicious and healthy food, and is sold by all Grocers and Druggists.

Two Sizes, 25c and 75c

Armour & Company Chicago

## *Review of Reviews.*

XXVI.

NEW YORK, SEPTEMBER, 1902.

No. 3.

### THE PROGRESS OF THE WORLD.

With Congressional elections pending, and State campaigns on foot in many of our commonwealths, the of the United States, nevertheless, were much more interested last month in things than they were in party politics. We have frequently remarked, this country is not enough at present not to be greatly affected by those bitter prejudices and fierce animosity of party—amounting almost literally to a civil war—that are inevitable certainly at periods of a President's career, but that ought not to be allowed. Nothing could be more obvious than that the country is well satisfied with President McKinley's conduct during his first twelve months as Chief Magistrate. It will be one of the 14th of the present month, since the death of McKinley's tragic death at Buffalo, that Mr. Roosevelt will administer the oath of office to his successor. Mr. Roosevelt has fulfilled all reasonable expectations. He has shown marvelous ability in every direction, has given untiring industry to the varied details of his great office and has borne the strain with unfailing vigor and imperturbable good temper.

He has stood strongly for the policies which he believed to be wise and right for the country, without sacrifice of agreeable personal relations with the leaders of his own party, and, in the eyes of all public men of whatever affiliation. His appointments have been felicitous, his general, highly praised. He holds the confidence of the Democratic South almost as fully as of the Republican Northwest. He is a *grata* in New England, and is idolized in the Missouri River. He maintains good relations with the party leaders of New York, Pennsylvania, and has the hearty approval of the plain people of those great States. That he will be renominated in 1904 is now considered even more probable than was Mr. McKinley's renomination in the middle of his first

term. Never, indeed, since the early days of the Republic has it appeared so likely that a President would be his own successor. This, of course, in a sense pertains to 1904 rather than to 1902. But it is well to appreciate the fact that this remarkable popularity of the President, and this quite general approval of the administration as a whole, form a very important element in the political atmosphere that surrounds the electoral situation this fall. The politicians have their own all-powerful reasons for partisan effort; but people at large, being pretty well satisfied with things as they are, and having no political objects of their own at stake, are rather indifferent than otherwise, through sheer contentment and preoccupation. The great Republican argument of the year will be the advisability of letting well enough alone. It would be strange if the Democratic party should not regain something of its normal strength in Congress; but it is scarcely to be believed that the pendulum will swing so far back as to put the opposition party in control of the House.

#### *Bumper Crops and Prosperity.*

Next to the widespread feeling of confidence in President Roosevelt and the administration, the best reliance of the Republicans for success this year will lie in the marvelously prosperous state of our agriculture and industry. It is now certain that the crops of 1902 are to exceed in quantity and value those of any previous year in our history. Last year the corn crop, which was a partial failure, amounted to 1,522,500,000 bushels, the average of the ten preceding years having been about 2,000,000,000 bushels. Last year, therefore, the corn crop was only three-quarters of the normal yield. This year it is admitted on all hands that the crop will be at least 1,000,000,000 bushels greater than last year, and *Bradstreet's* declared in the middle of August that "there is a prospect of 1,250,000,000 more bushels of corn being raised than a year ago." In our judgment, it is not at all unlikely that the corn crop may

exceed 2,800,000,000 bushels. Much the largest previous corn crop was that of 1896, which amounted to a little less than 2,284,000,000 bushels. Last year's corn brought a high price, so that those farmers who were fortunate enough to have a crop made a great deal of money. But it needs little demonstration to make it plain that a generally abundant yield at lower prices contributes more to the general prosperity than a scanty yield at proportionately high prices. One of the results of a billion bushels of extra corn must be to lower the price of meat. The defense of the great beef-supply companies against the charges of extortionate prices has been the shortage of the corn crop. This excuse now disappears, and the retail butchers ought before long to be obtaining their stock at the old prices.

The smaller corn crop of last year was counterbalanced by the extraordinary yield of wheat, much the greatest on record. The wheat crop of 1901 amounted to nearly 750,000,000 bushels. Four hundred and fifty million bushels has generally been considered an average American wheat crop. Only twice before last year had the crop exceeded 600,000,000,—namely, in 1891, when it was 612,000,000, and in 1898, when it was

IN THIS WHEAT BY AND BY!  
(Expectant Europe and the American harvest.)  
From the *Inquirer* (Philadelphia).

675,000,000. In 1899 it was 547,000,000, and in 1900 a little more than 522,000,000. The *New York Times* last month, rejecting the Government estimates of this summer's wheat yield, was of the opinion that it might be nearly or quite as great as that of last year. A contributor to this number of the *REVIEW*, Mr. William R. Draper, estimates it at fully 700,000,000 bushels, which we do not believe at all too high. Improved methods of farming in the United States have made wheat both a surer and a more prolific crop than it was some years ago. Like corn, it enters importantly into the agricultural production of nearly all the States. The crop is divided about evenly between winter and spring wheat. Northern Texas now grows wheat in abundance.

The South was busily engaged last month in picking, baling, and marketing the new cotton crop. Early in the season the prospects had been favorable for the largest and finest crop ever grown. Considerable damage was done in some localities, as the crop was maturing, by unfavorable conditions of weather. But with reports and estimates somewhat conflicting as these comments were written, there was a chance that the output might reach almost 12,000,000 bales, as against an average for the previous four years of about 10,500,000. Our Southern cotton crop has doubled in twenty years, thus showing a very much larger relative gain than the wheat and corn of the West, each of which has, roughly speaking, increased by about 50 per cent. in two decades.

These three great crops by no means exhaust the list of those products which make up our current agricultural wealth. The oat crop of 1902 is the largest we have ever had, and may amount to from 850,000,000 to 900,000,000 bushels. And although this particular cereal is not enough in demand to justify a vast increase of acreage, we shall, doubtless, within two or three years, be producing an average of a thousand million bushels of oats per year. The barley crop is estimated at about 120,000,000 bushels, as against an average for some years past of perhaps 70,000,000. The volume and value of pasturage and hay are more difficult to estimate than some of the other crops, but undoubtedly these have been considerably greater this year than ever before. The grass crop for the most part finds its way to the market in the form of dairy products, wool, beef and mutton, hogs, horses, and mules. The number of farm animals and the value of marketable animal products of the farm have increased by about 100 per cent. in twenty years.

*Intelligence and Prosperity.* We publish elsewhere some interesting agricultural statistics compiled by Mr. William R. Draper, entitled "The Farmer's Balance Sheet for 1902," and a brief article on "The Diffusion of Agricultural Prosperity," from the pen of the distinguished political economist, Prof. Henry C. Adams, of the University of Michigan. Prof. Adams' analysis will bear very careful study, for it contains some profound underlying truths. Nothing could be a greater mistake than to take a purely materialistic view of the prevalence of prosperity in the United States at the present time. Moral and intellectual conditions, forming the essence of our civilization, are at the basis of all this agricultural development and industrial

progress. The growth and diffusion of wealth in the United States would have been absolutely impossible but for the maintenance of our democratic ideals. The value is not, after all, in the crops, but in the man who produces them, who owns the land, who receives the income, and who expends it for the advancement of himself and his family in rational ways, that also benefit the neighborhood and the country. Intelligence is what makes American farming prosperous. We beg to call attention to another article in this number of the *Review* from a Western contributor, Mr. Matson, on "Improved Conditions in the American Farmer's Life." With mortgages paid off, and a sense of freedom and prosperity, the typical farmer of the West is asserting his rightful place as the proprietor of an estate and as a well-established citizen of a great country. He is improving his farm buildings; grading up his live stock; learning from the authorities of his State agricultural college and from the Farmers' Institute of his county more and more about scientific agriculture; and providing for his family more and more of the luxuries of life that are enjoyed by the banker and the successful merchant or professional man in the county town.

*Improving Neighborhood Life.* The farmer is, furthermore, as Mr. Matson shows, turning his attention to the improvement of neighborhood conditions, so that country life may not be too

A TYPICAL CONSOLIDATED COUNTRY SCHOOL, SHOWING WAGONS FOR TRANSPORTING PUPILS. THIS ONE IS IN INDIANA.

irksome for his children. While free rural delivery of the mails is by no means universal as yet, the telephone is found in almost every farming neighborhood of the country. What Mr. Matson says about the progress of the movement for consolidating country schools is worthy of attention; and this is a subject to which we shall in future numbers of the *Review* recur with particular attention and emphasis, for it is a matter of profound significance. In the towns there have been vast strides during the last quarter of a century in public-school equipment and instruction, while until very lately the old-fashioned district schools of the rural neighborhoods had been either at a standstill or were positively retrograding. Under the new impulse there is to be not merely a radical, but a revolutionary change in country schools. The diminutive "red schoolhouse" of the North and the log-cabin school of the South have about served their day. Something vastly better and more modern is easily within reach of thousands of rural neighborhoods.

*Consolidating Rural Schools.* The new mandate that has gone forth is to the effect that neighboring districts must consolidate in order to build a good central school building, with several rooms and several teachers, and a consequent opportunity for grading the scholars. It is further decreed that the children must be brought to this central school on a cooperative plan, in

suitable conveyances for protection from cold and wet and fatigue. Further, it is in the air that the new consolidated country school must adapt its methods of instruction to the real conditions of life. It must be a social and intellectual center for grown-up people as well as for the children of the region. It must have an ample piece of ground, and this must be kept in the most perfect order, as one of the primary interests and duties of the school. Nature-study must enter largely into school life and work, and a positive taste for rural pursuits and for the elements of the natural sciences must be inculcated. The school grounds must furnish object lessons in the planting and maintenance of trees and flowers, and, in so far as possible, may well be utilized to teach practical gardening. A certain amount of manual training for both girls and boys should enter into the work of the school, and every neighborhood should strive to surpass all others in its zeal to secure good teachers by offering proper inducements.

*New Educational Enthusiasm.* Instances of precisely this sort of school development are fortunately no longer isolated. Great educational leaders and official heads of school systems, including some of the foremost State superintendents of education, are making themselves the zealous and eloquent apostles of this new movement for the regeneration of country schools. The Southern Education Board, under the presidency of Mr. Robert C. Ogden, of New York,—with its membership largely made up of Southern professional educators,—backed financially in its work by the General Education Board of New York, is making this movement for the improvement of rural schools the object of its chief solicitude. It has been going about

its work in various ways. First, it has been leading a propaganda for local taxation for school purposes; second, it has stimulated in many ways the work of institutions which are training teachers; and, third, it has in various instances directly promoted district-school consolidation. These objects were held constantly before the attention of the great summer school for teachers held in June and July at Knoxville, Tenn., where it enjoyed the hospitality of the State University. It was organized by President Charles W. Dabney of that institution, in association with Professor Claxton, recently

President Dabney.

Professor Claxton.

ORGANIZERS OF THE SUMMER SCHOOL OF THE SOUTH.

of North Carolina, who is henceforth to be the head of the department of education in the University of Tennessee. The enthusiasm for bettering the condition of the South through educational progress, as manifested in this summer school, was, by report of many expert witnesses, a fresh evidence that in the South, as well as in the West, education is now coming to be recognized as the most important of all public interests and the chief task of local statesmanship. This is very auspicious.

A CLASS IN MANUAL TRAINING, SUMMER SCHOOL AT KNOXVILLE.

*Knoxville and Other Summer Schools.* More than two thousand teachers came together at this great summer school at Knoxville, and a great number of able instructors were assembled. The General Education Board has been so impressed with the extraordinary value of this work that it has promised a generous contribution toward its enlargement next year. As we have already remarked, manual training, consolidation of country schools, and the

THE SCIENCE HALL OF THE UNIVERSITY OF TENNESSEE.

thorough adaptation of school work to actual problems and conditions were constantly emphasized at Knoxville, and President Dabney is one of the foremost exponents of these modern views to be found in the entire country. While this summer school at Knoxville was undoubtedly the center for the country, this summer, of enthusiasm for rural civilization and progress in the half of the country that most needs school reform, it should not be forgotten that an admirable summer school for Virginia teachers was carried on at the University of Virginia, at Charlottesville, with nearly a thousand members enrolled; that South Carolina had an excellent summer school for teachers at Rock Hill, with leadership of great earnestness, and that several more strictly local assemblages of teachers were in session for a period of several weeks in North Carolina, Alabama, Louisiana, and other Southern States. The great summer schools of the North,—as, for example, those held by Columbia University, Harvard, and the University of Chicago,—have had prosperous seasons, and these, together with the Chautauqua assemblies and other conferences and gatherings of an educational nature, have added something to the training and much to the ideals and inspiration of many thousands of Northern and Western teachers. But, generally speaking, it is the well-paid teacher of the towns and more prosperous villages who can afford to attend these fine summer schools. For New York, Pennsylvania,

New England, and the North in general, the problem of the country school must be faced, as unquestionably it will be, with ever-increasing comprehension of its importance. Meanwhile, in the Northern cities the vacation schools have made much progress in this past summer.

*Platforms of the Teaching Profession.* The great yearly convention of the National Educational Association, which was held at Minneapolis in July, seemed to us to touch high-water mark in its appreciation of the vital needs of our schools, and in its consciousness of the duty and opportunity of the teaching profession. In its series of general resolutions it declared that the common schools of this country "are the one great agency upon which the nation is to rely for a barrier against the setting up of class distinctions which have no place on American soil." Having expressed its ideal of the "complete education of the child," it declared as follows concerning the country schools:

We believe that it is both just and possible to keep the country schools in the foregoing, and all respects, up to the highest standard of excellence and efficiency. The movement to consolidate the weaker districts in the country, and to provide public and free transportation for the pupils to and from the schools, tends to that end.

It made other declarations in consonance with the new movement for vitalizing school life and work, and bringing it all into direct relation with

the moral and material welfare of the community. The Summer School of the South at Knoxville, to which we have referred, in its declaration of principles included the following sentences, which seem to us to sound the keynote of the new school movement not merely for the South, but for the whole country :

If an increased expenditure of money is to be of lasting value, a more intelligent public interest must be brought to bear upon our schools. But even greater than the need of money and interest is the need of intelligent direction.

A mere extension of the present school term with the present course of study will not meet the needs of the children. The lines of development in the South must be both agricultural and mechanical. Our people must bring a trained brain and a trained hand to the daily labor. Education should be a means not of escaping labor, but of making it more effective.

The school should be the social center of the community, and should actively and sympathetically touch all the social and economic interests of the people. In addition to the usual academic studies, therefore, our courses should include manual training, nature study, and agriculture.

To secure more efficient supervision, to encourage grading, and to broaden the social life of the children, we favor the consolidation of weak schools into strong central schools. It is better in every way to carry the child to the school than to carry the school to the child.

We endorse the movements recently made by the women of the South for model schools, built with due regard to sanitation, ventilation, and beauty.

Teaching should be a profession, and not a stepping-stone to something else. We therefore stand for the highest training of teachers, and urge the school authorities of every State to encourage those who wish to make the educating of children a life profession. We call upon the people to banish forever politics and nepotism from the public schools, and to establish a system in which, from the humblest teacher to the office of the State superintendent, merit shall be the touchstone.

The South will have a great work on its hands if, indeed, it is to make good the brave determination of its new educational apostles; but its school reforms are in the hands of men who have earned the right to lead, and who have already won the prestige of success in their individual undertakings.

Thus the prevailing European idea that American life is synonymous with greed and Mammon worship, and that the superior prosperity of the United States expresses it-

self chiefly in the gratification of physical wants and material aims, is as untrue to the facts as could well be. Mr. Michael Sadler, who is director in the British Education Department, has recently spent several months in studying educational work in this country, and he repeatedly expressed his admiration and astonishment at the comparative devotion of the United States to intellectual and moral objects, and especially at the unprecedented development of educational work of all grades. An occasional visitor of great insight, like Mr. Sadler or Mr. Bryce, discovers the paradox of American life, which is that the abounding material prosperity of this country has grown out of its idealism,—its search for things not material. Russia has a vast population and a tremendous agricultural area, but its people lack the intelligence needed to develop their resources. American devotion to the principles of equality and democracy, and to the policy of the universal training of the young, have given us our prosperity. We must, in turn, make it more than ever our business to utilize our abounding material resources for the more perfect and more complete work of adapting school training to the needs of every child.

A SNAPSHOT OF MR. MICHAEL SADLER, WITH DISTINGUISHED AMERICAN EDUCATORS AT THE RECENT MINNEAPOLIS MEETING OF THE NATIONAL EDUCATIONAL ASSOCIATION.

(Beginning at the left hand, the seven men are: 1, Aaron Gove, superintendent of schools, Denver, Col.; 2, Edwin A. Alderman, president of Tulane University; 3, E. O. Lyte, principal of the State Normal School, Millersville, Pa.; 4, Nicholas Murray Butler, president of Columbia University; 5, John A. Green, manager of the American Book Company; 6, Michael E. Sadler, of England; 7, N. C. Dougherty, superintendent of schools at Peoria. Messrs. Gove, Lyte, Butler, and Dougherty have each served as president of the National Educational Association.)

*Decline of  
Partisanship.*

Communities, whether rural or urban, that are engaged in advancing these local measures for the common good, may well be a trifle reluctant to drop it all at the beck and call of the politicians, and to separate for the electoral season into rival camps under the standards "Republican" and "Democrat." Efficiency, rather than partisanship, seems to be the demand of the day. Thus, Massachusetts approves of Governor Crane and his administration as thoroughly as possible,—not so much because he happens to be a Republican as because he has shown himself a thoroughly upright, business-like, and capable governor of Massachusetts, in whose hands the executive affairs of the commonwealth are so honorably and so ably conducted that everybody admires and nobody finds fault. In New York, Governor Odell has so carried on his administration that many of his strongest supporters belong to the class of independent voters. He has been business-like, and, so far as we know, the Democrats are not really finding any serious fault with him. They are trying to harmonize their factions and find a candidate upon whom all can unite, chiefly because it is their business as politicians to hold the party together for the sake of the future. They will, nevertheless, undoubtedly recognize the spirit of the period by selecting a candidate who, like Mr. Odell, will commend himself to the judgment of the community as an efficient man, and who, if elected, would carry on State affairs in a business-like rather than a partisan manner.

*What are  
the Party  
Issues?*

Local issues of various sorts are quite sure, under these circumstances, to play a larger part than usual in the political campaigns of the present season throughout the country. It is not very easy to find an intelligent man who, in friendly, private conversation, can at present show any great zeal of partisanship. The war with Spain was as much the work of one party as of the other, and the ratification of the treaty by which we acquired the Philippines was not wholly a Republican act. Whatever distinctions certain learned individuals may make, the country as a whole will not now find it easy to make any sharp issue between the parties out of existing differences of opinion as to our present Philippine policy. Some of the Democrats say that we ought to declare to the Filipinos that we intend in the future to give them self-government; but the Republicans reply that we are actually giving them self-government just as fast as it can be forced upon them, and that when you are doing your best to teach a child to walk, there is no particular use in proclaiming to him daily that he shall some time be permitted to

run. Nor will the country be likely to find any radical difference between the parties as respects such a question as how to deal with trusts and great combinations. Experience and study, observation and discussion, are giving us a clearer understanding of these problems every day. Meanwhile, there is no great divergence in the avowals of the two parties on the trust question, and certainly President Roosevelt and the Attorney-General have not hesitated to attempt the enforcement of existing laws. Nor, finally, is there much use in trying any longer to make the tariff question the football of politics. Business men of all parties and all sections arise in their might and demand that the tariff issue serve no longer as a mere party convenience. When the Democratic politicians had their opportunity to reform the tariff a decade ago, they modified it a little here and a little there, but they left it in general what it was before,—namely, a characteristic American high protective tariff. If they were given the opportunity again in the near future, they would mutilate the Dingley schedules a good deal, no doubt; but when they got through, there would remain an American protective tariff. Meanwhile, however, there would have been agitation and uncertainty, with the consequence that various important industries would curtail operations, and with harmful indirect effects extending throughout the business life of the country.

*Should the  
Tariff be  
Revised?*

Yet the present tariff is by no means the best that could be devised. The principal thing in its favor is the fact that business conditions have adjusted themselves to it, that the Treasury Department understands its qualities as a producer of revenue, and that the reasons for disturbing it are of a general nature rather than practical, specific, and immediately urgent. On the other hand, it is a simple fact that American industrial development has reached that condition of maturity to promote which the protective system was originally devised. We are becoming a great exporting nation, and foreign countries are growing more and more uneasy and disturbed over the invasion of their markets by American goods, while this country keeps up its high barriers against foreign commodities. Furthermore, some at least of our protected industries,—like tin plate, for example,—have passed under the control of a partial or almost complete monopoly; and in these cases, it is urged, tariff protection should be considerably reduced, if not altogether withdrawn. The fact is, that the American wage system is no longer dependent chiefly upon the tariff, but upon the efficiency of labor in actual

production. President McKinley, the great apostle of protection, had arrived at the opinion that the time had fully come for a modification of our policy. His last speech at Buffalo was a plea for enlarged commercial relations through a system of reciprocity treaties. Free trade with Cuba and the Philippines would be a good starting point, and reciprocity amounting practically to a zollverein, or commercial union, between the United States and Canada might prove to be an act of the most far-reaching statesmanship. A revision of the iron and steel schedules would not hurt this highly developed American industry, and the same thing might be said of several other schedules. Republican business men in almost every community of the country would like to see some conservative modification of the tariff, provided it could be done without political agitation and clamor, and provided certain members of the United States Senate would not take advantage of the rules of that body to prevent conclusions by interminable debate.

*Republican Opinion in the Northwest.* This feeling among Republicans was expressed very strongly in the Iowa State convention a month ago. The platform, as finally adopted, was the same one which had done service in the State campaign of 1901. There was, nevertheless, a good deal of opposition to it this year, led chiefly by the influential gentlemen who represent Iowa in Con-

gress. These men had naturally become imbued with the idea that, as a practical matter, any change of the tariff is a difficult thing to bring about, and with the further view—prevailing in conservative Republican circles at Washington—that present conditions do not justify a reopening of the tariff question. Governor Cummins, on

GOV. ALBERT B. CUMMINS, OF IOWA.

ON THE IOWA POLITICAL TURNPIKE.

**SPEAKER HENDERSON:** "Hi there! Clear the track! You're scaring my elephant!"

**GOV. CUMMINS:** "The elephant'll have to get used to it."

From the *Journal* (Minneapolis).

the other hand, supported by local opinion from almost every part of the State, held tenaciously to the view that if the tariff is not soon revised by Republicans in a cautious and friendly way, it will be revised by anti-protectionists in a hostile and radical way. Governor Cummins believes that, although it is only five years since the Dingley tariff was adopted, our industrial conditions have made greater changes in this period than in a preceding term of twenty years. The Iowa platform stands by "the historic policy of the Republican party in giving protection to home industries;" but it favors "such changes in the tariff from time to time as become advisable through the progress of our industries and their changing relations to the commerce of the world." The platform endorses the policy of reciprocity, and favors "any modification of the tariff schedules that may be required to prevent their affording shelter to monopoly." The Iowa Republicans do not mention any particular sched-

ules, nor set any time for action. It is well known that in Wisconsin and several other Northwestern States, there is much the same feeling as in Iowa in favor of conservative tariff revision. Many Republican newspapers throughout the country have commended the Iowa platform, although there seems very slight disposition on the part of any Republican leaders to come forward with more specific suggestions.

*The General Party Attitude.* Mr. Babcock, of Wisconsin, who is chairman of the Republican Congressional Committee in charge of this year's campaign, has heretofore been exceedingly active in an endeavor to reduce the tariff on articles which enter largely into our exports, or which are controlled in the domestic market by trusts or combinations of capital. But his position at present is one of general defense of the tariff system, as against Democratic attacks upon it led by Mr. Griggs, of Georgia, chairman of the Democratic campaign committee. The Secretary of the Treasury, Mr. Shaw of Iowa, while undoubtedly appreciating the fact that business conditions have grown quite away from the Dingley tariff, does not believe it worth while to agitate the subject now, because he sees no prospect of tariff revision until after the next Presidential election,--unless, indeed, the Republicans

HON. JOSEPH W. BABCOCK, OF WISCONSIN.  
(Chairman of the Congressional Republican Campaign Committee.)

HON. JAMES M. GRIGGS, OF GEORGIA.  
(Chairman of the Congressional Democratic Campaign Committee.)

should be taught quite emphatically in the Congressional elections this fall that the people demand an earlier revision. Undoubtedly, the position now held by such men as Mr. Payne, chairman of the Ways and Means Committee, Speaker Henderson, and Mr. Grosvenor of the House and Messrs. Hanna, Aldrich, and other influential leaders in the Senate, is that tariff revision ought not to be undertaken by the Congress to be elected this year, but ought to be deferred to its successor, to be chosen in the Presidential year 1904. The Congressional elections will be held under the new apportionment based upon the census of 1900. Under the new apportionment the total membership of the House will be 386, instead of 357, an increase of 29 members. The object of this change was to enable every State to keep at least its present representation. New York, Illinois, and Texas each gain three members, while Pennsylvania, New Jersey, and Minnesota gain two apiece. Fourteen States gain one member each, these States being scattered East, West, North, and South.

*The President and an Apportionment of Two.*

The White House at Washington has been undergoing extensive alterations and repairs, and President Roosevelt has spent as much as possible of the summer at his own permanent home at Oyster Bay,

Long Island. His plans comprise a twelve days' journey through the New England States, to end on September 3, and a visit to the West to attend soldiers' reunions, and for some other similar objects, beginning on September 19, and

JUSTICE HORACE GRAY, OF MASSACHUSETTS.  
(Retiring from the United States Supreme Court.)

continuing for two or three weeks. With Congress adjourned, and no very critical problems pending, either of domestic or foreign concern, it has been possible for high government officials, from the President and his cabinet down, to relax somewhat through the summer months. There have been no cabinet changes, and no rumors of any. The most important appointment of last month was that of Oliver Wendell Holmes, Chief Justice of the Supreme Court of Massachusetts, as a Justice of the Supreme Court of the United States, to succeed Justice Horace Gray. Several months ago Justice Gray, who is seventy-four years old, was stricken with apoplexy, and it was known that he would not again appear on the bench. Justice Holmes, his successor, has served for twenty years on the bench in Massachusetts, and is sixty-one years old. He is a man of brilliant and varied attainments, and an eminent legal scholar, of a thoroughly independent and modern order of mind. We present elsewhere in this number an interesting sketch of him from the pen of an esteemed contributor,

Mr. Morris. Justice Gray, who now retires, was also Chief Justice of the Supreme Court of Massachusetts when appointed twenty years ago. It has been known for some time that Justice Shiras intended soon to retire from the Supreme Court, and it was authoritatively stated last month that he would resign next spring, having attained the age of seventy years. It was also announced that, with the completion of his three-score and ten years, Dr. Andrew D. White would soon resign as ambassador at Berlin. While no formal announcement was made, it was commonly believed that the position at Berlin would be filled by the transfer thither of some other prominent member of the diplomatic service, those most frequently named being Mr. Charlemagne Tower, now ambassador at St. Petersburg, and Mr. Bellamy Storer, now minister to Spain and recently minister to Belgium. Dr. Andrew D. White is the best known and most conspicuous man in the American foreign service, and his retirement will be much regretted, although his return to the United States will doubtless result in his being drawn into various activities of a literary, educational, and philanthropic nature.

*Some  
Political  
Personalities.*

In the domain of political personalities the summer has brought forth little of special note or interest. It is to be said, however, that the emphatic voice of the country regarding the value of the services of Senator Spooner at Washington has had its due weight in Wisconsin. Spooner clubs have been forming all over the State. It is now practically certain that Mr. Spooner will be the Senatorial choice of the Republican members of the new Legislature, without any regard to those qualifications in its endorsement of him that the Republican State platform contains. It does not follow that Governor La Follette's strong support throughout the State has weakened in the least, or that the dominant element of Wisconsin Republicanism is any the less devoted to the projects of tax reform and nomination reform that are set forth in this year's platform; but it begins to see the impropriety of forcing local tests upon a Republican like Senator Spooner, whose duties at Washington have nothing to do with State issues at home. The perennial struggle about Addicks has broken forth with renewed vigor in Delaware, which remains without any representation at all in the United States Senate, through the stubbornness of the Addicks deadlock. The death of that silent but powerful Republican Senator, Mr. McMillan of Michigan, has made a vacancy for which the ex-Secretary of War, General Alger, was much

mentioned last month as a willing candidate. The Pennsylvania State campaign has brought Judge Pennypacker, the Republican candidate for governor, into much prominence, and he has been a good deal criticised by the more independent element of Pennsylvania Republicans for his unexpectedly warm and much reiterated eulogies of Senator Quay. It is asserted that this attitude on Judge Pennypacker's part may make votes for his Democratic opponent, ex-Governor Pattison. The Democrats of New York seemed as far as ever last month from agreement upon a candidate for governor. Determined efforts were on foot to reorganize Tammany Hall on an anti-Crocker basis. Mr. Bryan has continued to be the most prominent figure in national Democratic politics, and he has been making visits and public addresses in the East. He has declared plainly that he is not a candidate for renomination in 1904. He has not, on the other hand, said that he would decline a nomination which might come without any seeking on his part. Of Republican leaders, Senator Hanna remains the most conspicuous, apart from the President. If he reads the newspapers, he cannot possibly forget that he is regarded all over the country as a probable Republican nominee in case of conditions,—now improbable and unexpected,—which might take Mr. Roosevelt out of the field. Governor Crane, of Massachusetts, has been brought into added prominence through the report that he will be asked to manage the next national Republican campaign, Senator

Hanna, however, remaining as chairman of the National Committee. Apart from Mr. Bryan the most conspicuous and promising personalities in the Democratic field seem to be Mayor Tom L. Johnson, of Cleveland, Ohio, and Mr. Edward M. Shepard, of New York. It is entirely possible

GOV. ROBERT M. LA FOLLETTE, WISCONSIN.

THE LATE SENATOR JAMES M'MILLAN, OF MICHIGAN.

that Mr. Bryan might give the weight of his influence to either of these two men in 1904. Judge A. B. Parker, of New York, is another possibility

Mr. Johnson, by the way, now finds himself at the head of a city government whose charter has been found unconstitutional. A recent decision of the Supreme Court of Ohio has condemned and annulled the many enactments relating to the government of particular Ohio cities which have been in evasion of that clause of the State constitution which requires such legislation to be general rather than special in its application. I was necessary to deal with this situation in a special session of the Legislature; and this was accordingly called late in July by Governor Nash, to assemble at Columbus on August 25. Under the constitution it will be permissible to divide Ohio cities into regular groups or classes and it will be necessary to adopt a uniform general framework of government for all the cities.

*Ohio's City  
Charters.*

that belong in the same class. Ohio has thus an opportunity to benefit by the experience of the rest of the country in municipal government, and it is to be hoped that wise results may accrue from this special session. We believe that experience shows that a very large measure of home rule may well be accorded to the people of our American towns and cities, and that they ought not to be much hampered or restricted in carrying on their affairs and in spending their own money for local improvement. But, above all, it is to be hoped that the Ohio Legislature will be broad-minded enough to adopt such provisions as have been found in practice to aid in the lifting of municipal government out of the ruts of party politics. The National Municipal League, which has for some years past devoted much attention to the reform of municipal charters, and which has a number of influential members in Ohio, has been finding many newspapers of the Buckeye State friendly to its ideas. Its president is the distinguished leader of the bar, Mr. James C. Carter, of New York, and its secretary and executive officer is a well-known young Philadelphia lawyer and politician, Mr. Clinton Rogers Woodruff.

*American Municipal Progress.* Societies like this league, and like the League of American Municipalities (which is an organization of public officials), and the American Park and Outdoor Art Association (which includes in its membership several hundred park commissioners and superintendents, and which recently held a very brilliant annual meeting in Boston), are contributing a very great deal to the advancement of municipal government, and to the improvement and embellishment of our towns. One of the most beautiful and progressive of American municipalities has had the bad luck this year to fall into disgrace through its folly in electing a notoriously unfit man as its chief executive. We refer to Minneapolis, where indictments have followed astounding charges of malfeasance in office, and where the lesson will doubtless be taken to heart and remembered for many years to come. Now that the tendency in American cities is to concentrate authority more and more in the hands of the mayor and a group of department chiefs selected by him, it becomes indispensable that the mayor should be a man of judgment and poise as well as of the highest qualities of personal character. Thus it would be hard to overestimate the value that is accruing week by week to the great metropolis of New York, under its concentrated system of municipal government, from the efficient services of Mayor Seth Low and his appointed heads of the

various branches of the administration. High tone, business efficiency, genuine public spirit, and interest in municipal progress characterize not merely the mayor's office, but the work of nearly if not quite all of the numerous departments. New York is developing wonderfully, and Mayor Low's administration is contributing in a hundred valuable ways to the city's progress.

*Cuba's Troubles and Perils.*

The situation in Cuba continues to be one fraught with trials, difficulties, and dangers. It is hard to keep the sense of righteous indignation within moderate bounds when one remembers how clear and unmistakable was the moral obligation of Congress last winter to give tariff concessions to Cuba which would have obviated all the existing distress. It is not strange that the Cubans should feel bitterly disaffected toward this country. Nor is it unnatural that their disposition should be to disregard the terms of the Platt amendment as embodied in their constitution, or else to construe them as unfavorably toward this country as possible. In its serious financial plight the Cuban Government is proposing to try to raise a loan of \$35,000,000 in gold, the greater part of which is to be used to pay off the soldiers of the insurgent army, with a large slice to be loaned to planters and agriculturalists, to enable them to tide over the present disastrous season. This loan project is, of course, unfortunate, if not wholly ill advised; but it is hard to see in what other direction Cuba is to find relief. No man of any party ought to be elected to the Congress of the United States this fall who will not admit the duty of entering into a liberal reciprocity arrangement with Cuba, and will not promise to support such a policy. Meanwhile, the Cubans would do well to try to exercise patience, and keep their faith in the people of the United States, who, indeed, are distinctly with President Roosevelt in his Cuban policy, and as distinctly against the behavior of Congress in the last session. The Cuban authorities in particular will make a mistake if they disregard the obligations that they voluntarily assumed in adopting the Platt amendment. The lower house of the Cuban Congress, for instance, passed a resolution the other day repudiating an arrangement that Governor-General Wood had entered into with the Catholic Church authorities regarding compensation to the Church for certain property. If this resolution should be adopted by the upper house, and become effective, it would be not only in violation of the agreement entered into with the United States, but in defiance of the obligations assumed by the United States in the treaty of peace with Spain.

There would be no alternative for this country under such circumstances but to interfere, on the ground of its agreement with the government at Madrid.

*Problems of "Church and State."* The separation of Church and State, as understood in this country, does not signify antagonism toward ecclesiastical bodies, nor any disposition to confiscate their property. Those settlements arranged in Cuba were in good faith on the part of this government, and the Cubans would do well to accept them as honorable and just, and to study diligently the methods by which we secure to all churches freedom and contentment, while giving none of them a voice in the conduct of the state. The European governments and newspapers seem at a loss to understand the apparently delightful relations between the Government at Washington and the Vatican, in view of the pleasant things that have been said on both sides in connection with the visit of Governor Taft to Rome, the friendly exchange of greetings between President Roosevelt and the Pope, and the announcement that all difficulties in the Philippines are in the way of being settled. Europe continues to smile in an amused and superior way at the American statement to the effect that Governor Taft's mission was not a diplomatic one. They fail to understand because the explanation is so simple and easy, whereas they are looking for something more complicated. The United States has no controversy at all with the Vatican, with the Catholic authorities in the Philippines, or with the friars. It has no policy that would lead it to demand the exclusion of any class of men whatsoever from its jurisdiction, whether in the Philippines or in the United States. It had simply a business transaction or two on foot that could be better initiated at Rome than elsewhere. Its position in dealing with the land question was in some ways analogous to that of the British Government in its treatment of the land question in Ireland. Practical conditions made it necessary that the friars, who could no longer live in

From the *Independent*.

James F. Smith. William H. Taft. John B. Porter. Bishop Thomas O'Gorman.

GOVERNOR TAFT AND HIS ASSOCIATES IN THE MISSION TO THE VATICAN.

their parishes on account of the hostility of the people, should sell their lands. The civil government of the Philippines was the best and most responsible agency for negotiating the purchase and subsequently reselling to the actual occupants and cultivators.

*The Friars in the Philippines.* As to the withdrawal of the Spanish friars from the Philippines, there were reasons why on all accounts this was much to be desired. It was also evident, after conference at Rome, that it was neither necessary nor advisable that there should be any specified agreement on this point, but only a friendly understanding of the policy that would actuate the head of the Church. Since under the American rule no church establishment is possible, it is plain enough that the Catholic Church in the Philippines must as soon as possible be brought under the management of ecclesiastics accustomed to the American system; and we have the assurance of Archbishop Ireland and Bishop O'Gorman (who accompanied Judge Taft to Rome) that this is perfectly understood and agreed to at the Vatican. The completion of the negotiations will

M. FRANÇOIS COPPÉE, THE FRENCH AUTHOR, AND HIS COMPANIONS, PHOTOGRAPHED JUST BEFORE THEIR ARREST FOR THE PART THEY HAD TAKEN IN THE AGITATION AGAINST THE CLOSING OF THE RELIGIOUS FREE SCHOOLS. M. COPPÉE IS ON THE EXTREME LEFT.

be at Manila, where a papal delegate will represent the Vatican. The Spanish friars will have no further career in the Philippines, the friars' lands will be paid for honorably at a fair valuation, and religious associations will have neither more nor less position and authority in the Philippines than they have in the United States.

The position of the United States and its dependencies in the treatment of such questions seems a very fortunate one when compared with the agitation and strife into which other countries are plunged by complicated relations between governmental and ecclesiastical authorities. For example, two great European nations,—namely, France and England,—were last month principally absorbed with topics of this character. Hysterical excitement prevailed for a time in Paris, and later in more remote provinces of France, over the enforcement by the new ministry of the law relating to associations which was passed under the auspices of Premier Waldeck-Rousseau about a year ago. As explained to our readers at that time, this law was aimed at the existence in France of a great number of conventual establishments to which some 30,000 or 40,000 monks belonged and about 135,000 nuns. Some of the orders to

which these persons belonged were duly authorized by law and registered; but many others were not authorized, and there seemed to be many good reasons of public policy why such associations should all conform to the terms of some general law. It is a total mistake to assume that the new associations law contemplated the brutal expulsion of members of religious orders from France. To an American, its requirements would not seem unreasonable. The associations were asked to apply for registration, and, in doing so, to set forth what we should call the articles of agreement which held them together as a corporate body, and to meet further requirements of a general nature. Rather than meet these requirements, a number of religious orders withdrew altogether from French soil; some that remained have acted in disregard of the law.

The agitation last month was due to the closing by the government of the schools carried on by members of orders, mostly women, who had not complied with the law. To make such schools legal in France it is requisite that an application should be entered, and certain other formalities complied with. The closing of schools in some instances led to physical conflict, and there were

*The Schools  
and the Nuns.*

street demonstrations and no little violent haranguing. The semi-political agitation on behalf of the priesthood naturally led to anti clerical demonstrations on the part of the socialists and advocates of an extreme policy. The Vatican has observed silence throughout this struggle in France. Perhaps it is perceived in Rome that it would be better for the French Catholics in the long run if something like the American system could be worked out. The newspaper reports to the effect that the enforcement of the associations law was likely to lead to a revolution that would overthrow the republic are, of course, absurd. France is accustomed to the ministrations of the many scores of thousands of women who belong to the religious orders, and will not dispense with them. But there is no good reason why their schools should not be registered and authorized, and brought into some sort of conformity to required educational methods and standards. The government ought, however, to have been tactful and tolerant. Religious fanaticism is at least more excusable than fanaticism on behalf of so-called liberalism or secularism. It was not obligatory upon Premier Combes to close all the unlicensed schools carried on by nuns of the teaching orders, but merely permissive. Thousands of these very schools had already shown deference to the new law by entering their applications. It would have been more statesmanlike to avoid conflict by allowing ample time for the law to take effect.

While America has given remarkable evidences of late of its progressive spirit in educational matters, and while the French are resolutely working out a more modern school system on an educational rather than an ecclesiastical basis, England has presented the pitiable spectacle of a persistent attempt on the part of the present Tory government to break down the elective public school boards, and to drive the system of elementary education back under the control of the authorities of the Church of England. With a huge majority at its back in the House of Commons, the government has, however, been obliged to throw its educational bill over to the next session. The shattered Liberal party had gratefully discovered that the Tory government's slight tax upon imported grain, and its official determination to put the schools under ecclesiastical control, was providing a basis upon which the Liberals could come together again with conviction and enthusiasm. The effective Liberal opposition shown in the House of Commons debates, while calculated to retard somewhat the progress of the measure, was nothing as compared with the object lesson furnished in a special election to fill a vacant Parliamentary seat for the North Leeds district. This constituency had been Conservative by a very large majority; but when its member of the House was promoted to the peerage the other day, the Liberals seized the

*The Agitation  
in England.*

AN ORPHAN CLASS IN A ROMAN CATHOLIC FREE SCHOOL OF PARIS, SUPPRESSED LAST MONTH.

opportunity to carry the district very decisively upon the school question as the chief issue. It seems likely that if an appeal were taken to the country, the Liberals would return a majority to the House of Commons. Under these circumstances, Mr. Balfour allowed his educational bill to be postponed, and it may never become a law.

*Affairs in  
England.*

The coronation of King Edward, postponed from June 26 by reason of the King's illness, was duly carried out on Saturday, August 9, in Westminster Abbey, amidst surroundings of a highly spectacular nature, reminding most observers rather of theatrical pageants than of anything else that had come within the range of their own experience. The King bore the ordeal very well indeed, while the venerable Archbishop of Canterbury, who officiated in the ceremonies, seemed to have scarcely strength enough for his duties. Subsequently the King returned again to the royal yacht *Victoria and Albert*, off the coast of the Isle of Wight, for further recuperation. The arrival in Europe of prominent Boers aroused the utmost interest last month. Gen. Lucas Meyer and his wife were received with every courtesy in England. Going to the Continent, General Meyer unfortunately succumbed suddenly to an

EMPIRE AND PEACE.

(From a photograph taken in July.)

attack of illness, and died on August 8. Ex-President Steyn, of the Orange Free State, arrived early in August, too ill to proceed to London, and he was transferred at Southampton to a vessel which carried him directly to Holland. The most enthusiasm, however, was aroused by the arrival of Generals Botha, De Wet, and Delarey at Southampton, on August 16. They found that officialdom had made every arrangement for their reception, and that they were expected to be prominent figures at the great naval review following the coronation festivities. They declined, however, to witness the review, although accepting the King's invitation to visit him on board his yacht, where their Majesties received the distinguished South Africans with friendliness and tact. With the least possible delay these Boer leaders then proceeded to Holland. Their object in coming to Europe was to collect money for the reestablishment of the Boers on their farms. They contradict abso-

BOER PRISONERS ASSEMBLED IN CEYLON, JUST AFTER THE NOTIFICATION OF PEACE.

lutely the statements given out by the British Government as to the extent to which Boer farm property was devastated. The generals have stated that it is their intention to visit the United States before going back to Africa. There is not much news as to plans for the carrying out of the agreement to transport the Boer war prisoners back to their homes. Evidently the reconstruction period in South Africa must be one of a good deal of private suffering and public difficulty. The Boers must be loyal, and the British generous.

*The Unending South American Strife.* Until something very decisive occurs in the course of the civil combats that have been running along so obscurely in Venezuela and Colombia, it is not expected that the outside world will try to follow the meager and contradictory details of the marching, countermarching, and occasional fighting. Suffice it to say that during the last month General Matos, the leader of the revolutionary forces that were trying to overthrow the Castro government in Venezuela, was gaining ground, and was

likely in the near future to achieve complete success. Early in August he was said to have captured the important town of Barcelona, and to have invested Puerto Cabello, with the prospect of an early and successful termination of the campaign. In Colombia the fortunes of war seem to be going against the insurgents, and President Marroquin seems likely to suppress the uprising and to bring the situation under control. In that case, it will be with him that our Government will deal in concluding the final agreements about the Panama Canal. They have been having another revolution in Haiti, but the details are too trivial to be worth our space. It is to be noted, however, that the United States navy is on the ground nowadays to guard the interests of American citizens wherever disturbances occur in the West Indies or South America. Thus, we had several vessels last month off the coast of Venezuela, and a gunboat watching the situation in Haiti. The navy renders good service under these circumstances, and its growth and efficiency are matters of pride to the

PRESIDENT MARROQUIN OF COLOMBIA.

American people. The old question of the annexation of San Domingo and Haiti has been revived by the chronic inability of those ill-governed republics to maintain order, protect property, and develop the resources of the beautiful island that they share between them. From our own point of view, the acquisition seems scarcely desirable. A better bargain would be the outright purchase of the Isthmus before we spend Uncle Sam's money on a ship canal.

COMMANDER JOHN E. PILLSBURY.

(Who will have charge of the invading fleet in the war game.)

*Mimic War  
Game on the  
Atlantic Coast.*

Our navy had some new experience last month in the playing of the game of war off the coast of Long Island and New England. Rear-Admiral Higginson was in command of the maneuvers, with the battleship *Kearsarge* as his flagship. Operations began on August 20, and were to continue until September 6. From twenty to thirty vessels of the navy of all classes were engaged in sham actions, to test the efficiency of the coast defenses of Long Island Sound under various conditions. These so-called games had been thought out with the utmost care and scientific skill, and were undoubtedly destined to be of value both in the

REAR-ADMIRAL HIGGINSON.

(Commanding the fleet mobilized for the North Atlantic war game, August 20 to September 6.)

training of our naval and military forces, and also in the better understanding of all the problems involved in seaboard defense. The part that the army was to play in the work of coast defense was not so fully announced in advance. In fact, as to details great secrecy had been observed by the authorities both of the army and the navy. It was evident, however, by the middle of August that things were going to be done on a large scale, and in a very interesting way. The *Army and Navy Journal* declared, apropos

of the attempt at secrecy as to the objects and plans of the maneuvers of the forces engaged, that "scarcely less important than the test of the coast defenses of Long Island Sound is the question whether a series of maneuvers like those projected can be organized and executed without the discovery beforehand of their working plans. For that reason all details as to the proposed evolutions are sedulously guarded from the public, the purpose being to ascertain whether it is possible for an enemy, which will be virtually represented by the newspaper correspondents, to gather correct advance information as to the plans of the Government's operations under conditions like those which prevail in time of war. What may be counted on with reasonable certainty is that these evolutions will show splendid progress in the use of the search-light, signalling, including wireless telegraphy, naval scouting, and gun practice ashore and afloat."

**Coast-defense Problem.** As to the part that the army was to play under command of Major-General Mac Arthur, the *Army and Navy Journal* further remarked: "It is an open secret in military circles that these maneuvers will find the ordnance and artillery in a state of unpreparedness. When the preparations began, the

officers in charge had to deal with many discouraging conditions, including ungarrisoned posts, unfinished forts, incomplete armament, threatened delay in the delivery of supplies, and a demand for immediate modifications which it

Copyright, 1908, by G. G. Bain.

GEN. ARTHUR MAC ARTHUR.

(Commanding the land forces and fortresses involved in the maneuvers.)

GEN. LEONARD WOOD.

was originally intended to accomplish a year hence. These disheartening conditions have been largely overcome or will be before the date set for the maneuvers, but it will be only because of the most extraordinary and wearisome effort on the part of the officers in charge." If as one result of the maneuvers Congress should deal more liberally and intelligently with the coast-defense problem, this war game will have been played to good purpose. Naval maneuvers on a much larger scale are planned for the Caribbean Sea next winter. Meanwhile, in response to the invitation of the German Emperor, American officers have gone to attend the forthcoming maneuvers of the German army in East Prussia. President Roosevelt sent as our chief representatives, not to mention the junior officers who attended them, General Young, Adjutant-General Corbin, and General Wood. This invitation came as one of the re-

ADJUTANT-GENERAL HENRY C. CORBIN.

GEN. SAMUEL B. M. YOUNG.

(With Gen. Leonard Wood, these two high officers have sailed to witness the German army maneuvers. Our pictures show them in their new uniforms, just adopted by the United States War Department.)

sults of the American visit of Prince Henry. Another result has been the liberal distribution of German decorations among those in this country who were officially concerned with the reception and entertainment of the Prince.

*The World of  
Finance and  
Industry.*

The return of Mr. J. Pierpont Morgan to the United States from his summer sojourn in Europe, on August 20, was looked upon as a matter of greater interest and concern in the realm of actual affairs than the doings of European monarchs; while the reported serious breakdown of the health of Mr. Charles M. Schwab, president of the United States Steel Corporation, was seized upon by the press as a matter hardly less vitally important than the illness of the King of England a few weeks before. As for the great movements, national and international, in the business world, they have counted for more of late with practical men than the talk of alliances and combinations among the governments of the world. Certainly we are living in a period of industrialism such as could hardly have been imagined a generation ago. Mr. Morgan's return was expected to affect favorably several things of deep moment. Foremost among these was the protracted anthracite coal strike, which entered

upon its fifteenth week as Mr. Morgan landed in New York. The retail price of anthracite coal in New York on that date was \$9 a ton, but much higher rates were about to go into effect, with the wholesale prices advanced to \$10 and \$11 a ton, according to grade. Thousands of people were putting in gas ranges, and there was much uneasiness as to the winter's supply of fuel.

*As to the  
Coal Strike.*

Rioting and disorder at Shenandoah, Pa., became so violent toward the end of July that Governor Stone was obliged to order fifteen hundred State troops to the town, and military aid was also necessary for the preservation of order at several other points. Several lives, meanwhile, had been sacrificed in incidental conflicts, although in the main the strikers had conducted themselves with unexpected restraint. President Mitchell's powerful influence had been constantly exerted in behalf of the strict avoidance of lawbreaking and disorderly methods. Mr. Wilson, secretary-treasurer of the United Mine Workers, stated on August 20 that the funds for the maintenance of the strikers on the plan arranged at the Indianapolis convention were coming to hand in a satisfactory manner, and that the bituminous miners alone were contribut-

ing \$130,000 a week. It was somehow expected on all sides that Mr. Morgan, in view of his financial relations to the coal-carrying roads, might help to find a basis upon which the strike could be ended in September.

*As to Trusts and "Com-bines."* It was further hoped that Mr. Morgan would bring with him some definite news as to the organization of the great steamship combination that was pending under his leadership, but which had not yet assumed a corporate form. His arrival was simultaneous with reports from England to the effect that the much-talked-of project of a rival steamship service, to be heavily subsidized by the Canadian and English governments and to be administered by the Canadian Pacific Railroad, was not at all likely to materialize in the near future. Certain railroad amalgamations in the South were also said to be awaiting Mr. Morgan's coming. Mr. Schwab, whose indisposition had been much exaggerated by the newspapers, went abroad for a rest on the day following Mr. Morgan's return. The great iron and steel interests of the country,—so largely under control of the corporation of which Mr. Schwab is president,—continue to show unflagging prosperity; and it is as nearly certain as possible that they will be kept busy on a profitable basis for at least two years to come. The amalgamating tendency has had further illustration in the formation of a company which unites a number of the largest grain harvester concerns, with a capital of \$120,000,000, under the very appropriate presidency of Mr. Cyrus A. McCormick, of Chicago. On the day following the incorporation of this International Harvester Company there was an announcement of the incorporation, at Pierre, S. D., of the Farmers' National Exchange Company, with an authorized capital of \$50,000,000. It remains to be seen whether the farmers can advance their interests by attempting to enter on a large coöperative scale into the business of marketing their products.

*Foreign Affairs in General.* As to foreign affairs in general this past summer, there has been little of achievement or action, but floods of strenuous discussion. In England, for instance, Parliament adjourned on August 8, not to reassemble until October 16, with the declaration that the question of subsidies to British steamship lines was not ready for action, and that the pending education bill would also have to be postponed as unfinished business. The conference between the colonial department, under Mr. Chamberlain's lead, and the visiting premiers of the self-governing colonies also failed to accomplish the specific

results which much talk had led the world to believe were going to accrue. The conference ended on August 11. On the Continent, the Russian Government had started a world-wide discussion by suggesting to the other principal governments of Europe an international conference on the subject of trusts and industrial combinations. Nothing but talk is likely to result from this proposal. The powers do not take to the idea. The suggestion grew more particularly out of the action taken at the recent Brussels conference for the abolition of sugar bounties. There are, however, some very interesting problems of international trade arising from new commercial methods made possible by the American trusts and the great exporting syndicates of Germany; and M. de Witte's proposed conference is by no means so Quixotic as at first blush it may have seemed to some of the newspapers. While such a conference could not, under present conditions, result in practical agreements, it might greatly aid in the study of modern trade problems, and thus indirectly help to bring about solutions.

*The Ubiquitous Kaiser.* The activity of the German Kaiser has been unabated during the past summer, and he has been much at sea on board his royal yacht the *Hohenzollern*, and also on his dashing yacht the *Meteor*, which, while not very lucky in winning races, has, nevertheless, proved a satisfactory boat. Early in August, the Kaiser's maritime excursions brought him to the coast of Russia, where he hobnobbed with the Czar for two or three days, visited various Russian warships, and observed their maneuvers. A topic of anxious discussion in Germany last month was the proposed holding of the autumn army maneuvers in the province of Posen (the Polish part of Prussia), where disaffection has of late been so bitter. It was regarded in many quarters as a mistake of policy for the Emperor to march into Posen at the head of a hundred thousand troops, not to mention the considerable danger of attempts on his life. Late in August it was announced that the plans had been changed somewhat, and that the city of Frankfort-on-the-Oder would be made the Emperor's headquarters for the reviewing and the maneuvering of the troops. The visit of the King of Italy to Russia had continued last month to form a favorite topic of European discussion, as marking the growing friendliness between the great powers as grouped in the triple and dual alliances. There is constant talk of closer economic relations among the European states, to meet the increasing pressure of American competition. European wars grow more and more unlikely.

*In the  
Far East.*

In the far East there were no events of an exceptionally decisive nature, though it was reported that the fresh ascendancy of Japan in Korea had been seized as a pretext by the Russians for a postponement of the evacuation of Manchuria. There has never been any good reason to believe that the Russianization of Manchuria would be abandoned, although formal annexation might be indefinitely postponed. China comes duly forward with interest payments upon the war indemnity; has secured the evacuation of Tien-tsin by the powers; and seems to be introducing very considerable reforms. The Hon. John Barrett, who is in the far East on behalf of the St. Louis Exposition, is meeting with splendid success in persuading the Oriental nations to make large and attractive displays. The time is exceedingly favorable for a great growth of trade relations between the United States and the Orient, and the St. Louis fair ought to be made the means of adding immensely to the profitable traffic that follows the Pacific Ocean routes. The death of Mr. John W. Mackay has not thwarted or seri-

ously delayed the project of a cable line, to be laid by the company of which he was the chief promoter, from San Francisco to the Philippines and China, by way of Hawaii and Guam. The recent visit to the United States of Baron Shibuzawa, the leader in the commercial development of Japan, gives timeliness to a sketch of his career that appears in this number of the Review. Prince Henry is not the only scion of a royal family who has visited the United States in the year 1902. Last month, Prince Tsia Chen, a cousin of the Emperor of China, who had gone to England as special representative at the coronation, spent several days here on his way home. With him was the distinguished diplomat, Sir Liang Chen Tung, who is to succeed the genial and irrepressible Mr. Wu as Chinese Minister to the United States. He will not, however, enter upon his official duties here for several months. Our relations with China are now particularly favorable, thanks to the course that has been consistently pursued by our State Department during the last two or three years, and that has been appreciated.

SOME DISTINGUISHED CHINESE VISITORS IN NEW YORK LAST MONTH.

# RECORD OF CURRENT EVENTS.

(From July 31 to August 20, 1902.)

## POLITICS AND GOVERNMENT—AMERICAN.

July 31.—The Kansas Supreme Court issues a writ ousting the American Book Company from the State. .... President Roosevelt designates Col. R. M. O'Reilly as surgeon-general of the army. .... Maj.-Gen. John R. Brooke, U.S.A., is placed on the retired list; Major-General MacArthur takes command of the Department of the East.

July 22.—Governor Nash convenes the Ohio Legislature in extra session on August 25, to provide for the government of municipalities, the Supreme Court having declared existing laws unconstitutional.

GENERAL MATOS, THE VENEZUELAN REVOLUTIONIST.

July 23.—North Dakota Republicans renominate Gov. Frank White.

July 24.—Vermont Democrats nominate Felix McGettrick for governor.

July 30.—Iowa Republicans declare in favor of tariff revision, name President Roosevelt as a candidate to succeed himself in 1904, and commend the policy of reciprocity with Cuba.

July 31.—Michigan Democrats nominate George H. Durand, Gold Democrat, for governor.

August 1.—North Dakota Democrats nominate J. E. Crogan for governor.

August 2.—Hawaiian Republican primaries indicate a large increase in the party vote.

August 7.—Democratic candidates for judges of the

State Supreme Court and Court of Chancery Appeals are elected in Tennessee. .... Wyoming Democrats nominate George T. Beck for governor.

August 8.—President Roosevelt approves certain conditions attached by Attorney-General Knox to the proposal of the Pacific Commercial Cable Company for the construction of a Pacific cable.

August 11.—The retirement of Justice Horace Gray of the United States Supreme Court, is announced. President Roosevelt names as his successor Justice Oliver Wendell Holmes, of Massachusetts (see page 307).

August 12.—The California primaries result favorably for the regular Republican organization.

August 14.—Palmer S. Mosely defeats William L. Byrd for governor of the Chickasaw Nation, Indian Territory, by six votes.

## POLITICS AND GOVERNMENT—FOREIGN.

July 21.—The Sultan of Turkey appoints a commission to consider reforms in Macedonia.

July 23.—The Lord Chief Justice of England, Mr Justice Bigham, and Sir John Ardagh are appointed a royal commission to proceed to South Africa and inquire into sentences imposed by the British authorities under martial law. .... Sentences are pronounced on the officials of the Leipziger Bank, which failed in 1901.

July 25.—President Loubet of France signs a decree for the forcible seizure of additional Church schools under the Law of Associations; intense opposition to the government's policy continues to be manifested throughout the country. .... The Turkish commission authorized by the Sultan report on Macedonian reforms.

July 26.—The provisional government of Haiti declares General Firmin, the revolutionary leader, an outlaw.

July 29.—For the assassination of the Marquis de Mores, which took place in the Sudan in June, 1896, E. Kheir is condemned to death at Susa, near Tunis, and Hamma Chiekh is sentenced to twenty years' imprisonment; of 17 other Arabs accused of complicity in the crime, 6 are sentenced in default to be put to death and 11 to hard labor.

July 31.—The Spanish Minister of Finance issues a statement showing a serious deficiency in the national revenues. .... Lord Rosebery makes an important address to the Liberal League of Great Britain.

August 4.—The Cuban House passes a bill authorizing a loan of \$35,000,000, the minimum issue to be 90 per cent. and the maximum interest 5 per cent., redeemable in forty years.

August 5.—It is announced that the Firmin party in Haiti has formed a provisional government at Gonaïves. .... Premier Sagasta of Spain announces his desire to retire from public life.

August 7.—The British House of Commons, by a majority of 122, adopts clause 7 of the education bill, which gives the predominance in the management of voluntary schools to churchmen.

August 8.—Austen Chamberlain, son of the Colonial Secretary, becomes Postmaster-General of Great Britain, the Earl of Dudley Lord Lieutenant of Ireland, and Charles T. Ritchie Chancellor of the Exchequer (see page 297)....The British Parliament adjourns until October 16.

August 9.—King Edward VII. is crowned in Westminster Abbey.

August 11.—The conference of colonial premiers in London holds its final session, adopting a resolution in favor of the metric system of weights and measures.

August 12.—The city of Barcelona, Venezuela, is reported captured and sacked by the revolutionists, after a severe battle, in which 167 men were killed.

August 18.—Señor Emilio Terry offers his resignation as Cuban Secretary of Agriculture.

#### INTERNATIONAL RELATIONS.

July 26.—Diplomatic relations between Italy and Switzerland are resumed, through the mediation of Germany.

July 28.—As an act of courtesy to the United States, President Zelaya of Nicaragua commutes the death

THE MARCONI WIRELESS TELEGRAPH STATION AT GLACE BAY, CANADA.  
(Showing towers 215 feet in height.)

sentence imposed on Dr. Russell Wilson, of Ohio....The Spanish Cabinet Council discusses negotiations for a treaty of commerce with Cuba.

July 29.—The United States Government refuses to recognize the exclusive landing rights in the Philippines granted to cable companies by Spain....Great Britain withdraws all claim to sovereignty over the Bay Islands of Utila, Ruatan, Bonacca, or Guanaja, Felna, and Barbarat, acknowledging that they belong to Honduras.

August 1.—By agreement between Italy and Switzerland, important changes are made in the consular services of the two countries.

August 5.—The Hon. Andrew D. White, United States Ambassador to Germany, offers his resignation, to take effect on November 7 next.

August 11.—The treaties between Chile and the Argentine Republic, providing for arbitration and the limitation of armaments, are approved by the Chilean Congress by a large majority.

August 12.—A United States warship is ordered to Venezuela, at the request of Minister Bowen, to protect American interests.

August 15.—The city of Tientsin is transferred to the Chinese Government.

#### OTHER OCCURRENCES OF THE MONTH.

July 21.—Governor Taft has a farewell audience with the Pope....The excursion steamer *Primus* is cut down by a Hamburg-American tug in the Elbe; 50 persons are drowned.

THE KING OF ITALY ON HIS RECENT VISIT TO RUSSIA.  
(The King in the center, with the Czar at the left.)

July 22.—A monument to Gen. William H. T. Walker, a famous Confederate officer, is unveiled at Atlanta, Ga....The Pennsylvania Capitol Commission announces the selection of Edwin A. Abbey as mural painter and George Barnard as sculptor for the new capitol.

July 23.—By the capsizing of a Chinese steamer on the West River 200 persons are drowned.

July 24.—Judge Jackson, of the United States District Court, Northern District of West Virginia, sentences miners' agitators to prison for violation of an injunction.

July 26.—An alarming report is made by the Costa Rican commission appointed to investigate recent volcanic eruptions.

July 27.—Earthquake shocks do great damage in Santa Barbara County, Cal.

July 28.—An area 200 miles square in northern Nebraska, North and South Dakota, and northeastern Iowa is visited by an earthquake shock.

July 29.—Cardinal Gotti is chosen to succeed the late Cardinal Ledochowski as Prefect of the Propaganda at Rome.

July 30.—Troops are ordered out to quell the rioting of striking anthracite miners at Shenandoah, Pa.

July 31.—Earthquake shocks in California again cause destruction of property, especially in Santa Barbara County.

August 4.—The Italian Government orders the establishment of the Marconi system of wireless telegraphy on all its warships.

August 5.—The two hundred and fiftieth anniversary of the settlement of York, Maine, is celebrated.

August 12.—The International Harvester Company, with a capital of \$120,000,000, is incorporated at Trenton, N. J.

August 16.—The Boer generals, Botha, De Wet, and Delarey, are cordially received in England....King Edward reviewed the British Channel Fleet in Portsmouth Harbor.

August 18.—A volcanic eruption on the small island of Torishima, Japan, kills 150 people....The Moros on the island of Mindanao, P. I., begin active hostilities.

August 19.—The Boer generals arrive in Holland.

August 20.—The maneuvers of the United States navy off the New England coast are begun, the defense squadron, commanded by Admiral Higginson, starting from Rockport, Mass., on a search for the attacking cruisers *Prairie*, *Panther*, and *Supply*, under Commander Pillsbury.

#### OBITUARY.

July 21.—Gen. William H. Barnes, of San Francisco, Civil War veteran and a leading lawyer of the Pacific coast, 66.

July 22.—Archbishop Thomas W. Croke, of Cashel, Ireland, 78....Cardinal Ledochowski, Prefect of the Congregation of the Propaganda of the Roman Catholic Church, 80.

July 23.—Col. William H. Lockwood, a prominent citizen of South Carolina, 56....Frank Mulgrave Taylor, of Long Branch, N. J., journalist, 38....Royal E. Robbins, of Boston, founder of the American Waltham Watch Company, 78.

July 24.—Bishop Robert Woodward Barnwell, of the

Episcopal Diocese of Alabama, 53....Ex-Congressman Robert H. McClellan, of Galena, Ills., 79.

July 25.—Rev. T. C. Reed, president of Taylor University, Indiana, 56....Philip J. Markley, of New Britain, Conn., national advocate of the Knights of Columbus, 47.

July 26.—Dr. Charles Kendall Adams, former president of the University of Wisconsin, 67 (see page 310)....Prof. George Mann Richardson, of the faculty of Leland Stanford University, 38.

July 27.—Philip H. Kumler, a prominent attorney of Cincinnati, 65.

July 28.—Jehan Georges Vibert, French painter and author, 62....Rev. Dr. Stephen L. Baldwin, secretary of the Missionary Society of the Methodist Episcopal Church, 67....Chief Rabbi Jacob Joseph, head of the orthodox Jews in the United States, 62 (see page 311)....Ex-Judge Van R. Patterson, of the California Supreme Court, 54....Col. James B. Maynard, of Indianapolis formerly a prominent newspaper man of Indiana, 83.

July 29.—John W. Ross, of Washington, D. C., former Commissioner of the District of Columbia, 61....Rev. Charles E. Searle, master of Pembroke College Cambridge, 74.

July 31.—Rabbi Benjamin Szold, of Baltimore, 73.

August 1.—Mrs. Elizabeth Drew Barstow Stoddard poet and novelist, 79....Rt. Rev. F. Ulloa y Larios Roman Catholic Bishop of Nicaragua, 84.

August 2.—Alanson Trask, formerly a prominent business man of Brooklyn, N. Y., 94.

August 3.—Rev. William Bryant Brown, D.D., of East Orange, N. J., 86.

BOY SOLDIERS ENLISTED BY THE COLOMBIAN GOVERNMENT

Archbishop Croke.

Cardinal Ledochowski.

Archbishop Feehan.

## THREE ROMAN CATHOLIC PRELATES WHO HAVE RECENTLY DIED.

(Most Rev. Thomas W. Croke, who died on July 22, had been closely identified for nearly half a century with the Irish Nationalist cause. Cardinal Ledochowski, who died on the same day with Archbishop Croke, was Prefect of the Propaganda at Rome; he had been created cardinal by Pope Pius IX. Archbishop Patrick A. Feehan, who died on July 12, was the first ecclesiastic to preside over the archdiocese of Chicago.)

August 4.—Hendrik Willem Mesdag, the Dutch painter of sea scenes, 71....Commodore Joseph E. Montgomery, of the Confederate navy, 85....James F. Legate, a veteran Kansas politician, 72....Swami Vivekananda, organizer of the Vedanta movement in America, 86.

August 5.—President William M. Beardshear, of the Iowa State College, 52.

August 6.—Prof. John Jay Watson, violinist, composer, and musical director, 72....Sheriff Samuel F. Pearson, of Portland, Me., 61.

August 7.—Rudolph von Bennigsen, German Liberal statesman, 78.

August 8.—Gen. Lucas Meyer, of the Boer army.... John H. Twachtman, American landscape painter, 49....Col. John W. Taylor, veteran of the Civil War, 86.

August 9.—James J. J. Tissot, the French artist, 66.

August 10.—United States Senator James McMillan,

of Michigan, 64....Mrs. Eliza Young, the oldest actress in America, 90.

August 12.—Ex-Governor Lorrin A. Cooke, of Connecticut, 71....Dr. Martin Luther Holbrook, specialist in hygiene, 71....Ex-State Senator James Arkell, of New York, 72.

August 13.—Gen. Henry N. Hooper, veteran of the Civil War, 67.

August 15.—Luther R. Marsh, law partner of Daniel Webster, 89.

August 17.—George M. Hopkins, associate editor of the *Scientific American*, 60....William A. Hemphill, founder of the *Atlanta Constitution*, 60.

August 18.—Prof. Leopold Schenck, of Vienna, author of "The Determination of Sex," 62....Gen. Charles G. Loring, for many years director of the Boston Museum of Fine Arts, 74....Benjamin F. Guild, one of the editors and owners of the *Boston Commercial Bulletin*, 88.

## FORTHCOMING EVENTS.

THE following conventions have been announced for this month: National Convention of Employer and Employee, at Minneapolis, Minn., on September 22-26; International Conference on Hybridization and Plant Breeding, at New York, on September 30-October 2; Worcester County Musical Association annual musical festival, at Worcester, Mass., on September 22-27; National Baptist Convention (Colored), at Birmingham, Ala., on September 17-22; American Association of Obstetricians and Gynecologists, at Washington, D. C., on September 16-18; American Official Surgeons' Association, at Chicago, on September 8; Fifty-Year Jubilee of the Swedish Baptist Denomination of America, at Chicago, on September 21-28; American Dermatological Association, at Boston, on

September 18-20; National League of Veterans and Sons, at Saginaw, Mich., on September 10-11; American Veterinary Medical Association, at Minneapolis, Minn., on September 2-5; American Civic Improvement League, at St. Paul, Minn., on September 24-26; International Mining Congress, at Butte, Mont., on September 1-5; National Railway Transportation Association at Buffalo, on September 19; American Electro-Therapeutic Association, at Kaaterskill, N. Y., on September 2-4; American Electro-Chemical Society, at Niagara Falls, on September 15-17; Society of the Army of the Potomac, at Gettysburg, Pa., on September 19-20; National Prison Association, at Philadelphia, on September 13-18; United Typothetæ of America, at Pittsburg, Pa., on September 8-11.

## RECENT CARTOONS ON POLITICS AND BUSINESS.

**T**HERE is a pretty widespread opinion that the orthodox Republican leaders are quite too much disposed to treat the question of tariff revision as a purely "academic" one, to quote the word used by Secretary Shaw in his speeches last month in New England. This year's Republican campaign book glorifies the protective tariff in well-worn, old-fashioned phrases, but does not say anything about revision; and the word Reciprocity does not even occur in the index. It does, to be sure, print Mr. McKinley's last speech.

BLIND TO THE DAWNING SUN.—From the *Eagle* (Brooklyn, N. Y.).

**MR. W. J. BRYAN, A WELL-KNOWN POLITICIAN OF LINCOLN NEB., WISHES TO ANNOUNCE THAT THE "REPORTS OF HIS DEATH HAVE BEEN GREATLY EXAGGERATED."**

From the *Tribune* (Minneapolis).

We devote this page to four cartoons from the last month's work of Mr. Bowman, of the *Minneapolis Tribune*. They relate (1) to Mr. James J. Hill's recent friendly conferences with the farmers of the Northwest who are served by the great railroad systems that he dominates; (2) to Mr. Bryan's recent activity and prominence in political discussion; (3) to the remarka-

ble way in which Senator Spooner is looming up on the Wisconsin horizon, in spite of recent happenings; and (4) to the alleged discomfiture of the Democratic party because its rival has undertaken to appropriate the anti-trust issue as a part of its own stock in trade. Mr. Bowman's work is always humorous, and it usually shows political keenness, though strictly Republican.

THE THREE CARTOONS ABOVE SHOW LORD KITCHENER IN VARIED RÔLES.

ON THE MARCH TO WESTERN CANADA FROM CRAWFORD, NEBRASKA.

## MIGRATION TO THE CANADIAN NORTHWEST.

BY CY WARMAN.

**W**HY do they "trek"? This is a question which many of my fellow-countrymen in the United States are now asking with regard to the stream of emigrants from the Republic to the Dominion of Canada. But yesterday the stream flowed the other way, and the people of Canada trooped over to the United States, thousands of them, every year. They settled on our vacant lands, they entered our workshops, they competed with native-born citizens of the United States for positions of trust in store and warehouse, and they took places of eminence in the professions, notably law and medicine.

Now the trek is to the north; the "balance of trade" is with the Canadians. It is not through any antipathy to American institutions that these hardy sons of the soil,—for the emigrants are notably the best type of agriculturists,—go forth to take up new homes in the sparsely settled great land of the north. The outgoers are men and women who have nothing but the kindest regard for the Republic and republican institutions. Many, indeed, leave their old homes in the United States with regret. In that respect they do not resemble the vast body of our fellow citizens who have come from the Old World. These foreigners rejoice to throw off the shackles of militarism and the cramping tyranny of autocratic rule so prevalent in European nations and welcome the institutions of the United States, which are devised to insure freedom and fair play to every citizen. The person who leaves

the United States for Canada goes to a land equally free, if not more free, in all that affects the lives of ordinary individuals. From the Republic, indeed, the Canadians have borrowed without stint in forming their constitution. For the sake of convenience in commerce, they long ago imitated our system of decimal currency. They have followed our methods of local self-government, have their township and city councils, local legislature, and central system of government, just as the United States have; the chief and almost only difference being the executive, which, in Canada, as in Great Britain, is a responsible cabinet with ministers having seats in Parliament, and amenable to the representatives of the people as a whole, and not simply to the chief magistrate.

### THE UNDEVELOPED RICHES OF NORTHWEST CANADA.

Social and industrial reasons alone dictate the emigration. The desire of the emigrants is to better themselves. Within the past few years Canada has been discovered. She might have been discovered before, only the enterprising population to the south of the Dominion were too busy discovering the almost boundless resources of their own country, and bringing them into subjection, to permit of much time being devoted to their neighbors. Now, though there is yet, no doubt, much to do before it can be said of the United States that the opportunities for investing capital and employing labor are used up,

it is conceded that undeveloped Canada at present offers the best opportunity for the enterprising capitalist and the poor man willing to work. A hundred years ago the development of western Canada was begun. It was known to a select few that the territories lying between the Red River and the Rocky Mountains on the one hand, and the United States border and the Great Mackenzie River on the other, were marvelously fertile. But the handful of men who were cognizant of this fact were officers of the Hudson Bay and other great fur-trading companies, who had secured a monopoly of the land for the purposes of their industry, and who for generations had fostered the impression, which became world wide, that this enormous territory was a wilderness, cold, inhospitable, and unfit for the settlement of man, and only of use as a stamping ground for the fur-bearing animals.

Even as late as 1879 there were many who regarded the late James W. Taylor, United States consul at Winnipeg, as an extravagant, oversanguine dreamer, because he foreshadowed a great future for the northern Dominion, and pointed out that three-fourths of the wheat-growing area of North America "is north of the boundary line between the United States and Canada. There," he added, "the future bread supply of America, and of the Old World too, will be raised." But Mr. Taylor, now dead for a dozen years, is being vindicated. Canadians, slow to appreciate the great wealth that has been lying dormant within their borders, have now been aroused to the importance of the development of their country, and people of the United States, ever keen for the almighty dollar, are cheerfully joining in the development.

#### VAST AREAS OPEN TO SETTLEMENT.

The settlement of Canada's vast vacant lands is, nevertheless, barely begun. There are, it has been ascertained, in northwestern Ontario, in the province of Manitoba, and in the territories of Alberta, Assinaboia, and Saskatchewan, at least 200,000,000 acres of farm lands: over 250,000 square miles of habitable territory, of which probably seven-eighths are as yet unoccupied. The possibilities are great, the outlook captivating to an adventurous American. Take Manitoba as an object lesson. It has within its bounds 47,332,840 acres, of which 6,329,000 are lakes and 1,300,000 in timber reserves, leaving 25,000,000 acres of cultivable land. Though last year only 2,952,002 acres of this territory was under crop, so great was the yield of wheat, barley, oats, and other crops in the province and neighboring territories that the railways were blocked for months, and every available means of transit by land and water are yet busily engaged in carrying the products of the phenomenal harvests to the world's markets. The Canadian Pacific Railway, to head off similar prospective conditions this season, has just obtained power from Parliament to add \$20,000,000 to its capital stock, of which one-half will be devoted to purchasing rolling stock and the other to providing new lines. These great crops and bright prospects have given an impetus to railway building in Canada, and whereas the Dominion was until recently contented with but one transcontinental line, the construction of another is now being rushed, to run several hundred miles north of the Canadian Pacific Railway, and a company has been chartered, and has already begun the

building of a third overland line, which will open up the fertile lands of northern Quebec and Ontario, and pass to the Pacific Ocean through the rich plains of the Peace River region of northwestern Canada.

#### INDUCEMENTS TO THE AMERICAN FARMERS.

Now that land can no longer be had in the United States for the squatting on, and when even railroad lands bring big prices in the open market, the temptation which such a country as we have here described offers to the progressive American farmer is very

FARMERS DELIVERING GRAIN AT ELEVATORS.

great. If he has money, he can buy a good improved prairie farm in western Canada for very much less than his own holding will bring. If he has a wealth of grown boys, he can obtain free of cost to himself, and for every boy over eighteen years, a farm of 160 acres ready for the plough, and by united effort they can double their holdings by the yield of their labor in two or three years. This statement is not made at random. I have been over the territory, and have met with numerous instances of success in this regard. I knew a man who for a quarter of a century toiled on a stony, hard-to-work hundred acres in eastern Canada, and barely made enough to feed and educate his four sons and one daughter. He took the western fever, and settled west of Brandon, Manitoba, a few years ago. He sold his farm in Ontario, invested the money in adding 360 acres to his free grant of 160 acres; obtained 160 each for his three full-grown boys, and together they began to work this immense farm. The money borrowed at 10 per cent. to stock the place was all paid off in five years, and so well did the venture turn out that the daughter was sent to a ladies' college in Ontario to complete her education, and the boys, at the end of eight years, were able to take a trip to Europe. This is no exceptional picture of the successful prairie farming in Canada, and it accounts in some measure for the present rush to the northwest from all parts of the continent and from Europe. So the Yankee is trekking.

#### INFLUX OF AMERICAN CAPITAL.

Last year he crossed the border 20,000 strong. In the first four months of 1902 the number of emigrants from the United States was 11,480, and they brought with them to Canada over \$1,000,000 worth of property. As I write they are still pouring in, and it is expected that this year the number of new-comers from the United States will be more than double that of 1901. Nor are the emigrants from over the border entirely restricted to the farming population. All over the Dominion the enterprising "Yankee," as the people from the United States are called

A SOLID TRAIN-LOAD OF IMMIGRANTS FROM COTTONWOOD COUNTY, MINNESOTA, EN ROUTE TO THE RAILROAD HEADS AND RAILROAD POINTS IN WESTERN CANADA.

in Canada, is in evidence. He is a controlling power in the iron-mining and smelting in the maritime provinces. He is heavily interested in the Ontario factories and mines. The great nickel industry at Sudbury, Ontario, the largest and most profitable of its kind in the world, is under his control. He is everywhere in evidence in the mining region of northwestern Ontario, and at Sault Ste. Marie he has established great iron smelting, pulp, and paper manufacturing industries. He is measuring the north shore country like an army worm, hunting for iron ore. In the far-off Yukon he is cool of-the-walk as a miner and speculator. He owns Canadian railroads, and wherever he goes he puts new life and energy into the community. In the awakening of the "Sleeping Empire of the North" the American sees his opportunity, for already great deals for the control of land granted to railroad and other corporations have been arranged. Purchases have been made within the last few days of millions of acres of choice lands, and more are in negotiation, the speculators having in view in many instances the early settlement of the property by immigrants from the United States. These big holdings are relics of the old régime of speculation and railroad land bonuses, which are no longer in vogue. The government that has held power in Canada for six years came into office with a pledge to hold the public lands for the settler, and not for the speculator. They have kept their promises, and land cannot now be obtained from the govern-

ment except by bona-fide settlers, who do not get a deed until they build a house, cultivate some of their land, and remain in possession several years.

#### WHAT THE SETTLERS FIND.

Far-sighted Americans who desire to get hold of land for speculative purposes have therefore to deal with those who obtained big grants in the early days. Even that description of land has gone up in price. Within the last year the Canadian Pacific Railway Company, which has 16,000,000 acres of choice territory under its control, raised the price of much of it from \$3 to \$5 an acre, but this has not prevented the company from more than doubling its land sales in the last six months. At the present rate ten years will not have elapsed before all of its vast land grant, — larger than the whole of cultivated Ontario, — has been disposed of, and probably well settled. The Yankees cross a boundary line which is largely imaginary, and find a vast country with abundance of the very best grain-growing, cattle-raising, butter-and-cheese-making land for the taking up, if government territory, and for a mere song if the property of others. They find a land with a bracing, health-promoting climate, — cold at seasons it is true,

but just as enjoyable as to climatic conditions as the tier of States along its southern border, and withal conducing to longevity. With men, indeed, it is as with animals and cereals, the farther north they can be raised in comfort the better the quality, the more robust they are. Then, the fuel question has been solved, even for the Canadian prairie settlers. West of the Red River and east of the Rockies there is much wood, and where it is not easily obtainable there is plenty of coal. Over 65,000 square miles of coal lands, much of them under government control, are known to exist in the area named. New-comers from the United States find, too, that Canada is a country with institutions like our own, and with perfect security to life and property everywhere. Let me note that \$40,000 was spent by the Canadian authorities in tracking and bringing to justice a murderer who waylaid and killed two citizens of the United States who were coming out of the Yukon territory. It was a large sum, but when some one in Parliament asked the Minister of Justice for an explanation of it he said it was well spent, and would be spent again under like circumstances, for the Canadian Government was determined that life and property should be protected.

CUTTING WHEAT NEAR GRISWOLD, MANITOBA.

# THE POLITICAL SITUATION IN ENGLAND AFTER SALISBURY.

BY W. T. STEAD.

**L**ORD SALISBURY'S disappearance has been received with extraordinary nonchalance by the British public. The passing of Lord Palmerston, Lord Beaconsfield, and Mr. Gladstone created a very deep and sincere emotion. Lord Salisbury's resignation, although he has been longer prime minister than any other Englishman of our time, has hardly produced a ripple in the stagnant waters of English political life. Mr. Labouchere's cynical phrase, that it was to him a matter of absolute indifference whether the uncle

or the nephew was head of the government, represents not unfairly the general impression. The spirit of apathy or indifference is probably due to two causes: first, that Lord Salisbury was in the House of Lords, not in the House of Commons and although he ceases to be prime minister, he remains in the House of Lords. He has quitte the cabinet, it is true, but the cabinet is a body which does its work in secret. Its proceedings are never chronicled, and Lord Salisbury has concealed rather than advertised the important part which he has played as prime minister.

The second cause goes deeper. The storm emotions generated by the war have left a certain flaccidity in the nervous system of the British public. A drum upon which Mars has been thumping with all his might for three years naturally makes little response to the gentle tapping of political incident. An eminent Indian scientist is publishing a book this autumn in which he demonstrates by a series of admirable ingenious experiments the existence of what he calls "response in metals." He has discovered that what have hitherto been regarded as inanimate substances, such as iron and steel, are capable of response to influences to which they have hitherto been considered impervious. They can be made sick, for instance, with poison, and reduced to a condition of apparent death, from which they can be resuscitated or resurrected by the administration of antidotes. If metals are thus capable of response, it would be wrong to despair of a nation, even although for the moment it seems to be drugged into lethargy by the combined influence of material prosperity and war.

Whatever may be the cause, there is no mistaking the fact that Mr. Balfour's succession to the premiership has occasioned less stir than many political incidents of much less importance. Mr. Gladstone lived ever in the public eye. Week days and Sundays he was always doing or saying something which afforded material for newspaper comment. The public took the keenest interest in his books, in his porcelain, in his cutting down trees at Hawarden, in his reading the services at the parish church. He was a performer always in the glare of the footlights, whether in office or out of it. Lord

A RECENT PICTURE OF LORD SALISBURY.

Salisbury lived in comparative seclusion. If he did not direct the affairs of a world-wide empire from a hermitage, he governed it from Hatfield, and often for weeks together he would never leave his retreat, even for the purpose of meeting the diplomatic representatives of other powers at the Foreign Office. The Cecils are a world unto themselves, and if Lord Salisbury may not be exactly said to be one of those world-forgetting mortals by the world forgot, he lived and lives apart. Of late years his memory failed him, not for facts so much as for faces, and all manner of odd stories are current as to the mistakes which he made owing to his inability to distinguish between individuals. On one occasion a worthy wine merchant, who was invited to spend a week-end in a family party at Hatfield, is said to have been mistaken by the late prime minister for Lord Roberts. The delusion was so complete that, after opening the conversation at the dinner table, he carried his astonished guest off into the library, and insisted upon learning from his uninstructed lips exactly what he thought of the campaign in Africa. "Tell me," so the story goes,—“tell me,” he said to the flattered but bewildered wine merchant, “what you really think of the war in South Africa. Will Lord Kitchener make as great a mess of it as all our other generals?”

The good man rose to the situation, and was rewarded by being anxiously asked by the prime minister what he would do if he were in South Africa at that moment. It was not until the following day that the guest was aware of the reason for the strange solicitude which the prime minister had shown for his opinion upon military tactics.

On another occasion he is said to have asked who that remarkably intelligent young man was with whom he had just been transacting business. “It is one of your private secretaries,” was the reply. When a man forgets the face of a private secretary, and confounds wine merchants with commanders in chief, it is not surprising that he should find the time had come for his departure.

This, however, was probably accelerated by the difference with the King. Edward VII., when Prince of Wales, was never held in much regard by Lord Salisbury. There was a marked contrast in this respect,—which the prince was quick to appreciate and resent,—between the manner in which he was kept in the dark by Lord Salisbury and carefully informed of all that was going on by Mr. Gladstone. Rumor has it that the late prime minister deemed it his duty on at least one occasion formally to remonstrate with the King on matters which His Maj-

esty did not consider came within the scope of ministerial surveillance, and the difference is said to have culminated when the King insisted upon making an entirely different list of coronation honors from that which had been prepared for his acceptance by his ministers. Whatever truth there may be in these stories, the fact is that Lord Salisbury tendered his resignation on the first day on which the King could receive him after his operation. Something must have happened. Otherwise Lord Salisbury could hardly have quitted the stage on the very eve of the coronation.

So marked was the estrangement that Lord Salisbury fixed the day of his departure for France before the coronation. He was probably induced to remain over the ceremony by consideration of the scandal which his absence would have occasioned.

He has the satisfaction of seeing his nephew installed in the premiership, and leaving his party with an assured majority in both houses of Parliament. The one danger-point was the risk that Mr. Chamberlain might have asserted his own claims to the premiership. This was successfully averted, and Mr. Balfour entered upon his new functions with the formal and public benediction of his own possible rival. Mr. Chamberlain's claims were never strongly put forward, not even by himself. There are many reasons why it was impossible for him to have succeeded. The first was the fact that by universal consent he could not lead the House of Commons. The gifts requisite for managing that deliberative assembly are often possessed by persons with much less of character and debating ability than Mr. Chamberlain; but successfully to lead the House of Commons it is necessary to be a gentleman in the true sense of that much-abused word. This has nothing whatever to do with ordinary gentility. There were few more successful leaders of the House of Commons than Mr. W. H. Smith, who began life as a newsboy, and who ended it as a millionaire news agent. But by consent, even of his own friends, Mr. Chamberlain would be an impossible leader of the House. Even if he had possessed all the gifts and graces of Mr. Balfour, he would still have been impossible for another reason. Although in many respects he is more Tory than the Tories, he is nevertheless not a Tory by profession, but a Liberal Unionist. The Conservatives, who enormously outnumber the Liberal Unionists, acquiesce in the Duke of Devonshire's leadership in the House of Lords, but they would have resented it if the leadership in both houses had been vested in Liberal Unionist hands.

A third reason was the fact that Mr. Chamberlain as Colonial Secretary has plunged the empire into difficulties out of which it is his duty to extricate it—if he can. The difficulties are only beginning to be appreciated by Mr. Chamberlain. He allowed Lord Milner to bring on the war, believing all the while that President Krüger would never fight; and he has just now experienced as great, although not so conspicuous, a reverse in the collapse of his high-flying schemes for converting the colonies into a highly organized military empire. As in one case he reckoned without President Krüger, so in the other he reckoned without Sir Wilfrid Laurier and Sir Edmund Barton. Hence he may well feel reluctant to surrender the control of colonial politics to any other hands than his own. Had he become leader of the House, he would have undertaken a task for which he was not competent, excited jealousies within the party which might have rent it in twain, and he would besides have had to hand over the control of the South African settlement to new and possibly unsympathetic hands.

The moment it was known that Mr. Chamberlain supported the premiership of Mr. Balfour public interest in the crisis evaporated. It was only partially revived by the announcement of the approaching retirement of Sir Michael Hicks-Beach. "Black Michael," as he is called, is a long-legged Wiltshire squire, who, although Conservative by tradition, has never shown any sympathy with the heresies of his own party, which, for the most part, are nothing more than reversions to the primitive Tory faith. In nothing is this more conspicuous than in his dislike of Jingoism and his devotion to free trade. It is true that, although a man of peace, he consented to the war; and although a free-trader, he consented to the imposition of the corn tax. Nevertheless, no one—not even his worst enemies—accused him of doing either one or the other excepting by an act of violence to his own convictions. Between him and Mr. Chamberlain there has been very little love lost. The story goes that in the summer of 1899, before the outbreak of war, Black Michael observed grimly to one of his associates that he could not help feeling profound sympathy for President Krüger,—seeing that he had so much to do with Mr. Chamberlain. During the war time, once and again, it was announced that he was on the point of resigning; but like the lady who swore she would never consent, and consented, Sir Michael, while always swearing he would resign, never quitted office. He has not yet even abandoned the post of Chancellor of the Exchequer, and it is quite on the cards he may continue in office from the sheer inability of Mr. Balfour to find a presentable successor. There

RT. HON. CHARLES T. RITCHIE, THE NEW CHANCELLOR OF THE EXCHEQUER.

has been some talk of putting Mr. Chamberlain in his place; but, apart from Mr. Chamberlain's reluctance to leave the Colonial Office, there is very little to tempt him in the succession to an office whose occupant must provide the expenditure of the war. According to the latest estimate of the Chancellor of the Exchequer, the war has cost Great Britain £228,000,000, of which only £75,000,000 have been paid out of taxation. The rest, £153,000,000, has been added to the national debt.

The news has just come that Mr. Ritchie, who has made a passable Home Secretary, is to be the new Chancellor of the Exchequer. He is a plain man of business, not much of an orator, who is probably the best man available for the post. His place at the Home Office will be filled, so it is said, by Mr. Akers Douglas, the present First Commissioner of Works. Mr. Akers Douglas has been very successful at the Board of Works, but now much of his success was due to his permanent under-secretary, Lord Esher, and how much was due to his own initiative, is a doubtful point. Lord Esher will not accompany him to the Home Office.

The next change to be announced was the resignation of the Viceroy of Ireland, Lord Cadogan, a wealthy ground landlord of Chelsea. He had the one indispensable qualification for an Irish viceroy—he had money to burn. He has kept up semi-regal state at Dublin Castle, without giving any particular offense or making any par-

MR. AUSTEN CHAMBERLAIN, THE NEW POSTMASTER-GENERAL.

ticular mark. Although he represented Ireland in the cabinet, the real work of representation has always been done by his chief secretary, who has a seat in the House of Commons, and who will probably in the new administration have also a seat in the cabinet. Mr. George Wyndham, the present holder of the chief secretaryship, is a charming personage, who began political life as Mr. Balfour's private secretary, and who acquired some of the easy nonchalance of his chief. He is a man of letters and of wealth. He served with distinction at the War Office, but as chief secretary he can hardly be said to have distinguished himself. He meant well, but the permanent forces of reaction were too strong for him. It is possible he may be transferred to another post.

As the premiership remains in the hands of the Hotel Cecil, it was necessary to strengthen the representation of the Chamberlains in the

cabinet. Mr. Austen Chamberlain, who has displayed good business-like capacity as Financial Secretary to the Treasury, has been appointed Postmaster-General, with a seat in the cabinet.

Mr. Austen Chamberlain will have an opportunity of showing what can be done by the British post office in promoting the extension of British trade, and of facilitating intercommunication between the ocean-severed members of the English-speaking race. If he would but take up and carry out the programme of Mr. Henneker Heaton, he would render good service to the community. Lord Londonderry, his predecessor, has resigned on promotion, but at the moment of writing his new post has not been announced. He might return to Dublin Castle, but the viceroyship is said to be promised to Lord Dudley.

Another resigning minister is Lord James, of Hereford, who made his mark as Sir Henry James, but who has done little or nothing since he was raised to the peerage. He is seventy-four years of age and a Liberal Unionist. He vacated the Chancellorship of the Duchy of Lancaster, which is filled by Mr. W. H. Walrond, who for some years has been chief whip of the Unionist ministry. With the exception of Lord James, the other elder men cling to their posts.

The cabinet is still overladen and unwieldy. But cabinet ministers, especially when they are over seventy, shrink from resignation, which appears to them almost as the countersigning of their own death warrant. Lord Halsbury, the Lord Chancellor, who is seventy-seven on Sep-

tember 3, and Lord Ashbourne, who is sixty four, the Irish Chancellor whose name lives in connection with the Ashbourne Act, the first measure passed for the purpose of enabling the Irish peasant to convert himself into a proprietor by the aid of state credit, are both mentioned in the newspapers as seniors whose places might well be left vacant or filled by younger and more energetic men.

The colonial conference, which was intended to crown the edifice of Mr. Cham-

THE EARL OF CADOGAN AS LORD LIEUTENANT OF IRELAND.

berlain's ambition, has brought about the utter destruction of his ambitious schemes. As the proceedings of the colonial conference are private, very few people even in England are aware of the extent to which his hopes have been blighted. He had built a showy house of cards, and the colonial premiers have blown upon it, and the cards are now all lying in a shapeless heap on the ground. The chief credit for this remarkable achievement belongs to Sir Wilfrid Laurier, the Prime Minister of Canada.

When Mr. Chamberlain summoned the colonial premiers to London, it was with the object of securing their assent to a great scheme of Imperial military and naval organization, which would have bound all parts of the empire together in a *kriegsverein*. The *zollverein* idea had been abandoned as hopeless, and an Imperial Council in London was soon seen to be out of the question; but they pinned all their hopes upon the *kriegsverein*. Now, the First Lord of the Admiralty and the Secretary of State for War duly submitted their schemes to the colonial conference, only to have them rejected without ceremony. As Americans have some not unnatural alarm as to the possible consequences of the new departure which was taken when the Canadian contingents were dispatched to the seat of war in South Africa, it will be eminently reassuring to them to know that the attempt to use this as a precedent, or to construct upon it an obligation, has been peremptorily rejected by the representative of Canada. Sir Wilfrid Laurier has been resolute from first to last not to enter into any undertaking that would in any way involve Canada in the vortex of militarism, or, to use the phrase which he employed while speaking to me, in the military system of the Old World. Canada reserved her right, just as if she was an independent sovereign international state, to decide whether or not she will take part in the wars of the empire, or whether she will stand aloof; and Sir Wilfrid Laurier shows himself as zealous against involving the New World in the quarrels of the Old as if he had been a thoroughgoing advocate of the Monroe Doctrine.

With Sir Wilfred Laurier stood Sir Edmund Barton, the representative of the commonwealth of Australia, and the opposition of these two men paralyzed the rampant Jingoism of Mr. Chamberlain. He is endeavoring to put as good a face upon it as possible, but his more candid supporters do not conceal their chagrin. The *kriegsverein* is dead, and Sir Wilfrid Laurier has killed it.

Only one of the colonial premiers, Mr. Seddon, of New Zealand, showed any disposition to support Mr. Chamberlain in his project of convert-

LORD HALSBURY, LORD CHANCELLOR.

ing the loosely knit alliance of independent commonwealths into a fighting empire, and Mr. Seddon to-day is a disappointed and disillusioned man. So much disappointed is he that it is probable he will only return to New Zealand for the purpose of abandoning his premiership, and of transferring his energies from the political to the financial world. Mr. Seddon, in short, is going to quit New Zealand politics, and take to money-making in Johannesburg. So passes away Mr. Chamberlain's dream.

Another remarkable fact which will not fail to be appreciated abroad, is the extraordinary popularity of the Boer generals. Gen. Lucas Meyer, whose sudden death in the Hague was announced in August, had never had such a good time in his life as he had in the last week. He had been fighting England for the last two and a half years, and on his arrival he was simply lionized,—not by the pro-Boers, but by the representatives of the government. He was banqueted and entertained in town, and has been an honored guest in the country house of at least one peer and member of the ministry. He lunched with Mr. Chamberlain, and, *mirabile dictu*, the King invited him to Sandringham if

he returned to England after his cure at Carlsbad. Alas! that visit will never be paid.

Gen. Lucas Meyer, it may be said, was always in favor of peace, and opposed the war, although he bore himself gallantly enough in the fighting. But it was arranged that when Generals Botha, Delarey, and De Wet arrived at Southampton, they should be accorded a royal reception. At the Cape they had been received with an enthusiasm which knew no bounds; and it seemed that in England they would be welcomed quite as heartily as by the Dutch.

Mr. Steyn, the heroic president of the Free State, who also arrived from South Africa in August, was conveyed direct to Holland, without tarrying on British soil. This was due solely to the state of his health. He also would have been welcomed with enthusiasm, but he is paralyzed in his limbs, and it was thought dangerous to subject him to the double railway journey from Southampton to London, and from London to Harwich, to say nothing of the driving across London. Mr. Fischer came over from Holland to meet his President. It was the first visit he had paid to England since the war. In talking to him about the compensation for private property which had been destroyed, under the plea of the necessity of war in the republics, he made a very acute suggestion.

"Your ministers," he said, "have officially declared that only 680 farms have been burnt in South Africa before the decree was issued that farm burning had to be stopped. Since then they declared that only a very few farms have been destroyed. Suppose that we take it that the very few is 120. In that case, according to the official information given to the world, only 800 farms will have been destroyed. We are quite willing to waive all claim for compensation for these 800 farms, which are the only farms officially admitted to be destroyed, if, in return, you will rebuild and restock all the farms which an investigation will prove have been really destroyed by your troops in South Africa."

Mr. Albert Cartwright, the editor of the *South African News*, is returning to Africa to resume the editorship of the paper, which had ceased to appear on the declaration of martial law in Cape Town. Mr. Cartwright and Dr. Jameson are traveling to South Africa on the same ship, together with Mr. Alfred Beit, who, since Mr. Rhodes' death, may

be regarded as the leading representative of the South African financial magnates. When they reach Cape Town they will find that, owing to the inexcusable folly of Lord Milner in promoting an agitation for the suspension of the constitution, Sir Gordon Sprigg, the Cape premier, will be at the head of a strong parliamentary majority, chiefly composed of members of the Afrikaner Bund. Therefore, if you add to all these facts the evidence afforded by the North Leeds election, where a Tory majority of 2,500

EX-PRESIDENT STEYN LANDING AT SOUTHAMPTON.

was converted into a Liberal majority by 758, and the secession of Mr. Wason, who is the member for the Orkney and Shetland group, and who has publicly repudiated the party he was elected to support, and has thrown in his lot with the Liberals, you can understand some of the reasons why the Liberals are beginning at last to believe that the star of Chamberlain is waning, and that in a very short time the British public will have regained its equilibrium.

# BARON YEIICHI SHIBUZAWA, THE CREATOR OF INDUSTRIAL JAPAN.

BY STANHOPE SAMS.

**T**HERE visited this country in June and July the master-builder of the present commercial and industrial splendor of Japan, Baron Yeichi Shibuzawa.

The Japan we know to-day is less than half a century old. Students of art and of literature know a much more ancient country; but the rival of America and England in the commercial conquest of the East, who sends her ships into every port, and her trade commissioners into every nook and cranny of the globe, was created by the present generation. Thirty-five years ago, when Japan had been thoroughly aroused, when the Shogunate and feudalism had been shattered, and when the young "Mikado,"—half-god, half-man,—had been brought triumphantly by the forces of progress from the seclusion of the temple, and made all man, and Emperor, and leader of his people, the patriotic minds of the nation saw visions of future greatness and magnificence. While many dreamed of military and political glory, Yeichi Shibuzawa saw a power and greatness born of peace. He saw that the future held for his country the greatest opportunity ever offered to a people that were conscious of it and able to grasp it.

The moment that Baron Shibuzawa landed on our shores, the press hailed him as the "John Pierpont Morgan of Japan." This characterization, which contains only the usual half-truth of the newspaper, is at least suggestive. The truth is that while Baron Shibuzawa's present position in Japan somewhat resembles that of Mr. Morgan in the United States, inasmuch as each is the greatest business organizer and leader in his own country, the careers of the two men present a remarkable contrast. They chose widely separated paths, and the aim of the Japanese was far different from that of the American. Mr. Morgan chose business as a career; Baron Shibuzawa chose it as the best means for promoting the welfare of his country. The great American financier has contributed largely, but indirectly, to the prosperity and advancement of his country; the great Japanese financier has contributed even more largely, and directly, to the prosperity and advancement of Japan. In the one case, the benefit to the country was an incident; in the other, it was the high and governing purpose.

It is only in Japan, among the countries of the modern world, that a career so varied as Baron Shibuzawa's is possible. Born in 1840, in Musashi province, the province of Tokyo, as a youth he attached himself to the powerful "clan" of Lord Hitotsubashi, of the great Tokugawa family. In this service his creative and organizing genius found a splendid field. He established a new and effective military system, and reorganized the unsettled finances of the clan. These reforms led to the advancement of the Hitotsubashi. Lord Keiki became Shogun, and Shibuzawa was made an officer of the government. After a visit to France, in 1867-68, to study Western civilization,—during which "the Restoration" was effected at home,—he was appointed tax controller of the Financial Department of the new Imperial Government. He rose rapidly, becoming successively assistant Vice-Minister, Junior Vice-Minister, and Vice-Minister of Finance. Unquestionably, the highest positions in the gift of the Emperor were within his grasp. Suddenly, he gave up this brilliant life. Its splendid prizes no longer lured his ambition. He saw a new light. Not military glory, but solid prosperity, wealth, civilization, and culture are the real foundation of a nation's greatness.

## AN INDUSTRIAL ORGANIZER.

Though trained to arms and statecraft, he abandoned a high career, and began to realize his vision of a new Japan. He planned, he labored, he organized. He won the confidence of all, and was acknowledged as a leader in an industrial revolution whose consequences were to be far more important than were those of the "Restoration," the most luminous hour in Japanese history. It is largely due to his directing and masterful genius, which embraces all fields of industry, that to-day the industrial and commercial development of Japan is the wonder of the world; that highways of steel are laid between her great cities; that the exquisite products of her craftsmen are known in every household of the West; that her merchant fleets cover the Pacific and Indian oceans; and that her people have been brought abreast of modern culture and civilization, and are prosperous and happy. X

was largely due to him that Japan deliberately set aside dreams of military glory, and chose the sober triumphs of peace.

"I realized," said the baron, in speaking to the writer of the hour when he decided to break with tradition,—*"I realized that the real force of progress lay in actual business, not in politics, and that the business element was really the most influential for the advancement of the country, so I gave up my political position and devoted my life to business, in which I have continued until to-day. I soon came to the conclusion that the capital of an individual was not enough to accomplish very much, and I then became the means of introducing the company system into Japan. The idea was successful, and the government approved it. Since then I may say that every industry in the country has increased,—some twenty times, some ten times, and none less than five times."*

Baron Shibuzawa shows in his bearing and conversation the manner in which he won his great successes. While sitting, he seems to be about the average height of Americans; but standing, it is seen that he is much shorter. He is, indeed, about five feet and one inch in height,—the stature, by the way, of so many prominent Japanese that it is commonly said of them that they belong to the *"Five-and-one Club."* The baron's erect and confident bearing, however, creates a distinct and flattering illusion as to his height.

His head, large and fully rounded, and his broad, athletic shoulders, of leonine structure and suppleness,—the legacy of his Samurai training,—really constitute the man. His face, which in a photograph does not seem very foreign, is highly characteristic of the best type of Japanese manhood. It is wide and full, and crowned by a broad, liberal, overtopping brow. His eyes are small but piercingly keen, though soft and expressive in conversation. For there seems to be in all things Japanese,—whether it is art, or man, a flower-picture, or the face of a hero, or of a strong master of trade,—something essentially feminine and tender, which softens and adds an indefinable and elusive charm to all ruggedness of form and character. The baron meets all men as equals. There is no hauteur or stiffness, and he talks without the palpable reserve so common and so disagreeable in men who have fought their way through difficulties. One may clearly see here the sincere complaisance that wins the good will and confidence of others, and which must have counted for much in the baron's vast enterprises, where many clashing interests had to be brought into harmony and coöperation.

It was while he was still an imperial minister,

thirty years ago, that he undertook the tremendous task of organizing the industrial life of a nation of 40,000,000 people. In this day, when the great captain of industry and the successful merchant and manufacturer are honored members of the highest social orders, it should not be forgotten that in Baron Shibuzawa's day, in Japan, to enter the class of merchant and manufacturer was to lose *"caste,"* and to forfeit all social rank. The man of affairs was despised. But the ardent reformer in turn despised all such distinctions as empty, unjust, and dishonoring to the nation. He made the sacrifice, became a merchant, and sank to the level of a lower caste. Then he proudly uplifted that caste, by his own deeds and by the deeds he inspired in others, until its members were called into the Emperor's Council Chamber, and Mutsu-hito, wisest ruler in the world to-day, felt honored in making them lords and peers of his realm.

#### JAPANESE SHIPBUILDING.

His first work of organization was naturally in the field of shipbuilding. Japan, an island empire, must have merchant fleets. Her old life had been confined within her own shores; but now the sea was to her what it had been to Phenicia and England. Let us see what she has accomplished.

When Baron Shibuzawa started the shipbuilding industry in Japan, there were no vessels to carry the Japanese merchant flag, save a lot of worthless junks. A few small ships had been bought in Europe, but there was no shipbuilding, no native dockyards. By 1890, 586 steam and 865 sailing vessels, a total of 1,451, and nearly every one home-built, bore the flag of Japan. More shipbuilding and dock companies were organized, and splendid vessels were constructed, at a rate unequaled perhaps, in the annals of shipbuilding. By 1900 there were 1,321 steam and 3,850 sailing vessels, a total of 5,171, or an increase of 3,720 ships in ten years, or nearly 400 per cent. Such were the magnificent results in a single field of his genius for organization.

#### BANKING AND FINANCE.

His next step was to organize the banking and financial system of Japan. This, he saw from the beginning, was necessary, as without organized capital there could be no organized industry. At that time there was not a bank in the Japanese empire. In 1873, he organized the first Japanese national bank, now known throughout the financial world as the Dai Ichi Gingo, literally *"Number One Bank."* Of this present institution he still remains president.

**BARON YEIICHI SHIBUZAWA.**

It was in the early days of his business career that Baron Shibuzawa felt the lack of trained men of affairs in Japan. A well-trained body of workers was as essential as organized capital. And so he founded a commercial school at Tsukiji, which has long been a famous institution, and from which have come many of the ablest business men and financiers of the empire.

His visit to France in 1867-68 gave him an opportunity to study the peculiarly modern and western method of organizing the business of a city as shown in boards of trade and chambers of commerce. The plan of a chamber of commerce at Tokyo, the new capital and business metropolis of the empire, was its immediate re-

sult, and he was able to carry this plan into effect in 1878. No sooner was the Tokyo Chamber of Commerce organized in that year than other cities, stirred into new life by the great events of the time, began to emulate the business enterprise of the capital, and a hundred and more commercial bodies were formed.

Preceding by many years the master stroke of Mr. Morgan in forming a great "shipping combination," Baron Shibuzawa combined his own original steamship company with its rival, the Kyodo Unyu Kwaisha, and again merged both these lines, together with others, into the Nippon Yusen Kwaisha, one of the largest and most splendidly equipped steamship companies in the world.

## RAILROAD-BUILDING.

The railway, as the only means of developing the interior of the country, soon engaged his attention. This, at first, demanded too vast an outlay of money for a nation of farmers and fishermen with little hoarded wealth, and even when it was introduced the government made the deplorable mistake of adopting, presumably for economic reasons, the "narrow gauge" system, which has hopelessly complicated and trammelled railway development ever since. The government constructed the line between Tokyo and Yokohama, 18 miles long, in 1872; and a private line, 63 miles long, was built in 1883.

Baron Shibuzawa devoted much time, attention, and money to extending the railway system so that it would furnish an artery from the capital to every important city in the main island, or Hondo. The development was rapid in both the government and private system. In 1890, the government lines were 551 miles in length, and private lines 896 miles,—a total of 1,447 miles. In 1900, the government lines had grown to 1,010 miles, and private lines to 2,905 miles,—a total of 3,915 miles.

In 1890, the income of the government railway lines was 4,213,804 yen, the profits being 2,212,531 yen; while the private lines had an income of 4,360,478 yen, with profits of 2,793,801 yen. In 1900, the government lines had an income of 15,920,385 yen, with profits of 8,819,277 yen; while the private lines had an income of 31,059,696 yen, with profits of 15,662,243 yen. Baron Shibuzawa is now president of four railway systems.

These are only a few of his great projects that have made or are the history of modern Japan. These enterprises extend over the thirty-five years of Meiji,—the official designation of the reign of the present Emperor,—and stretch on into the future, when they will serve as foundations of Japan's commercial empire in Formosa, China, and Korea. For to his initiative and tireless persistence is due the construction of the Seoul-Chemulpo and the Seoul-Fusan railways in Korea, and the organization of banking and industrial associations in Formosa, Korea, and China.

## ACTIVE IN ONE HUNDRED AND FIFTY CORPORATIONS.

Perhaps no other organizer has ever been engaged in so many and various enterprises. The lay mind is confused and dazzled by such multiplicity of details. A Japanese admirer has counted and tabulated the organizations and companies of which the baron is either the head or the guiding spirit. They number some one hun-

dred and fifty concerns, and include every kind of business that Japanese industrial and commercial life has evolved, every manifestation of civic and national interest in the development of the country, and every form of charity and philanthropy.

One of the chief factors of Baron Shibuzawa's success is his clearness of vision. He is never blinded by illusions. He believes that the time will come when Japan can measure stride, in a commercial and industrial sense, with the greatest of her rivals,—America, England, and Germany,—but that time is not yet. If others had understood as well as he the limitations of Japan, the country would not have been plunged into that reckless investment of capital which followed the successful war with China, and which so terribly crippled the national resources. His counsel of caution was not heeded, and for several years the nation faced bankruptcy because of its very prosperity. It had sunk its capital in investments that were certain to pay big dividends in two, three, or four years; but in the meanwhile it would have to go borrowing, or starve in the midst of its immobile wealth. All this Baron Shibuzawa foresaw, but could not prevent. In the sharp competition with nations of the West, he also clearly recognizes the limitations of Japan.

"The time will come," he said to the writer, "when Japan will be able to compete with the countries that have long occupied the field, in all lines of manufactured goods, but this time must necessarily be distant. The trouble at present is that while the Japanese can imitate everything, they cannot yet invent superior things."

It was the American's ability "to invent superior things" that drew him to the United States. European civilization and industrial life he had studied at the commencement of his own business career. It has hardly advanced since then. The new life of industry was to be found in the United States. Here he would see that inventiveness and resourcefulness which is conquering the world of trade. He came, and found it more wonderful than he had imagined. The whirl of machinery, the roar of our great maelstrom cities, bewildered him.

"What in America has impressed you most?" I asked.

"The substitution of the machine for the man," he replied.

In recognition of his great services to the nation the Emperor has made him a baron and a peer of the realm,—the first time in Japanese history that such a dignity has been bestowed upon a private man of business.

# OLIVER WENDELL HOLMES, JURIST.

BY GEORGE PERRY MORRIS.

**O**LIVER WENDELL HOLMES, the doctor and poet, was short in stature and had a jaunty air befitting so mirthful and witty a man. Oliver Wendell Holmes, 2d, present Chief Justice of the Supreme Judicial Court of the Commonwealth of Massachusetts, and appointed by President Roosevelt to be Mr. Justice Gray's successor on the bench of the Federal Supreme Court, is tall in stature and gaunt and solemn, albeit not without much of his father's wit and humor, but far more strenuous a worker and liver than his father was, and less optimistic and more of a stoic. The strenuosity of his professional life, the stern grappling not only with the facts of this but the mysteries of the next world, and the constant struggle of a not over-strong physical frame to carry the burdens imposed by an insatiably hungry intellect, an imperious will, and tender heart, have left their marks on face and form.

As the son of a man who was both physician and poet, scientist and man of letters, Chief Justice Holmes,—for such he must be called still, until in rising he takes the simpler title of "justice" again,—reveals in all he says or writes that he has both the poet's amplitude of feeling and love for and use of symbolism, and the scientist's reverence for truth and facts, his method of ascertaining truth, and his stern joy in accepting it when found, be it ever so disillusionizing. Sometimes the poet in him is ascendant; at others the rationalistic scientist; at all times he has the art of stating his thought in a way that justifies the opinion that he is a facile, brilliant prose stylist.

Like the Higginsons, — H. L. and T. W.,—Robert

Gould Shaw, Charles Russell Lowell, and so many others of the flower of Massachusetts' intellectual and social aristocracy, young Holmes went from Harvard's classic halls in 1861 to fight for his country in the Civil War, and he returned a hero, having been thrice wounded, and having been brevetted major, lieutenant-colonel, and colonel in turn for gallant and meritorious action in the battles of Ball's Bluff, Antietam, and Chancellorsville.

The experiences of this portion of his life have so interpenetrated his being that his judicial decisions, his after-dinner speeches, his eulogies of

CHIEF JUSTICE OLIVER WENDELL HOLMES, OF MASSACHUSETTS.

(Appointed by President Roosevelt to succeed Justice Gray in the United States Supreme Court.)

departed friends, his conversation at the club, are all both adorned and illuminated by martial figures of speech and ideals of a soldier's sense of duty and honor. Indeed, so much does the idea possess him that the soldier's proffer of self for country is of all acts the noblest, that in a passage of singular impressiveness and poignancy, in which he reveals his general agnosticism as to the meaning of the universe and his fear lest all life be illusion, he adds this one fact of which he *is* sure,—namely, “that the faith is true and adorable which leads a soldier to throw away his life in obedience to blindly accepted duty, in a cause which he little understands, in a plan of campaign of which he has no notion, under tactics of which he does not see the use.”

Like all gallant gentlemen soldiers, young Holmes had while fighting, and now has, sincere respect for his foes—for their honor and for their bravery. “The soldiers of the Civil War,” he says, “need no explanations; they can join in commemorating a soldier's death with feelings not different in kind, whether he fell toward them or by their side.” Indeed, it is expressly to the “noble enemies” in Virginia, Georgia, and on the Mississippi that he credits his learning a philosophy of life thirty and more years ago, which he still holds, and which may perhaps be quoted as expressing his point of view of human life as well as anything which could be cited, although it lacks some of the negations and questionings of characteristic *obiter dicta*, which also might well be quoted were there space.

In the strife with Southerners during the Civil War he says that he learned :

That the joy of life is living, is to put all one's powers as far as they will go; that the measure of power is obstacles overcome; to ride boldly at what is in front of you, be it fence or enemy; to pray, not for comfort, but for combat; to keep the soldier's faith against the doubts of civil life, more besetting and harder to overcome than all the misgivings of the battlefield, and to remember that duty is not to be proved in the evil day, but then to be obeyed unquestioning; to love glory more than the temptations of wallowing ease, but to know that one's final judge is one's self.

Feeling thus toward the Southern soldier and the cause for which he fought, the South need have no fear that cases coming before the Supreme Court for adjudication in which the Southern point of view is involved will not have a fair hearing. Grant was more of a friend to the South than Stanton the administrator or Sumner the legislator, and Kitchener has done more to make racial unity possible in South Africa than Milner. So Holmes, who fought the South, will judge the South better than Hoar, who knew it only from afar.

In describing the sensations of a soldier's life, Chief Justice Holmes has the gripping, realistic power which Stephen Crane strove after, but with the advantage over Crane of having undergone what he describes; and as one reads the brief, vivid, unforgettable word-pictures of his military career, which Chief Justice Holmes has again and again painted for the benefit of veterans of the Grand Army, or for youths at Harvard, or for disciples in the law, one cannot but wish that he might have found time from his professional toil to have painted on a larger canvas, in the form of fiction, a story of the Civil War, in which his rare powers as an analyst and as a stylist might have found opportunity for full expression.

A man whom “Fate's dark opacity” has made a calm awaiter of personal Destiny.—as much so as ever Omar the Persian or Marcus Aurelius the Roman were,—and a man to whom the martial virtues are the highest, and a jurist who believes that “the present has a right to govern itself so far as it can,” and to whom “historic continuity with the past is not a duty. it is only a necessity,” is not likely to balk at the word Destiny when applied to national policy, or to draw back from a course of action for the nation which involves possible war, or to be over-much obedient to past interpretations of the Constitution, if it seems to be necessary to adjust judicial decision to the present need, as interpreted by popular vote or by legislative decree. It is natural that there should be speculation as to what course Justice Holmes will follow, after he ascends the Supreme Court bench, in passing upon the military, diplomatic, and legislative history of the nation since 1898, so far as it is amenable to judicial interpretation. One does not need to know how far he was “sounded” by the President ere the appointment was made to be quite certain that he will not prove reactionary or obstructive.

President Roosevelt himself is not a more confirmed advocate of the strenuous life than Chief Justice Holmes. Both his own thrilling joy in the struggle of the Civil War, the passion of which still seems to him most glorious, and his domination by the scientific temper of his day, lead him to say that “the struggle for life is the order of the world, at which it is vain to repine. . . . Sooner or later we shall fall; but meantime it is for us to fix our eyes upon the point to be stormed, and to get there if we can. . . . We need it (strife or war) everywhere and at all times, for high and dangerous action teaches us to believe as right beyond dispute things for which our doubting minds are slow to find words of proof. Out of heroism grows faith in the

worth of heroism. The proof comes later, and even may never come. Therefore I rejoice at every dangerous sport which I see pursued." It is for uttering such sentiments as these to Harvard students on patriotic holidays that Chief Justice Holmes, along with President Roosevelt and Senator Lodge, has incurred the ban of the coterie of the academic circle, which deprecates extolment of the martial virtues or emphasis on athletics.

Of course no man born, bred, and educated as Chief Justice Holmes has been could or would undervalue the intellectual side of life; and he will bring to the Supreme bench not only capacity for prodigious industry, but learning, brilliant penetration, still more striking gifts of expression, a theory of law "which draws its postulates and its justification from science," and a knowledge of anthropology, economics, penology, and allied themes which few, if any, judges now on the bench possess. But neither his intellectual attainments nor his occasional exaltation of intellect above feeling can obscure the fact that he is fundamentally a man of feeling. Life for him is forever being seen and defined in terms of passion and action, not of reason and contemplation. A bench full of such judges would be dangerous; a bench adorned and supplemented by one such may somehow seem less distant and superhuman and coldly abstract than it often seems to be now. When human sympathy, a stern sense of duty, moral courage to run counter to precedent, and to declare the feelings and hopes of men are joined in one person with intense hunger for facts, the ideal of science in formulating generalizations, long experience,—Chief Justice Holmes ascended the bench in 1882,—and a very vivid, realistic, human way of formulating opinions, then a judge of exceptional quality is at hand. And such a one is the subject of this sketch. The masses are quite right in feeling that his judicial opinions on the Massachusetts bench have shown him to be one who will conserve the rights of man as well as those of property; and if it be the policy of the administration to use the powers of the executive department to curb the undue power of vast aggregations of property, it is most fortunate that the federal judiciary in its highest court is about to be reinforced by one who has remained a democrat amid surroundings making for distrust and contempt of the masses.

That Justice Holmes will now and then, in the future as in the past, say audacious, unconven-

tional words is to be expected. The man who can tell Harvard alumni and undergraduates assembled in Memorial Hall that all that Harvard did in the Civil War was "to send a few gentlemen into the field who died there becomingly," or who can tell graduates of the Law School assembled in honor of Prof. C. C. Langdell that none of them can deny that half the criminal law does more harm than good, and who, at the Supreme Judicial Court of Massachusetts' ceremony in honor of John Marshall, ventured to intimate that Marshall's work as a judge proved nothing more than that he was "a strong intellect" and had "a good style, personal ascendancy in his court, courage, justice, and the conviction of his party,"—such a man may now and then disturb conventional circles in Washington, whether legal or political.

While intensely American in the best sense, Chief Justice Holmes is a cosmopolite in his his reading, in personal acquaintance, in his sympathies, and in his ideals as a jurist. For his own as well as for his father's sake, he has been taken into European circles which few American jurists have penetrated. He knows Continental literatures. He is alive to Italian pioneer investigation in jurisprudence based on science.

Socially he will adorn the cosmopolitan society of the national capital. And in the sacred confines of the court room, whether when under public scrutiny or when the justices are "by themselves," he will not be found lacking in that father-wit which so often goes along with the judicial temperament. Of the five requisites of success in the calling to which he has given so much of his life, as defined by the late Justice Joseph P. Bradley of the United States Supreme Court,—moral sense, brains, learning, tact, and experience,—Chief Justice Holmes has at least four strongly marked. In addition, he has what Chief Justice Bradley said must be added to natural aptitude,—viz., "power of intense and persistent labor." That he is a Papinian, a Cujas, a Coke, a Hale, a Mansfield, a Blackstone, a Marshall,—in short, a genius such as arises now and then to put talent to shame and dazzle the legal profession, none of his most ardent admirers in Massachusetts will claim. Nor will those who question most the wholeness of his vision as judge fail to pay homage to the insight of his partial views, or the moral courage and lofty purposes of the man.

## THE LATE DR. CHARLES KENDALL ADAMS.

**D**R. CHARLES KENDALL ADAMS, who died several weeks ago, was identified successively with three great American universities in important formative periods. He was the Nestor of modern advanced historical teaching in this country; and as head of the department of history and political science in the University of Michigan, his reputation was both national and international. Upon the retirement of Dr. Andrew D. White from the presidency of Cornell University, Dr. Adams was made the head of that institution, where he showed broad capacity for university administration during his seven

years' incumbency. Upon giving up that position he became the president of the University of Wisconsin, about ten years ago. Under his administration the institution at Madison has become one of the foremost universities of the world. The part that Dr. Adams took in the advancement of historical research in this country, and his share in the making of three universities, will have given his name an abiding place in the record of our intellectual progress. By the terms of his will, his estate will ultimately go to the University of Wisconsin for the endowment of fifteen fellowships.

# THE LATE RABBI JOSEPH, HEBREW PATRIARCH OF NEW YORK.

BY ABRAHAM CAHAN.

THE death of Chief Rabbi Jacob Joseph was the culmination of a long period of illness which had completely incapacitated him for public life. For several years he had been confined to bed with paralysis, so that the designation of chief rabbi had come to represent an idea rather than the occupant of the lofty rabbinical office which was created with the arrival of the celebrated Talmudist in this country.

When the sad news was told by the six Yiddish dailies published in New York's "East Side," the largest Ghetto in the world awoke to the fact that it had once had a *rav-hakolel* (chief rabbi) who was easily the greatest Talmudic scholar America had ever seen, and that that *rav-hakolel* was no more. His portraits, which had not been seen in the streets for six or seven years, had suddenly made their appearance in every store-window,—heavily draped in mourning.

A sigh of sorrow and of something akin to remorse went up from the Ghetto.

The orthodox old people were blaming the high pressure of life in their adopted country for having led them to become reconciled to their rabbi's untimely retirement from activity, as though

Copyright, 1912, by Isidor Vog, New York.

THE LATE CHIEF RABBI JACOB JOSEPH, OF NEW YORK.

anxious to make up for it by feeling in one day all the anguish that should have been experienced during the six years of his physical helplessness. As to the younger sons and daughters of Israel, who had fallen in with the spirit of their time and their new surroundings, they were aroused to a keen sense of the tragedy of the rabbi's

life and death amid an unwonted environment.

"He was too good for America?" exclaimed men with gray side-locks and women in heavy wigs.

"Poor learned man! He was out of his element in a modern town like this," said those who had tasted "Gentile wisdom."

And both generations lamented him as a martyr, as the victim of changed conditions.

On the morning of the funeral hundreds of stores were closed in honor of the deceased "son of Law." Thousands of poor mechanics, laborers, peddlers, and pushcartmen forewent a day's earnings to swell the hosts of mourners. Every street on the lower East Side was streaming with people, hurrying and scurrying in the direction of Henry Street and Montgomery, where lay the remains of the great scholar.

"I hope it isn't yet too late to get near the rabbi's house," they whispered to each other, with solemn mien.

"I hope it isn't. To think that the chief rabbi—the memory of the righteous for a blessing!—is no more! I can hardly bring myself to believe it."

"We were not worthy of such a man of learning and piety. It's for our sins in this strange land that we have been punished. May he plead for poor Israel before the court of Heaven."

By 10 o'clock the pavements, sidewalks, stoops, fire escapes, and open windows were literally jammed with people. At a distance it almost looked as though not the streets below, but also the walls of the towering tenement houses were covered with men, women, and children. Newsboys were singing the names of the Yiddish papers as they pushed and jostled their way through the throng. Here and there a venerable-looking man, with dangling ear-locks and dragging beard, was telling the people around him of the erudition and acumen for which Rabbi Joseph had acquired fame throughout Lithuania, and how scarce men of his type were becoming in Israel; whereupon the old women nodded their bewigged heads and sighed, while the men asked questions and drew comparisons.

The body was washed and clad in death-clothes, a shroud, and a praying shawl. Then it was placed in a plain wooden coffin.

When the procession was started the three hundred boys from the religious schools of Manhattan and Brooklyn, who preceded the hearse, burst into song. They were chanting selections from psalms, and as their lugubrious soprano voices rang out, accompanied by the doleful jingle of charity boxes, many a woman broke into sobs.

The funeral proceeded to six of the largest

synagogues on the East Side, in each of which brief services were held while the hearse waited in front of the house of God. There were fully 50,000 mourners in the crowd which followed the coffin as far as the ferry,—the largest Jewish procession of its kind ever held on American soil.

Rabbi Jacob Joseph was born in 1840, of a family of poor old-fashioned Jews,—in the town of Kraus, province of Kovno. He was surrounded by a world in which the Gentile population was in the firm grip of mediævalism, and in which Talmudic lore was the only source of intellectual life known to Israel.

There are no places of amusement in a Ghetto of this kind. Playhouses are proscribed by the Talmud. Balls or dancing schools, like those which teem on the east side of New York, are unimaginable. If there is a public garden in Tavrigh, you may find it crowded with Jews of a Saturday afternoon; but if it ever was at the time Rabbi Joseph was a boy there, the sexes were kept carefully apart. The very notion of a man and his wife taking a walk together, like a Gentile couple, would have shocked the sense of decency of every God-fearing Jew in the place. The synagogue, ringing with the voices of scholars, was at once the clubhouse and the university, the theater and the house of prayer. "A brainy piece of Talmud is far more delicious than a fat piece of meat," say the pious old people of Tavrigh.

At the period in question boys of the class to which belonged the future chief rabbi of New York never studied any of the "Gentile subjects" taught in the government schools. Their whole time was occupied by the *cheder*, where they spent from ten to twelve hours a day learning the Old Testament under the instruction of a bewhiskered man called *melamed*. Learning to read and to write Russian or German,—any language, in fact, except Yiddish Hebrew and the mixed Chaldaic and Hebrew of the Talmud—would have been looked upon as something in the nature of a sin, as well as an unpardonable waste of time.

Already while at *cheder* Jacob attracted considerable attention by his unusual reasoning powers and memory. At the age of sixteen he entered the celebrated Talmudic academy at Walojin, in the province of Wilna. Here he was at once singled out as the most promising student in the place, as a future "great one in Israel." It was here that he was surnamed Yankele Harif, or Jacob the keen-witted.

He married in a suburb of Kovno, and, according to the custom of those days, he left his bride soon after the wedding to pass a year or two in holy study, away from the effeminating

influences of home. This was the only kind of wedding tour known to the world in which he had grown up, and the young scholar spent this time studying the Talmud under the guidance of Rabbi Israel, of Salant, perhaps the ablest Talmudist of his time.

Armed with a diploma from the famous scholar, Jacob, shortly after rejoining his wife, accepted a rabbinical position, at first at Valon, and then at a larger town. His fame as a "keen head" spread far and wide, so that by the time he was a man of forty or more he was invited to become the "town-preacher" of Wilna, known as the Jerusalem of the Lithuania and the greatest center of Talmudic scholarship in the world.

Meanwhile the overflowing immigration of Russian Jews to America, ushered in by the anti-Semitic riots of 1880, had built up on the east side of New York at once the largest and most prosperous Ghetto of modern times. Ambitious to outstrip the people at home, the refugees imported many of the celebrities of the old Ghettos of Russia, Poland, Galicia, and Roumania. They did not rest until they had secured the best synagogue singers, the leading wedding band, and every Yiddish actor known to fame.

When it was decided to invite a celebrated Talmudist to become the religious head of the East Side, the choice of the eighteen synagogues which had formed a joint organization for the purpose naturally fell upon the town-preacher of Wilna.

Rabbi Jacob Joseph arrived in New York on July 7, 1888. His advent was hailed as the opening of a new era in the history of American Judaism, as the beginning of a great religious revival not only on the east side of New York, but in the Jewish colony of every city in the United States. There is no hierarchy in the Church of Moses, yet the newly arrived Talmudist was proclaimed chief rabbi, the older orthodox rabbis of New York being expected to recognize his authority of their own accord and out of respect for his superior erudition.

His first sermons on American soil attracted the largest crowds ever seen on similar occasions on the East Side, but while these sermons fully bore out his reputation for learning and acumen, the more far-sighted of his friends came away heavy-hearted.

There were plenty of immigrants from Wilna among those who came to hear him, and somehow the same people who had admired his exhortations at home met them rather lukewarmly in New York.

Rabbi Joseph was the same, but his listeners had changed.

During the three or four years which they had

spent under American influences they had lived more than they had in all the forty or fifty years of their life at home; and although many of them still clung to the essentials of their faith, they had learned to wear short coats and to dispense with their side-locks, or even to shave their beards. They had fallen into the way of going to theaters and reading newspapers; they had attended public evening schools, and picked up a thousand and one of the little things which go to make up modern civilization, and without which life now did not seem to them worth living.

Rabbi Joseph remained the man of the third century he had been brought up to be, while his fellow country people, whom he came here to lead, were in hourly contact with the culture of the nineteenth century. A gap was yawning between the chief rabbi and his people, one which symbolized a most interesting chapter in the history of Israel, but which foreshadowed the tragedy of the newcomer's life in this country.

People who came in contact with him were fascinated by his magnetic personality. He was a plain-spoken, mild-tempered, unsophisticated, modest man. His heart went out to Lithuania. There are college-bred people in Wilna, too, but there the old-fashioned members of the community still hold sway, while here the modern spirit has taken possession of every nook and cranny of the Ghetto. One cannot wear a long-skirted coat without being scoffed at as a "green-horn." The very Yiddish of the people on the East Side is full of English words and phrases to which the imported preacher was a stranger.

The worshippers who attended his sermons found them "green,"—a term applied in the New York Ghetto to everything that is not up to the American standard as interpreted by the East Side. They looked down upon his ways as they do upon the man who has not replaced his Russian cap by a Grand Street hat. The celebrated Talmudist strained every effort to adapt himself to his new environment. He took pains to say "street" instead of *gass*, and "room" instead of *zimmer*; he strove to intersperse his good Lithuanian Yiddish with broken bits of English phraseology, as he saw his followers do; but all this, so far from tending to bridge over the gulf between him and his flock, only seemed to accentuate the unnaturalness of his position. His audiences were gradually thinning out. His sermons became few and far between.

He was the same Jacob the keen-witted as of yore, but the people to whom he addressed himself had heard scores of effective speakers in Yiddish and in English.

The older rabbis of the Ghetto were not slow

to appreciate the situation. Not only did they refuse to recognize his superiority, but they even added the title of "chief rabbi" to their names. Thus the East Side found itself in possession of as many chief rabbis as it had orthodox religious teachers.

One of the innovations introduced in the name of Rabbi Joseph was a system of supervising the "kosher" slaying of cattle. In order to insure that the meat bought by the faithful was prepared in accordance with the laws of Moses and the Talmud, a force of inspecting rabbis and *shochtim* (slayers) was appointed. These acted under the supervision of the chief rabbi, and the patrons of those wholesale butchers who submitted to this system received certificates declaring their meat "kosher."

This gave rise to a conflict of interests in the meat business. The Ghetto was torn into factions, the butchers of each faction displaying the certificate of a different "chief rabbi" in his window.

The enemies of the new system charged Rabbi Joseph with trying to force upon the poor people a *corobka* (meat task) like the one imposed upon the Jews in Russia. As a matter of fact, however, he had very little to do with the practical side of the measure. He was neither a man of affairs nor a fighter. He remained absorbed in the intricacies of his Talmud; remained absorbed in the third century, in which he had dwelt all his life. His great desire was to be

allowed to read his holy books undisturbed. But the meat certificate which bore his name proved to have a far greater fascination for the pious housewife of the Ghetto than those of his rivals, and the struggle became more bitter every day. People accused the organization which paid him his salary of acting in league with a butcher trust, and the rabbi himself with serving the rich against the poor. To cap the climax, he delivered several sermons against trade unionism. In one of these, which was delivered upon the death of three Jewish children by fire, he explained the disaster as a manifestation of divine wrath called forth by the large numbers of Jewish workingmen belonging to labor organizations.

This was the saddest period of his life. Having spent all his former days in the peaceful study of his favorite subject, and amid the cordial reverence of devout men and women, he was now drawn into discussion of practical issues with which he had neither patience nor familiarity.

Chief Rabbi Joseph was the epitome of a world which was and still is, but is doomed not to be. The Talmud, which he knew so well, is the soul of a people; but another soul, the Modern Spirit, is crowding it out of the bosom of life on to the dust-covered shelves of history. In the Ghettos of America this process goes on much more rapidly than it does in Rabbi Joseph's birthplace. The celebrated Talmudist died here like a flower transplanted to uncongenial soil.

THE FUNERAL OF CHIEF RABBI JOSEPH IN THE STREETS OF THE "EAST SIDE," NEW YORK CITY.

# THE RUSSIAN JEW IN AMERICA.

BY MAURICE FISHBERG, M.D.

THE history of the Jews in America begins with the discovery of the continent by Columbus. It has been established beyond question that at least five Jews were with him on his first voyage. Among the first settlers in South America and Mexico, at the end of the fifteenth century, were many Jews, mostly refugees from Spain and Portugal. Some of these again emigrated to the colonies in North America. Many other Jews came directly from Holland, Spain, and Portugal. There are records showing that there were German and Portuguese Jews in New Amsterdam as early as 1650. At the time of the Revolution the number of Jews in the colonies was comparatively small; in 1818, Mordecai M. Noah estimated their number at 3,000, and Isaac C. Harby put it at 6,000 in 1826. The American Almanac of 1840 speaks of 15,000. The number of Jews in the United States did not materially increase up to 1880, when a committee appointed by the Board of Delegates of the American Israelites estimated them at 230,257. The Russian Jewish immigration began at that time, and in 1888 Isaac Markens estimated the American Jewry at 400,000, nearly double that of eight years before. The American Jewish Year Book for 1901-02 shows that in 1900 there were 1,058,133 Jews in America. The largest number, 400,000, is credited to New York; Pennsylvania, with 95,000; Illinois, with 75,000; Idaho and Nevada appear as having the least,—300 Jews each. This estimate is far too low. According to a statistical investigation by Mr. Joseph Jacobs, based on the number of dead interred in Jewish cemeteries, it has lately been calculated that there are at the present time 584,788 Jews in Greater New York, which is 184,788 more than that of the American Jewish Year Book. The same is probably true of Pennsylvania, Illinois, etc. I think that 1,500,000 is nearer the truth. This means that there are more Jews in the United States than in any other country, excepting Russia and Austria-Hungary. Greater New York, with its 584,788 Jews, has more than Prussia (379,716), France (80,000), and Italy (50,000) combined. When the first Russian-American Congregation was organized in New York, on June 4, 1852, it had less than two dozen members. But since 1882 the number of Russian Jews has been rapidly increasing, and at present their number in Greater New York is estimated at 367,690.

After Alexander II. was assassinated on March 14, 1881, repeated anti-Jewish riots broke out in various parts of Russia. Thousands of Jewish homes were destroyed, and many Jews who were rich, or at least in easy circumstances, suddenly found themselves reduced to poverty. The police and the military authorities did not, in the majority of these riots, make any serious attempts to help the Jews, and in many instances it is known they even assisted in the pillaging of Jewish property. The cause of these riots is known to have been purely political. The constant discontent of the Russian peasants, due to incessant oppression by the Russian authorities and unbearable taxation, endangered the stability of the new government under Alexander III. The government and the inspired press used the Jew as a means of distracting the minds of the common people from their discontent and revolutionary tendency. They pointed out that many of the younger Jews participated in the revolutionary movement of the Nihilists, and that the Jews were consequently responsible for the death of the "Czar-Emanicipator."

The distressing condition of the Jews became absolutely intolerable on May 15, 1885, when the so-called "*May Laws*" were enacted in Russia. These consist essentially of the establishment of the "Pale of Settlement" of fifteen governments (districts) in Poland, Ukraine, Lithuania,—"All stolen by Russia from other people" (Harold Frederic),—in which the Jews may live, and prohibiting them from living in the interior of Russia. In the "Pale" the Jews may live only in towns and cities, and not in the villages. All the leases and mortgages held by the Jews on landed estates were canceled by this act. These laws, in addition to older laws exacting from Jews special taxation on property, rents, legacies, breweries, vinegar factories, printing presses, etc., made it practically impossible for the bulk of the Jews to sustain themselves. Even meat killed "kosher" is taxed in Russia, so that a Jew has to pay for a pound of meat nearly double the price for that which is not "kosher." Jewish children are admitted to the high schools and universities to the extent of only 5 per cent. of the population; and, as there are cities in the "Pale" in which the population consists of more than 50 per cent. of Jews, the benches of the high schools are vacant, while hundreds of the Jewish youth are vainly applying for admission. The re-

sult of these restrictions can be easily imagined. The first relief came by emigration. Baron de Hirsch rendered some assistance. He aided many to emigrate to Argentine and to Canada. But the United States, with its great opportunities, attracted most of them, and up to date over 600,000 Russian-Jewish immigrants have settled here. Freedom from oppression was the chief attraction to this country. Then the great opportunities offered in the United States to the Jews,—whose enterprising spirit, tenacity of purpose, and inexhaustible energy are well known,—were other attractions. Here he may engage in any business, trade, follow any vocation, and as long as he does not violate the laws of the country he is not interfered with. The schools and universities are open to him,—a fact which attracted many. I personally know a goodly number who have emigrated to the United States for the last reason alone. All these, and many other minor causes, have been operative in the Jewish immigration to America, and it is predicted that if conditions in Russia keep up in the manner they have for the last twenty years, at least one-half of the Jews in Russia will emigrate to the United States within the next quarter of a century.

#### OCCUPATION OF THE JEWS IN RUSSIA.

It has been stated by people who have never been in Russia that the Jews never engage in any occupation requiring manual labor; that they are nearly all merchants, small traders, agents, and solicitors. How false this is can be seen from the statistics gathered by Mr. Joseph Jacobs, showing that 12 per cent. of the entire population of the "Pale" are artisans (Jewish Encyclopedia, Vol. II., pp. 115-116), which is a higher proportion than in the general communities of either France or Prussia. They work as tailors, shoemakers, furriers, bookbinders, house painters, opticians, diamond setters, glovers, tanners, watchmakers, etc. In fact, I have observed that in many cities in the Pale no work can be done on Saturdays because the Jewish artisans observe the Sabbath; and it is agreed by all who are acquainted with the conditions, that should the Jews leave in a body it would cause an industrial and commercial disaster in Russia from which it would take years to recover. In the "Pale," particularly, there would be no skilled artisans to replace them. It is also agreed by all that as skilled artisans they are of the best. In fact, the Russians give them preference on account of their skill, steadiness, and sobriety, the two latter qualities being uncommon among the Russian workmen to the same extent. Besides all these, the Jews are

represented in the learned professions to a greater extent than the Russians. There is a considerable number engaged in the practice of medicine, law, architecture, engineering, journalism, and the like. A great number have also achieved international fame as musicians, painters, sculptors, writers, poets, and scientists.

#### THE JEW PHYSICALLY.

The two most important characteristics of the Russian Jew are their short stature and their contracted, flat chest. Their average height is about five feet four inches, equaling in this regard the average American youth, who has yet two to three inches to grow. I have observed, by measuring 3,000 Jews of all ages in New York, that this short stature improves greatly under the favorable environment of the United States. I find that the Jews born here are about one inch taller than their Russian parents. The same can be stated about their characteristic narrow chests. Those Jews born in the United States are decidedly of superior development. The characteristic "Jewish" attitude of the body and the peculiar facial expression, coupled with that long, narrow, prominent, and hooked nose, so much exploited by the caricaturists, is a myth in the case of the Russian Jews. Any one passing through the streets of the East Side will soon be convinced of this fact. We find here not one, but at least a dozen Jewish "types,"—Jews with long faces and Jews with broad faces, the latter reminding one of the Mongolians; long, broad, curved, hooked, prominent, and flat noses. While the majority of the Jews have dark hair and eyes, still we find a large proportion of blondes, with light or red hair, and blue or gray eyes. All these physical traits are of importance from the anthropological standpoint, throwing some doubt on the supposed purity of the Jewish race.

To dispel an erroneous inference, we must emphasize that the stunted appearance of the Jew by no means incapacitates him from meeting the usual contingencies of every-day life. As has been shown by Herbert Spencer, tall and muscular men, who can lift great weights, jump great heights, or run great distances, are not usually the ones who are fitted to withstand the strain of modern life, or do hard work under unfavorable conditions. In the case of the Jew, we may observe the energy he lacks in his muscles is chiefly concentrated in his nervous system, thus adapting him to withstand the hazards of modern civilization, when brute force is of rather secondary importance.

Arriving at New York, the Russian Jew finds himself handicapped to a greater extent than immigrants of other nationalities. Besides the lack of the English language, he also finds all the con-

ditions different from those under which he was reared in his native country. It must be recalled that the industrial development of Russia, particularly the fifteen governments of the "Pale," is at least fifty years behind that of the United States. Any trade that he may have spent years in acquiring he must learn over again, according to American methods. The only useful qualification a Russian immigrant brings over with him to the United States is his adaptability. This he has acquired during constant migrations for the last two thousand years, bringing him in contact with all peoples and their civilizations, and rendering his organism pliable. This power of easy adaptation to a new environment is peculiar to the Jews to such an extent that scientists are inclined to consider them a cosmopolitan people, who can live and prosper in all continents, in all climates, and under any environment. Another characteristic of the Jewish immigrant is his readiness to absorb and assimilate new ideas, new sentiments, new conceptions of life, and in the course of one or two generations the descendants of that uncouth Russian Polish Jew appropriate American modes of life and activity, and are no more to be distinguished from the surrounding population. It is all due to his ready response to new environment and new spirit of the time.

#### SOCIAL AND INDUSTRIAL LIFE IN NEW YORK.

Looking at the conditions in the lower East Side of New York City, we can observe clearly the metamorphosis the Russian Jew has undergone in the course of a few years' residence here. It is rare to find a Jewish child below thirteen years of age who does not attend public school. After graduation from the grammar school, many avail themselves of the education offered in the City College, high schools, and normal colleges, as well as the universities. Over 60 per cent. of the students of the City College and the Normal College are known to be children of the Ghetto. The professions are being crowded with "East Siders." The Eastern Medical Society has a membership of four hundred physicians and more than 50 per cent. of these entered the profession within the past ten years. There are in New York, I am informed, at least fifteen hundred lawyers of Jewish faith, more than one-half of whom were admitted to the bar within the last ten years. Most of the city departments have East Side Jews employed in various capacities. On Broadway and the surrounding streets one observes the immense number of Jews engaged in the various business pursuits,—the Cohens, the Levys, Goldsteins, Goldbergs, Silversteins, etc., are in the majority. In fact, the

tailoring and the allied trades largely are in Jewish hands. A great proportion of these Broadway merchants and manufacturers are Russians, who have been less than twenty years in the United States. The Russian Jew who living on the East Side, meets with prosperity moves uptown, as a rule. He thus does what the Americans, Irish, and Germans have done.

The opinion entertained by many that the Russian Jews are mostly engaged in tailoring and peddling is erroneous. While it is true that most of the clothing worn by the people of America has been produced by Jews, still it is a fact that not more than 20 per cent. of Russian Jewish artisans are engaged in tailoring. Another important point is that the Jews in America have revolutionized the tailoring trade by practically destroying the market for second-hand clothing. For the same price, and even less than had to be paid for second-hand clothing ten years ago, one may procure new clothing. The value of this from the hygienic standpoint cannot be overestimated.

There are very few factories in which one may not find a certain proportion of Jews employed. As furriers, jewelers, diamond setters, watch makers, house painters, carpenters, tanners, and cigar makers they are known to be skilled. The women work at neckwear, millinery, artificial flowers, and cigar and cigarette making and the easier forms of tailoring. Many are engaged as saleswomen in the department stores; as clerks, bookkeepers, and typewriters in the office buildings down town. The public schools in the Ghetto district of New York are mainly taught by Jewish women.

Socially, also, the Russian Jew has peculiarities. The older generation does not know anything about modern social organization of clubs; neither do they spend their leisure hours in saloons or other questionable resorts. But they invariably enroll their names on the list of one or more benevolent societies, secret orders, and congregations. This is new with him. In Russia there are no benevolent organizations. The strict laws of the bureaucratic government prohibit any form of organization. Here it is the greatest pride of a Jew to become an officer of a benevolent society, and his wife and children share the pride.

The majority of the Jewish laborers who have been in this country for some time are members of the labor unions of their trade. Some trades in the East Side are organized to an extent equal to that of American or British skilled laborers.

The younger generation have their social clubs of which there are a good number on the East Side. To their credit it must be said that these clubs have no bars where spirituous liquors are sold. They prefer to drink soda water. When

ever these clubs or societies arrange for a ball or picnic, they are charged double rates for the use of the hall or picnic grounds; the excuse given by the proprietor is that he will sell very little liquor to Russian Jews, the proceeds of such sales being his chief source of income.

The East Side maintains three Jewish theaters and several music halls. In the former one can often see some excellent productions, well staged and acted by talented artists. The latter are, on an average, below the standard which might be desired. The theaters also are practically an American development, because for the past fifteen years the Russian government has prohibited Jewish theaters.

There are six daily papers published in the East Side, with a combined circulation of over 100,000 daily. The habit of reading a daily paper has also been acquired in America. The Russian Government does not permit the publication of a Yiddish newspaper, though there are a few Hebrew papers, whose circulation, however, is limited. Here nearly every Jew reads his daily paper, and as almost all the Russian Jews can read Yiddish, there is a good reason for the existence of the six dailies. The public libraries in New York City are patronized by the Russian Jews proportionately more than by others. This fact will be attested to by all the librarians in the city. It is remarkable how infrequently they apply for modern popular fiction. The Aguilar Free Library in the Jewish section circulates more of the works of Spencer, Darwin, Huxley and similar writers and philosophers than any other library in New York.

It has been charged that the Russian Jew is not amenable to sanitary and hygienic teachings. The Beth Israel Hospital, founded and maintained in the most excellent condition by Russian Jews in New York City, is good proof to the contrary. It can be stated positively that nearly every Jewish man, woman, or child is vaccinated. There were, therefore, less than ten cases of smallpox among Russian Jews during the recent epidemic, although the disease was raging uptown. In case of contagious disease, when the Health Department placards a house, no neighbor will enter it for fear of contagion. The United Hebrew Charities has lately inaugurated a systematic campaign against tuberculosis in the East Side. Miss Gertrude Friedlander, who was assigned by this organization to instruct the relatives of the consumptives of the dangers of contagion, has achieved remarkable results. Most of the consumptives referred to me for examination are anxious to learn how to save those dear to them from becoming infected with the dread disease. This shows that

the Jew is receptive when approached by a competent person. This he also learned in the United States. In Russia, very few Jews know about the dangers of contagion, and the hospitals are in the most pitiful state from the hygienic standpoint.

#### POLITICAL ACTIVITY OF THE JEWS.

Many of the younger people have their names enrolled in the political organizations. It cannot be stated that any political party is given preference. There are probably as many Russian-Jew Republicans as Democrats. It may be stated, though, that the majority of the business men vote the Republican ticket in federal elections and the Democratic in municipal elections. That the Russian-Jewish vote cannot be bought was demonstrated at the last municipal election in New York City. The Jewish districts went solidly for the Reform ticket, although in previous elections Tammany Hall almost invariably carried these districts.

Some are adherents of the various socialistic political organizations in the East Side, but the Socialists are constantly losing ground here. After living for some time in the United States the Russian Jew learns to appreciate our form of government, which he, for obvious reasons, enjoys more than any one else. And during our late war with Spain, proportionally a greater number of Russian Jews enrolled in the volunteer army than of the other immigrant population in the United States. The regular army also has a good number of Russian Jews in its ranks. Their bravery, energy, and power of endurance has frequently been praised by officers of the army.

We thus see that the Russian Jew is adapting himself to American life. Physically he improves his stature, chest development, and muscular system under the favorable environment of the United States. He prospers in business to a greater extent than most other immigrants; he supplies a large contingent of people engaged in intellectual and professional pursuits as physicians, lawyers, teachers, architects, journalists, and the like. He adopts American habits, as club life, reads newspapers, organizes labor unions and patronizes the public libraries extensively. When called upon, he fights for the country which has given him freedom. All this, added to his steadiness, sobriety, and industrious habits, tends to show that the Jew of the future will be a good American citizen. The observation that the first generation of immigrant population tend to degeneration, for various reasons, does not hold good with the Russian Jew. Their descendants are positively improving physically, morally, and intellectually under the favorable influence of American conditions.

# THE CENSUS OF MANUFACTURES.

BY S. N. D. NORTH.

(Chief Statistician.)

THE twelfth census of manufactures was a gigantic statistical work, more difficult and complicated than any similar inquiry ever undertaken. It has been completed within two years from the date upon which the fieldwork began. This is in accordance with the mandate of Congress, which fixed a two-year time limit in the census act. It is less than one-half the time consumed in the compilation of similar statistics of previous censuses. Congress was impressed with the idea that industrial statistics, to be of practical and contemporaneous value, should be available within a reasonable time from the period to which they relate. The manufacturing statistics of the census of 1860, taken just before the Civil War, were not published until after that war had closed. The data had been knocked somewhat awry by intervening events. The world moves so fast, the statistical data supplied from commercial sources is so complete and so prompt, that census figures of industry have heretofore possessed some points in common with last year's birds' nests. A great advance in celerity of publication has now been achieved; and those who have watched and pushed the work are convinced that under the favorable conditions created by the establishment of a permanent census office, it ought to be possible, at the thirteenth census of 1910, to gather, compile, and publish the statistics within one year. Nothing is impossible when there is money enough to do the work and skillful and experienced clerks to handle it. It has taken Congress a long time to discover that a permanent census office will prove a great money saver, while incidentally adding materially to the accuracy and the value of the census statistics.

## COST OF OUR INDUSTRIAL INVENTORY.

It has cost \$1,200,000, in round numbers, to take and collate the statistics of manufactures for 1900. It is a goodly sum of money; but it is worth what it cost to find out in definite and tangible figures just where the United States stood, industrially, in the last year of the nineteenth century. It is the national stock-taking,—and it is interesting to note that the United States was not only the first nation to take an industrial census, but remains the only one to take such a census in a manner at all comprehen-

sive and satisfactory. Our census of manufactures is due to Albert Gallatin, who, when he was Secretary of the Treasury in 1810, suggested to Congress that \$30,000 out of the \$150,000 appropriated for the third census be set aside for this purpose. The modest sum proved sufficient, and the difference between this \$30,000 and the \$1,200,000 expended for the manufacturing census of 1900 is a good measure of the industrial growth which has intervened.

## A CENTURY'S MARVELOUS RECORD.

The balance sheet, as we strike it from the census figures, tells a story of progress and prosperity so impressive as to be almost startling. The average American is no doubt too much addicted to bumptiousness when he talks or writes about our achievements as a people. But he has his census to justify his statements, for the statistics show that, however much he may seem to be given to exaggeration, he does not in fact exaggerate when he measures our progress by that of other nations.

It is difficult to reduce the great mass of census figures to simple concrete terms that tell the whole story at a glance; but the brief table on the next page compresses a good deal of the industrial history of our country for the last fifty years into small compass. It embodies what may be called a bird's-eye view of the progress of manufactures during the half century.

The manufacturing statistics of the censuses prior to 1850 were too imperfect and fragmentary to make it proper to accept them as a measure of industrial growth in the first half of the century. But Tench Cox, analyzing the manufacturing statistics of the census of 1810, and reading into them 25 per cent. of products beyond what was actually returned, ventured to estimate the total value at something less than \$200,000,000, including in that total the products of the household industries, which then embraced a great preponderance of the articles now manufactured under the factory system. Contrasted with that figure, we now have a gross total of \$13,014,287,498, or an increase of more than sixtyfold. There is nothing in history which approaches or approximates this increase. It must remain for all time to come the unique and phenomenal chapter in the world's economic development.

COMPARATIVE SUMMARY, 1850 TO 1900, WITH INCREASE PER CENT. FOR EACH DECADE.

	Date of census.					Increase per cent.			
	1900	1890	1880	1870	1860	1840 to 1860	1850 to 1870	1860 to 1880	1870 to 1900
Number of establishments.....	512,339	355,415	253,852	252,148	140,433	44.2	40.0	0.7	14.1
Capital.....	\$9,835,080,969	\$6,325,156,486	\$2,790,272,606	\$2,118,316,790	\$1,009,855,715	53.7	133.9	31.7	101.8
Salaries.....	397,174	401,008	*	*	*	91.8	*	*	*
Wage earners, average number.....	\$404,230,274	\$391,425,208	2,732,595	2,633,008	1,311,248	25.1	55.0	33.0	54.6
Total wages.....	3,316,852	4,251,013	\$97,363,705	\$775,394,343	\$578,673,096	25.1	100.5	22.2	174.7
Men, 16 years and over.....	\$2,328,601,254	\$1,891,225,321	2,019,065	1,615,398	1,040,949	27.7	64.8	25.0	63.0
Women, 16 years and over.....	4,116,610	3,357,042	*	*	*	27.8	*	*	42.3
Wages.....	\$2,021,334,578	\$1,650,254,483	531,639	328,770	270,867	28.4	51.2	64.2	19.9
Children, under 16 years.....	1,601,609	805,096	*	*	*	20.5	43.6	34.7	*
Miscellaneous expenses.....	\$251,680,764	\$215,367,976	181,921	114,028	*	43.3	52.0	36.5	141.2
Cost of materials used.....	\$25,661,662	\$16,625,862	*	*	*	42.3	74.5	*	85.1
Value of products, including custom work and repairing.....	\$1,028,065,611	\$651,225,065	\$3,300,822,549	\$2,488,427,242	\$1,061,605,082	38.9	*	*	*
	\$7,348,144,755	\$6,162,044,076	\$5,309,579,191	\$4,532,325,412	\$1,885,861,676				

\* Not reported separately. † Decrease. ‡ Not reported.

Measuring progress by long periods of time, it suggests that it has been possible, in one century, in one nation, statistically to record an advance nothing at all equivalent to which occurred in any one thousand years in any other country, at any preceding epoch. It appears to be a satisfactory answer to the contention that the condition of the masses does not improve with the advance of civilization. For, however true it may be that a large part of the increment has gone to comparatively few, the figures represent not merely an increase of wealth, but a distribution and diffusion of wealth such as the world has not known before or elsewhere.

## GROWTH OF MANUFACTURES SINCE 1850.

Leaving figures more or less apocryphal, we may profitably confine ourselves to those from the census of 1850. In comparison with that census there has been an increase in capital invested in manufactures approximating seventeenfold; in the average number of wage earners, about four and one-half fold; in amount of wages paid about ninefold, and in value of products about twelvefold. The population of the country has in the meanwhile increased two and one-quarter fold, and the value of agricultural products something less than twofold. While these comparisons must be made with many reservations, they nevertheless afford an approximate exhibit of the enormous increase in manufactures which occurred in the United States in the last half of the nineteenth century. They are particularly suggestive as an indication of the increasing productive capacity of labor, due chiefly to the increased effectiveness of machinery and the largely increased investment of capital. The apparent value of products per wage earner has increased from \$1,065 in 1850 to \$2,448 in 1900. Another way of putting it may be illustrated by the textile industries, in which it appears that all the cloth necessary to clothe 76,000,000 people was made by 640,548 persons, or much less than one person in a hundred. Machinery involves a constantly increasing investment of capital, to make possible this increased efficiency of labor; and the increased horse power employed in manufacturing is, on the whole, the most striking fact brought out by the twelfth census. The total horse power so employed was reported in 1890 as 5,954,655; in 1900 as 11,300,081, an increase of 89.8 per cent. in ten years,—altogether the largest increase shown at any point in the statistics. It is commonly calculated that one-horse power, whether water, steam, electric, or what not, is equivalent to the labor of ten men,—a very low average, since it makes no allowance for the fact that the engine never tires and never

varies. It means that the horse power employed in our manufactures in 1900 was equal in its producing capacity to the labor of 113,000,000 able-bodied men, working every day in the year. How insignificant in contrast appears the contribution to industrial wealth of the 5,316,802 men, women, and children,—the actual average number of persons employed in the census year to direct and supplement this tremendous power. It needs figures of this definite magnitude to enable us to understand how rapidly power-driven machinery is increasing its relative ascendancy over hand labor in American manufacturing, and how enormously the power of man has increased to develop the wealth which nature holds in store.

#### ADVANCE OF ELECTRIC POWER IN A DECADE.

One interesting phase of these statistics of power should be noted in passing. The electric motor is just beginning to make itself felt in manufacturing. The number of such motors in use in 1890 was not reported; but they were credited with 15,569 horse power. In 1900 the number of motors was 16,923, with a horse power of 311,000—only 2.7 per cent. of the total horse power employed, but an increase of nearly nineteenfold in ten years, and a prophecy of what is to come, and to come quickly. For already, since the census was taken, electric power has made giant strides in our manufacturing establishments, and everywhere it means an economy of power and an increase of efficiency. The census makes record of the results of the utilization of the water power at Niagara, at the Sault Ste. Marie, and at many other points, for the generation of electricity to drive the machinery of mills located at distant points. Thus it happens that the new motive power, instead of superseding water power, is bringing into use many such powers not advantageously situated for mills, but which can be utilized at great distances, in the centers of industry and transportation.

#### MACHINERY REPLACES HAND LABOR.

To the much more general use of power-driven machinery in this country may safely be attributed the remarkable advance of the United States to the first rank among the manufacturing nations. The late Michael G. Mulhall, the English statistician, states that (in 1896) "nearly all American manufactures are produced by machinery, while in Europe more than one-half is still handwork;" and this is his explanation of the fact he concedes, that the United States, although the last of the manufacturing nations to enter upon the factory system of production, and holding the fourth rank in production in 1860, being then

surpassed by Great Britain, France, and Germany, in the order named, has now jumped to the first place, Germany having also passed France in the interval.\* If we can accept Mr. Mulhall's basis for estimating the value of the manufactures of the United Kingdom, they reached a total of \$5,400,000,000 in 1900, which was nearly \$3,000,000,000 less than the net value of the manufactured products of the United States as shown by the twelfth census.

#### "NET" AND "GROSS" VALUES AS DETERMINED BY THE CENSUS.

It should be here explained that the "net" value, as ascertained by the census, is the value that remains after deducting from the "gross" value of \$13,000,000,000, the value of all the partially manufactured products which became the materials of other establishments in an ascending series of industrial conversions, and were thus duplicated and sometimes reduplicated in the tabulation of the individual returns. The amount of the duplication and reduplication thus occurring was \$4,633,804,967, the cost of partially manufactured materials used, leaving a "net" value of \$8,370,595,176, which represents the original cost of raw materials, plus the value added by all manufacturing processes. Of this net value the raw materials represent 28.5 per cent., and the remainder practically represents the labor cost of manufacture, in one form or another.

The "gross" and "net" values of our manufactures, as reported by the census, have hitherto been the source of much misapprehension of the statistics, and have led to many charges that the census greatly exaggerates the volume of our manufactures. The criticism has some foundation, and the twelfth census has sought to avoid it. At the same time it remains the fact that gross value truly represents the volume of commercial transactions involved in manufacturing enterprise, in much the same way that the total transactions of the bank clearing house of a city represent the actual bank transactions of that city. Wholesale and retail trade in the products of manufactures represent another series of transactions, involving values much greater than the gross value of products; it consists of the distribution, selling, and reselling of these products as they pass directly, or through middlemen, into the possession of the ultimate consumers. The total volume of these transactions in the United States is unquestionably greater than that of the international trade of the principal countries of the world, which amounts to the sum of \$20,000,000,000 (exports and imports added to-

\* "Industries and Wealth of Nations," by Michael G. Mulhall. 1896.

gether), and which likewise represents, very largely, the duplicated value of articles in various stages of manufacture sold twice or thrice.

**AGRICULTURE GIVES WAY TO MANUFACTURES AS THE CHIEF SOURCE OF NATIONAL WEALTH.**

Another interesting fact brought out by these statistics is the advance of manufactures to the first place among the sources of national wealth, exchanging places with agriculture, which has heretofore been the chief contributor to the annual national increment. Until the census of 1890, the supremacy of agriculture was not open to question. But somewhere in the decade preceding that census, manufactures passed agriculture, after making all possible allowance for deficiencies and duplications in the statistics. The census of 1890 placed the value of the products of agriculture at \$2,460,000,000; but it omitted the value of live stock on farms, of stock sold for slaughter, etc., and statisticians have accordingly increased the figure to \$3,289,000,000. The gross value of the products of manufactures were returned at the same census as \$9,372,000,000. By deducting the value of all materials consumed in 1890, whether raw or partially manufactured, there remained a residue of \$4,210,000,000, which may be called the value added to raw materials by the several processes of manufacture. It is a sum just about one billion dollars in excess of the highest estimate of the value of the agricultural products of 1890; and no room is left for doubt that agriculture had thus been left in a subordinate position. This is greatly emphasized by the census of 1900. Agriculture reports a gross value of \$4,740,000,000; manufactures a "net" value of \$8,370,000,000, or nearly twice that of agriculture. This is a demonstration entirely at variance with the common understanding and belief. The development of our agricultural resources has been so rapid, and has become so important in the food supply of the world, that economists have overlooked the much more rapid growth of manufactures in the last twenty-five years. M. Emile Levasseur, the distinguished French economist, whose studies of census statistics, in connection with his great treatise, "The American Workman," brought him face to face with it, simply refused to accept it. "I cannot believe," he wrote, "that a value greater than that of the product of agriculture has been added by the processes of manufacture."

**TRANSFERENCE OF INDUSTRY FROM FARM TO FACTORY.**

M. Levasseur's incredulity is due to his failure to appreciate the remarkable advance of manu-

factures into the domain of agriculture. The factory system gradually destroyed the household and neighborhood industries, and it steadily pursues its encroachments upon the farm. The great Southern industry of cotton ginning, formerly performed exclusively on the plantation, is rapidly passing over to large and thoroughly equipped establishments, which gin the crops of great areas. In 1870, the census did not report a pound of butter made in factories; in 1880, 30,000,000 pounds, out of a product of 807,000,000, was factory made; in 1900, the factory product of butter was 420,126,000 pounds, out of a grand total of 1,492,699,000 pounds, the factory product being 28.2 per cent. of the whole. Cheese making shows a still more remarkable transformation. In 1860, there was no cheese making in factories reported. In 1870, the factories made more than one-half our cheese; and in 1900, the farms made but 16,372,000 pounds, or less than 6 per cent. of the whole product of 300,000,000 pounds.

Illustrations might be multiplied indefinitely to show the encroachment of the factory upon the function of the farm. Indeed, it is becoming a most difficult matter for the census makers to determine where to draw the line between agriculture and manufactures in many branches of industry. But the farm is the twin sister of the factory; they flourish or are depressed in perfect sympathy; and American supremacy in manufactures is due, in very large degree, to the abundance of our agricultural products. Of the raw materials consumed in manufactures, agriculture supplied \$1,940,727,000 in value, or 81.2 per cent. of the total; the mines supplied \$319,975,000, or 13.4 per cent. in value; and the forests \$118,803,000, or 5 per cent. of the total; while from ocean, lake, and river came only \$9,635,000, or 0.4 per cent. The farmer and the manufacturer are bound by an umbilical cord, and together they share prosperity or depression.

**THE SCIENTIFIC GROUPING OF STATISTICS.**

The twelfth census is the first to divide the manufacturing industries of the country into groups, or families, on the basis of the raw materials employed, or the kindred uses to which products are put. The relative importance of the several families of industry is thus clearly shown. There are fifteen of these great industry groups, six of which reveal a gross value of products exceeding one billion dollars each. These great family groups of industries are divided into numerous classes, 354 in number, regarding each of which the census gives detailed statistics. These 354 classes of industry correspond, in a

measure, to the "species" of natural history, while the fifteen grand groups are analogous to the "genera," the whole making the great "order" of manufacturing industry. Thus the twelfth census has found it possible to treat the statistics of manufactures by scientific methods, unifying the fundamental resemblances, and measuring the relative importance of each distinct group.

We can thus trace in the statistics the most notable of all the modern tendencies of manufacture, that toward greater specialization in every group, a movement in which the single establishment tends more and more to confine itself to one product, or even to single parts of a product, —to the making of yarn for mills which simply weave, as an illustration. This specialization permits the successful utilization of smaller capital, in individual mills, than would be necessary if each establishment must begin with the raw material and carry it forward, through many expensive processes, to the finished article. The processes are fewer, the turn-over quicker, and the results are often better, through closer supervision and the concentration of expert skill upon the perfecting of a single article. It is specialization, therefore, which enables an increasing number of comparatively small establishments to exist and to flourish side by side with an increasing number of very large establishments. It is specialization which justifies the belief that the giant corporation, or industrial combination, is not destined to swallow up and obliterate all the smaller mills and factories of the land.

At the head of the fifteen grand groups of industries stands the manufacture of food products, producing \$2,277,702,010, or 17.5 per cent. of the total gross value of products. The other groups are (2) textiles and their re-manufacture, with products valued at \$1,637,484,484, or 12.6 per cent. of the whole; (3) iron and steel, and their multitudinous products, valued at \$1,793,490,908, or 13.8 per cent. of the total; (4) lumber and its remanufactures, \$1,030,906,579, 7.9 per cent.; (5) leather and its products, \$583,731,046, 4.5 per cent.; (6) paper and printing, \$606,317,768, 4.7 per cent.; (7) liquors and beverages, \$425,504,167, 3.3 per cent.; (8) chemicals and allied products, \$552,891,877, 4.3 per cent.; (9) clay, glass, and stone products, \$293,562,235, 2.3 per cent.; (10) metals and metal products other than iron and steel, \$748,795,464, 5.8 per cent.; (11) tobacco, \$283,076,546, 2.2 per cent.; (12) vehicles for land transportation, \$508,649,129, 3.9 per cent.; (13) shipbuilding, \$74,578,158, 0.6 per cent.; (14) miscellaneous industries, \$1,004,092,294, 7.7 per cent.; (15) hand trades, \$1,183,615,478, 9.1 per cent.

This grouping is necessarily somewhat empirical; but it serves in a general way to bring out the relative importance of industries, from the point of view of the value of products. That this is not the true measure of relative importance from the economic view-point is shown from a further analysis. While the manufacture of food products stands first, in value of products, by reason of the intrinsic value of the raw materials operated on, it sinks to the seventh rank in number of persons employed, and to the eighth in amount of wages paid. Textiles and their re-manufacture rank first in number of employees, and second in amount of wages paid; while iron and steel, ranking second in number of employees, stands first in wages paid. It is evident, therefore, that, in an economic sense, these two are the most important among the great industrial groups.

#### THE PRODUCTS OF HAND LABOR.

The last of these groups includes what are known as the hand trades, as distinguished from manufactures proper, and they are now for the first time segregated and treated as a separate and distinct form of industry. They embrace the building trades, like carpentering, masonry, painting, etc., and millinery, repairing, custom boot and shoe making, etc.; they employed 559,130 persons, in addition to 242,154 proprietors, and returned a product of \$1,183,000,000, or less than 10 per cent. of the whole. As recently as 1869, in an article in the *Atlantic Monthly*, Gen. Francis A. Walker, the superintendent of the ninth and tenth censuses, stated that the contribution to the wealth of the country by its artisans or hand workers was far more valuable than that of its factory workers. If this was true at so late a date as 1869, the change from hand trade work to factory production has since been tremendous.

#### STATISTICS OF THE TRUSTS.

Perhaps the most interesting showing made by the twelfth census of manufactures is that regarding the so-called "trusts," or industrial combinations. The census makes a separate report for these corporations, of which it was able to locate 185, controlling 2,040 plants, located in many States, employing 400,046 persons, or 8.4 per cent. of the 4,749,276 employed in all the manufacturing industries, exclusive of the hand trades, which obviously are not susceptible to this form of organization; paying \$195,122,980 in wages, out of a total wage of \$2,034,215,456, or 9.6 per cent., and producing goods to the value of \$1,667,350,949 out of \$11,820,784,665, or 14.1 per cent. of the whole. These figures indicate with approximate accuracy the proportion of our manufactures that was controlled by

industrial combinations in 1900. It is not so large as is generally supposed; but it is considerably larger to-day than when the census was taken, and it shows very striking variations in the different groups of industries. It is lowest in the lumber manufacture, where only 2 per cent. of the product was made by trusts. In the textiles only 4.4 per cent. was so made, and in the leather industries only 7.8 per cent. But in the chemical manufactures, 33.4 per cent. of the total product was trust-made: in liquors and beverages, 22 per cent.; in metals, other than iron and steel, 24.1 per cent.; and in the iron and steel industry, 28.4 per cent. Since the census year the United States Steel Corporation has been organized, and in consequence the percentage of the total product of iron and steel controlled by industrial combinations is now very much greater than in 1900, and undoubtedly greater than in any other branch of industry.

An interesting exhibit connected with industrial combinations shows the actual investment of capital, as returned to the census, and the nominal investment represented by the bonds and common and preferred stock issued by them. Their actual investment in manufacturing, including the value of land, buildings, machinery, and all live assets, was \$1,461,631,743, as compared with \$3,093,095,868, the amount of securities issued; thus but 47.3 per cent. of the bonds and stock issued by these industrial combinations represented actual investment, such as is covered by the general census inquiry. The excess is what is commonly known as "water," and is based upon the assumed earning power of the corporations. It is not all water, however, because there are certain intangible assets, such as patents, trade-marks, "good will," etc., not represented in the census totals, and certain tangible assets, such as iron mines, railroads and steamboats, woodlands, etc., which are not directly employed in manufactures, and are therefore not included in the census return. That the public has already discounted the inflation of value represented in the difference between the two sets of figures is sufficiently evident upon a study of the quotations of the stock exchanges. The difference between the par value of these industrial securities and their value on the basis of actual investment is about the same as the difference between the par value and the market or selling value.

#### FACTS REGARDING VARIOUS INDUSTRIES.

The four mammoth volumes devoted to the census of manufactures are full of suggestive items of information about individual industries. For instance, it appears that the total production of liquors, distilled, malt, and vinous, in the

census year, was 1,325,000,000 gallons, a *per capita* consumption of seventeen gallons. There still appears to be work for the temperance societies. Nearly ten billion ordinary toilet pins were manufactured, besides 161,000,000 hairpins, and as many more safety pins. The old conundrum,—where do all the pins go?—is as far as ever from a satisfactory answer. The manufacture of steel pens reached 1,764,000 gross; and of lead pencils, 1,660,000 gross. Of boots, shoes, and slippers, 219,235,000 pairs were manufactured, and there were 49,979,000 pairs of rubber boots and shoes made besides; there appears to be no reason why any of our people should go barefoot. Of carpets of all kinds, 75,532,000 running yards were manufactured. Of woolen and worsted piece goods, 399,141,000 square yards were made, more than five square yards to a person; so that none of our people would seem to need to go naked. Of cotton goods there were woven the enormous quantity of 4,509,750,000 square yards, equivalent to nearly sixty square yards for every man, woman, and child in the country. Of hose and half-hose, 29,891,000 dozen pairs were made, and of knitted shirts and drawers, 15,819,000 dozen,—these two branches of manufacture representing forms of wearing apparel which less than sixty years ago were exclusively made by the women of the household. Perhaps no figures in the whole census mass illustrate more effectively than these the complete revolution in household economy which machine manufacture has brought about. It has relieved the woman of the largest part of her home duties, and thus driven her into the factory, the store, and the office. Of collars and cuffs, 121,000,000 were made in the factories, having a value of \$9,000,000. Fifty years ago a factory-made collar was practically unknown. Pianos to the number of 171,000 were made in the census year, not counting organs and melodeons; and the question is, where do they all go? No better test of the general prosperity of the masses of our people can be cited than the fact that they absorb this number of pianos, an absolute luxury, in a single year of good business. Of watch movements, 2,124,000 were made, exclusive of 1,211,000 cheap, or "dollar" watches, made in clock factories. Of typewriters, 145,000 were made, valued at \$5,624,000. As recently as 1872, not a typewriter had ever been marketed, and in the interval this American invention has revolutionized the correspondence of the world. Of sewing machines, 747,000 were made, exclusive of 55,000 sewing machines for factory use. Of bicycles there were made 1,113,000, a much smaller number than the average production of a few years ago, but enough to show that the bicycle has staying powers.

# AN INSTANCE OF PROFIT-SHARING.

BY SAMUEL CABOT.

TO any one who looks at the present industrial situation from either a utilitarian or a humanitarian point of view there must be much that seems most lamentable in the attitude of employer to employed, and still more in that of employed to employer. As the writer intends to give a short description of his own experiences and efforts, there are obvious reasons why he should pass by the humanitarian aspect of the question and lay chief stress upon the advantages from an economic point of view, both to labor and capital, of a more cordial coöperation.

Any one who has really watched the work of the operatives in a textile mill or print works from within, and for any considerable period of time, must be impressed with the conviction that if their work were for their own individual benefit, the amount accomplished would certainly in many cases reach 30 per cent. more, and in most at least 20 per cent. In addition to this, the economies of material and the saving of machinery would also be much greater. If the work is paid by the day, and not by the piece, this difference would of course be more marked, but even in piecework the gains possible for an interested operative as contrasted with an uninterested one may easily exceed the estimate above.

The writer having worked in such a mill, had these truths early "proned inter him," as the negro philosopher, Uncle Remus, expresses it. It thus became a settled purpose in his mind that he would try—in case he ever had occasion to run a factory of his own—to make the employees interested in economy and thrift on their own account. This he has now been able to do; and as it has been carried on for a period of fifteen years, the plan may be said to have passed the experimental stage.

The arrangement is a very simple one. Each operative who wishes to take part in the profit-sharing is required to sign a paper agreeing to give a notice of sixty days before leaving, and also to do all in his power to save expenses; and, in short, to render the business successful. In consideration of this a certain proportion of the net profits—known only to the proprietor, but always the same proportion—is divided among the profit-sharers *pro rata*, according to their wages, during the period just elapsed. In the writer's case the profits are calculated every six months. The profits are paid—one-half in cash to the participant, and one-half is placed in a savings bank

by the proprietor as trustee for the employee. If the employee dies in the service, his heirs are at once entitled to the accumulated fund in the savings bank, with interest.

If the operative desires to leave the works, and gives the required sixty days' notice, the fund remains at interest two years in the bank, and is then handed over to the operative, provided he has not sold the secrets or formulas he may have learned in the course of his employment in these works.

In case the employee should not keep his part of the agreement—should, for instance, organize a strike, stopping work without the required notice of sixty days—his accumulated profit, which is only contingent upon his adherence to the promises made to the employer, does not come back to the latter, but is divided into two equal parts, one of which is apportioned in cash among the operatives who have adhered to their bargain, and the other is added *pro rata* to their funds in the savings bank. It seems to the writer that it is of great importance that the money once divided should never come back to the employer again, as otherwise it would give room to suspicion that men were discharged in order to obtain their accumulated savings. If a man is discharged for cause, the employer has the right to turn his accumulation over to the faithful men who have kept their promises. There has been—in the writer's experience—but one attempt to systematically break this agreement, an attempt early in the arrangement to organize a strike. The result was a loss on the strikers' part of a considerable sum of money and the division of that sum among those who respected their promises. The strike lasted two days, and has never been repeated, the strikers begging to be taken back on the old terms.

And now in regard to the results. It is, of course, obvious that absolute tabulated figures are impossible in such a case, as much of the effect must be too subtle to be chronicled in dollars and cents. It is, however, the firm conviction of the writer that his men have given him a return upon the investment made fully equal to that which one ought to expect. The earnestness and diligence of the workmen seem much above the average, and moreover the thousand and one economies which are so important in an industrial plant are more than usually observed. In fact, from careful observation, it seems unquestionable that the advantages far outweigh the cost.

The class of workmen is not above the average of those in a silk or print works, yet the savings in the bank reaches already \$500 in many instances, and much more in a few.

The profit distributed among the thirty-five to forty sharers averages a little over 14 per cent. of the total wages they earn, and a considerable number of them have already received more than \$1,000 apiece in profits.

Although the sum distributed has been over \$25,000, the writer believes that the immunity from strikes for so long has been well worth the expenditure, leaving the much increased industry and economy as a profit to the employer.

In many instances this system might be modified to advantage, as, for example, by allowing the operative, after a term of years, to mortgage his bank savings to the employer. He could in this way be encouraged and enabled to build a home at an earlier date than he could otherwise hope to do. Such an arrangement would be also an advantage to the employer by increasing the number of permanent workmen of experience in the neighborhood of his establishment. But many other modifications will doubtless occur to the reader, and it is not the purpose of this paper to dogmatize upon the subject, but merely to state facts and results.

## THE BONUS SYSTEM OF REWARDING LABOR.

BY H. L. GANTT.

**A**WARDING extra compensation for extra work has long been the practice in successful manufacturing; but the particular method of awarding a *bonus* above referred to is of recent origin, and fills an important need in modern systems of management.

It may be briefly described as follows: Alternative ways of doing a piece of work are carefully investigated by the most competent expert available and the results recorded. The best method is determined and taught to an ordinary workman, who is awarded extra compensation in addition to his day's pay for doing the work in the time and manner specified.

This method of compensation was the outcome of an attempt to introduce in complicated work equitable piece rates determined as nearly as possible by scientific methods.

To understand the subject thoroughly it is necessary to become familiar with the work of Mr. Fred. W. Taylor, who was the first to apply the scientific method to the investigation of ordinary labor problems, for this system was a direct outgrowth from his work.

### MR. TAYLOR, THE PIONEER INVESTIGATOR.

In the early eighties, Mr. Taylor, then in the employ of the Midvale Steel Company, became convinced that the scientific method of investigation was the only means of finding the best solution to the various problems with which he found himself confronted; and, whether the problem was that of managing a machine shop or of shovelling coal, he remained firm to his convictions, and did his best to obtain his conclusions by that means. Conscious that his method was correct, he maintained his faith in

the results, no matter how much they differed from previous ones, and often had the satisfaction of accomplishing what had been declared impossible.

The fact that Mr. Taylor combined the knowledge and methods of the scientist with the experience of a practical mechanic, enabled him to bring to bear the scientific method on ordinary mechanical problems in a most efficient manner, and his experiments to determine the laws that govern the cutting of metals is most noteworthy, inasmuch as he not only had to investigate a problem having a large number of unknown quantities, but had to develop a method of investigation of a problem which had been declared by engineers and mathematicians alike incapable of solution. That the problem has been solved, at least in part, is evidenced by the fact that slide rules embodying the laws of cutting steel have been in practical operation for more than two years.

### THE OUTPUT OF MACHINE SHOPS DOUBLED.

This investigation has had, aside from its main object, a most important result, for it has developed a method of making in a few hours a scientific determination of the value of a tool steel for any given purpose; this very important art has in the past been so imperfectly understood that as a rule tool steel has been sold more by the merits of the salesman than by its own. With the new ideas this condition will before long be a thing of the past, and opinions will give place to facts. Again the application of the scientific method to the investigation of ordinary mechanical problems has often disclosed facts previously unsuspected. Most notable among

these was the discovery made by Messrs. Taylor & White in testing tool steel, that certain kinds of self-hardening steel had an important property previously unsuspected. By taking advantage of this property, and making use of it under a proper system of management, it is possible to practically double the output of a majority of the machine shops in the world.

#### THE SCIENTIFIC STUDY OF WHAT A MAN CAN DO.

The value of scientific knowledge to engineering and industry has long been recognized, and the great advances that have been made in this country and in Germany are due largely to the fact that such knowledge has been applied; but the idea of making a scientific study of what a man or a machine could do was new, and so complicated that few looked upon it with favor.

A workman was allowed to do the best he could with the appliances he liked, and a machine or a tool was expected to do what its builders claimed for it. An effort to get more work out of a man or a machine had been made by paying for the amount of work done instead of for the time taken; in other words, by the introduction of piecework in place of daywork; but the knowledge of how much a man or a machine could do was so vague that piece prices set by records or "judgment" were invariably found to be wrong, and the attempt to change them has caused more labor trouble than all other causes combined.

Eliminating, then, the method of setting piece rates by "judgment" and by previous records, the method of investigation or experiment was the only one from which anything could be hoped. No two men worked exactly alike, and few used exactly the same tools. The capacity of a machine and the best method of operating it were seldom what its maker stated. That there is a best method of doing a piece of work, or that there is a best method of operating a machine, and a maximum capacity for that machine, are not doubted, but the problem of determining them was something for which there was no guide except the general principles of scientific investigation.

#### A GREATER OUTPUT, AND GREATER REWARD, OF LABOR.

Believing firmly that if piecework is to be permanently successful the rates must be properly fixed in the beginning, and not "cut," Mr. Taylor undertook to determine by the above method the amount of work to be expected, and fixed his piece rates accordingly, with the result that men provided with the proper appliances, educated in the best methods, and given a piece rate that was

permanent, have produced a greater output at much less cost than under the older method, at the same time earning larger wages.

The difficulty about this method is that the investigation is often long and tedious, for no permanent rate should be set until we know the best method of doing the work, and the exact time it will take a good man to do it.

For financial reasons it is frequently impossible to wait for a complete scientific investigation of every condition before fixing a rate of pay, and the need of a means of making use of a partially completed scientific investigation, or of what knowledge we have, has long been felt. Piecework will not do it satisfactorily, for it is not desirable, or even feasible, to change rates frequently, as the workman never feels settled, and is continually afraid of having his wages reduced. This unsettled feeling, which always accompanies the old-fashioned method of rate setting, is the source of the opposition to that type of piecework, and the reason why so many men prefer daywork at smaller wages.

The first requirement, then, of any system aiming to take advantage of a partially completed investigation is that, no matter what other changes are made, *the workman's weekly pay shall not be reduced.*

#### THE LAWS GOVERNING THE OUTPUT OF LABOR.

It is a well-established fact that a man who is working at day's wages never does work to his maximum capacity, but will do so if he can be sure of earning a commensurate additional compensation. If the work is light, and does not require much physical effort, this additional amount may be as low as 30 per cent. of his day rate. If, however, the work is hard labor, and he becomes physically tired at the end of the day, he requires 50 per cent. additional to make him put forth all his energies; and if, in addition to the physical strain, the conditions under which the work is done are unpleasant, such as severe heat, he requires 70 or 80 per cent. additional to make him do his best.

#### THE WORKING OF THE "BONUS SYSTEM."

These facts, which have been established by history, enable us to take advantage of the results of a partially completed investigation; for, if we set for a day's work such a task as our investigations prove can be done, and offer for its accomplishment the proper premium or "bonus," in accordance with the facts just stated, we shall find a very large proportion of men ready and willing to do the work in the manner and time specified in order to earn the increased pay. This, then, is the 'bonus system,' which we

# IMPROVED CONDITIONS IN THE AMERICAN FARMER'S LIFE.

BY CLARENCE H. MATSON.

FOR several years students of social and political problems have been discussing the tendency of rural communities to rush to the cities and the impending evils resulting therefrom. They have watched with alarm the manner in which urban populations have increased at the expense of the country, and they have sought a solution to the problem of how best to stop it.

But like many another vexatious question, this one bids fair to solve itself. In the East the well-to-do are beginning to leave the cities and are seeking rural homes. They are realizing that the city saps their strength and vitality, which can best be regained "next to the soil," living in the open air of the country and in contact with trees and birds and flowers.

In the West still more potent influences are beginning to keep the agricultural classes on the farms. The forces that impelled the country boy to the city to seek his fortune are losing their power. This wonderful twentieth-century development of ours is bringing about a revolution in farm life. The farm telephone, rural free mail delivery, the traveling library, and rural school consolidation are tending to make farm life more attractive, and remove from it many of its objectionable features.

The chief cause of the exodus from country to city has been the isolation and loneliness of farm life. Especially has this been true in the West, where farms are large and neighbors are far apart. The majority of the inmates of the insane asylums in some Western States are women; a large per cent. of them farmers' wives, sent to the insane hospitals, according to medical experts, by the melancholy induced by isolation. The farmer's children have felt this influence too. They have usually been compelled to help about the farm work during the day, and when night came they had little in the way of books and papers to amuse them, and neighbors were too far apart for frequent gatherings. The monthly trip to the county seat allowed them was a great event to the children, and it is little wonder that they found the town attractive. As they grew older the fascination of town life grew upon them. Sometimes they were sent to the town to attend the graded school, and this increased the irksomeness and loneliness of the farm

when they returned to it, with the result that the boy left the farm to seek his fortune in the city.

But now all this is changing. Rural free delivery of the mails is taking daily papers and illustrated magazines into the farm homes. The telephone is connecting neighbor with neighbor and with the surrounding towns. Late books follow the magazines into the homes of those who can afford them, and the traveling library supplies those who cannot purchase the books. The consolidation of rural schools, while only in its incipient stage, gives promise that it will supply the boys and girls of the farms with the advantage of a high-school education without the necessity of leaving their homes.

In discussing these new conditions in the West, I shall speak primarily of my own State, Kansas, because I am more familiar with the changes in farm life in that commonwealth.

## RURAL FREE DELIVERY OF MAIL.

Four years ago there were only three rural delivery routes in Kansas, and they did not amount to anything. At that time the Post-Office Department determined to give the free delivery of the mails in the country a thorough test. To-day there is scarcely a county in the State, except the cattle-range country of the extreme western portion, that has not from three to twenty routes. In some counties practically every farmer has his mail delivered to him daily, even though he lives ten miles from his post-office, and those communities which are not already served are clamoring for an extension of the service.

For the little sum of two cents the United States Government will carry a letter from New York to Kansas and place it in the hands of the farmer to whom it is addressed, perhaps out in his cornfield miles away from his post office, and all within the shortest possible time. Under the new system, without leaving his farm the farmer can buy a money order and send it East for a year's subscription to a magazine, or for some article which has caught his fancy. This system has been a wonderful help to the mail-order book business. The rural delivery carrier has brought the farmer into the habit of reading and writing more than formerly. A few years ago the writ-

first introduced by the writer in the works of the Bethlehem Steel Company. It consists of teaching an ordinary workman to do a piece of work by the best methods we can devise, and asking him to do it in the time it would take a good workman. If he accomplishes the task in the time set, he is given the wages of the good workman; otherwise he gets simply his own day rate. Aside from the educational effect, which is most marked, the result of this is that many ordinary workmen, who lacked only incentive, promptly take their place among those that naturally have more ambition, and the general moral tone is elevated.

When we write out a set of instructions according to the results of a partially completed investigation, the remaining information will, in the long run, generally be found out either by the expert who is making the investigation or the workman. In the first case, a new set of instructions is made out in accordance with the additional information and the proper bonus set. In the second case the same thing should be done, but in addition the workman discovering or devising the improved method should be given a cash compensation commensurate with the value of the improvement, which should thereafter belong to his employer. By such a system the workman is encouraged to be something more than a machine, for he is first taught the best knowledge available, and paid for learning more.

#### THE ADVANTAGES TO WORKMEN AND EMPLOYER.

Add to the satisfaction that comes with increased wages honestly earned, increase in quantity, and, as experience has shown, improvement in quality of work at a lower cost, and we have a condition that rapidly tends toward prosperity for all concerned.

As in any manufacturing establishment it is important to obtain the maximum output from the plant, it is very essential that the maximum product should be gotten from every machine, and the fact that a man loses his bonus when he fails to get out this maximum product is a very big factor in accomplishing the desired result, for he learns to take care of his machine or tools, and complains promptly if his work is interfered with.

Again, those who are indirectly connected with the output, such as foremen, men who supply material and appliances, and those who repair machines, all should receive a bonus in proportion to the number of men that produce the maximum output, and the whole makes a system that is as nearly automatic as is possible; for what is for the good of one is for the good of all, and a man who will not do his duty soon finds that he is in the wrong place.

#### EXACT BOOKKEEPING FOR LABORING OPERATORS.

This description of the principles on which the bonus system is founded gives but little idea of how it is carried out, but a very little thought shows that proper appliances for doing the work and a complete and exact system of time and record keeping are the first essentials. Thanks to the recent advances made in the art of doing such work, an exact system of keeping time, records, and costs can to-day be made a source of economy by preventing the errors and waste which always go with those methods which depend upon verbal reports and memory.

It has long been the custom to keep a daily record of cash, which must balance to a cent. Modern methods require that we shall keep a daily record of labor and material, and the bonus system in its best development compels a modern system of management in that it requires that we shall at all times know the work done and to be done, and the means for doing it. Such a system requires that work for men and machines should be laid out as fully as possible the day before, which has a strong tendency to do away with delay and idleness, which are expensive alike to the manufacturer and the bonus workman.

That such a system requires more organization than the ordinary shop possesses is not denied, but few realize how little such organization costs, and how many times it pays for itself in the course of a year.

#### OUTPUT OF THE BETHLEHEM COMPANY DOUBLED.

The principles above outlined were applied during the spring and summer of 1901 to the ordnance and armor-plate machine shops of the Bethlehem Steel Company, and resulted in a short time in more than doubling the output of those shops. The system is still in use substantially as introduced, and the superintendent, Mr. Archibald Johnston, in his testimony before the House Committee on Labor, February 13, 1902, makes the following statement regarding it: "This arrangement has worked very satisfactorily, both to the men and the company, for it has enabled us to get work out more quickly, and to add to the producing capacity of our invested capital; while for the men it has been a great benefit, as we have many instances of employees who have bought homes for themselves principally from their extra earnings on the bonus system, and from overtime work. *The system has been a stronger incentive to industry than any other we have been able to put into effect in our plant.*"

The cause of this result is not hard to find, for the men, realizing that their interests are being cared for, give their coöperation.

# IMPROVED CONDITIONS IN THE AMERICAN FARMER'S LIFE.

BY CLARENCE H. MATSON.

FOR several years students of social and political problems have been discussing the tendency of rural communities to rush to the cities and the impending evils resulting therefrom. They have watched with alarm the manner in which urban populations have increased at the expense of the country, and they have sought a solution to the problem of how best to stop it.

But like many another vexatious question, this one bids fair to solve itself. In the East the well-to-do are beginning to leave the cities and are seeking rural homes. They are realizing that the city saps their strength and vitality, which can best be regained "next to the soil," living in the open air of the country and in contact with trees and birds and flowers.

In the West still more potent influences are beginning to keep the agricultural classes on the farms. The forces that impelled the country boy to the city to seek his fortune are losing their power. This wonderful twentieth-century development of ours is bringing about a revolution in farm life. The farm telephone, rural free mail delivery, the traveling library, and rural school consolidation are tending to make farm life more attractive, and remove from it many of its objectionable features.

The chief cause of the exodus from country to city has been the isolation and loneliness of farm life. Especially has this been true in the West, where farms are large and neighbors are far apart. The majority of the inmates of the insane asylums in some Western States are women; a large per cent. of them farmers' wives, sent to the insane hospitals, according to medical experts, by the melancholy induced by isolation. The farmer's children have felt this influence too. They have usually been compelled to help about the farm work during the day, and when night came they had little in the way of books and papers to amuse them, and neighbors were too far apart for frequent gatherings. The monthly trip to the county seat allowed them was a great event to the children, and it is little wonder that they found the town attractive. As they grew older the fascination of town life grew upon them. Sometimes they were sent to the town to attend the graded school, and this increased the irksomeness and loneliness of the farm

when they returned to it, with the result that the boy left the farm to seek his fortune in the city.

But now all this is changing. Rural free delivery of the mails is taking daily papers and illustrated magazines into the farm homes. The telephone is connecting neighbor with neighbor and with the surrounding towns. Late books follow the magazines into the homes of those who can afford them, and the traveling library supplies those who cannot purchase the books. The consolidation of rural schools, while only in its incipient stage, gives promise that it will supply the boys and girls of the farms with the advantage of a high-school education without the necessity of leaving their homes.

In discussing these new conditions in the West I shall speak primarily of my own State, Kansas, because I am more familiar with the changes in farm life in that commonwealth.

## RURAL FREE DELIVERY OF MAIL.

Four years ago there were only three rural delivery routes in Kansas, and they did not amount to anything. At that time the Post Office Department determined to give the free delivery of the mails in the country a thorough test. To-day there is scarcely a county in the State, except the cattle-range country of the extreme western portion, that has not from three to twenty routes. In some counties practically every farmer has his mail delivered to him daily even though he lives ten miles from his post office, and those communities which are not already served are clamoring for an extension of the service.

For the little sum of two cents the United States Government will carry a letter from New York to Kansas and place it in the hands of the farmer to whom it is addressed, perhaps out in his cornfield miles away from his post office, and all within the shortest possible time. Under the new system, without leaving his farm the farmer can buy a money order and send it East for year's subscription to a magazine, or for some article which has caught his fancy. This system has been a wonderful help to the mail-order book business. The rural delivery carrier has brought the farmer into the habit of reading and writing more than formerly. A few years ago the writ-

vantage, for he can personally solicit trade at any time he wishes, and he can use the rural mail carrier as his "delivery boy," sending out the goods the same day the order is received.

#### TRAVELING LIBRARIES.

Along with rural delivery and the farm telephone, but having no connection with them, has come the traveling library. Kansas was one of the first States to adopt this new idea for the improvement of rural life. That was less than four years ago, but now a large percentage of the States of the Union have traveling libraries in some form.

The people in the cities and larger towns generally have access to public or circulating libraries, but for years it has been a problem how to extend the same privilege to the residents of agricultural communities. The traveling library is designed to solve this question. Any country lyceum or club can secure a library of fifty books, free of cost, by applying to the librarian in charge of the traveling library, who is now a State officer in Kansas. A library may be kept in one community for six months if desired. It is then returned to the librarian, and another, containing an entirely different assortment of books, may be secured. One library will furnish a winter's reading to a rural community.

In Kansas the club women inaugurated this movement, but it proved of such great benefit that after one year the State Legislature took it up and made it a State institution. It now consists of upward of one hundred libraries, of fifty books each, and it is being added to as fast as legislative appropriations become available.

#### CONSOLIDATION OF COUNTRY SCHOOLS.

The educational problem in rural communities is still unsolved to a great degree. Heretofore it has been customary to send the more ambitious children, whose parents could afford it, to the graded school in town after they have passed through the district school, where perhaps the school term was only five or six months long. Sometimes this has furnished a strong incentive to the farmer to leave the country and move to the town or city, in order that his children may have the best in the way of educational advantages.

While it is still a new idea to many people, the consolidation of rural schools bids fair to bring directly to the farm the educational advantages of the town. The plan has been tried in a small way in Ohio, in Iowa, in Kansas, and in

other States, and it has been remarkably successful. The last Kansas Legislature passed law to make the plan general wherever communities desire it, and Prof. Frank Nelson, State superintendent of public instruction, has made his special work to encourage the adoption of the plan. Superintendent Nelson has become the apostle of school consolidation in Kansas.

Several years ago four school districts around Lorraine, Ellsworth County, Kan., were consolidated, and a central schoolhouse was built in the village of Lorraine. After the consolidation three teachers did the work which required formerly, and as the school was graded they did it better. Some of the children lived several miles from the schoolhouse, but they were transported to and from school in covered spring wagons at the public expense. Last year a two years' high-school course was added to that of the common school, and now the entire cost of maintenance is but little more than that of the four separate districts before the consolidation. The extra expense is largely due to the transportation of the pupils. To offset the small additional expense the term is considerably longer. The work much better done, the high-school course has been added, the schoolhouse is much more sanitary, and the advantage of transporting the children to and from school, especially in bad weather, can scarcely be estimated. The consolidation idea is growing rapidly in Kansas, and movements to consolidate rural districts are now under way in many counties in the State.

#### EASING THE BURDENS OF LIFE ON THE FARM.

These are some of the main reasons why farm life is more attractive in the West than it was a few years ago. There are other minor ones. With increasing knowledge and intelligence the farmers are putting more of science into the work. Improved machinery is making the farm work lighter. The well-to-do are establishing acetylene gas plants in their homes, alleviating the heavy housework which falls to the lot of the farmer's wife. The gasoline engine, too, is supplying the place of the city waterworks.

There will doubtless always be a certain flow from the country to the city. It should be so. The city needs the vitality and strength of the country boy. But the rush from the farm to the large centers of population, to escape the hardships and isolation which have been a part of farm life in the past, will probably cease to a great degree.

# THE FARMER'S BALANCE SHEET FOR 1902.

BY WILLIAM R. DRAPER.

**T**HE season of greatest activity upon the farm has ended, and now the agriculturalists of this country are beginning to compute their profits for 1902. Wheat has all been harvested, corn is matured beyond the point of danger, and other cereals are safe for the season. Pasturage was never in better shape for the grazing herds, and only the cotton crop seems to be seriously affected. Cotton is not so badly drought-bitten but that the growers can come out with a handsome profit.

## VICISSITUDES OF THE SEASON.

A few weeks prior to the wheat harvest the usual cry of hot winds and droughty conditions in the grain belt went forth, but when the harvest came it was found that wheat was safe. In the Northwest wheat harvesting was delayed by heavy rains, and along the north Pacific coast considerable, but not serious, damage was done to grain in the shock. In the Southwest the harvest progressed without a hitch, so far as favorable weather was concerned. The principal difficulty was in securing sufficient harvest helpers. The spring wheat crop, which is the principal one of the Northwest, was considerably damaged by hail in the Dakotas. Notwithstanding this slight interference the condition of wheat, as viewed by government experts, gradually improved as the season came to an end. Nebraska, this year, claims the largest wheat yield per acre. This record was previously held by Wyoming.

During the early part of August a hot wave struck the corn fields of Kansas, and threatened to burn them before the ears had matured, but the intense heat lasted less than one week, doing less than 3 per cent. damage to growing corn. Cool weather and general rains followed, and the corn is now safely matured. As a whole, the corn made excellent and unhampered progress throughout the growing season. This record of weather conditions is unusual.

Early in August the cotton crop began to improve, and there is a possibility that the drought, shredding, and rust which threatened to wipe out the profits of cotton growers of the South will not, after all, seriously affect the result.

## ONE OF THE "RECORD" CROP YEARS.

This has been one of the best "good all-around" years in the history of agriculture.

Wheat was blighted in portions of the country in early spring and during the past winter, while heavy rains during July damaged the corn to some extent in the Lake, upper Mississippi, and lower Missouri regions. But otherwise the crops have been attended and assisted by favorable rains and sunshine throughout the growing seasons. As always, the scare of a ruined wheat crop was started in early summer, but it was found after harvest that the crop had fallen short of last year's enormous wheat yield by 50,000,000 bushels, while corn for 1902 exceeded the crop of 1901 by 1,000,000,000 or more bushels. Other cereals will be above the ten-year average.

The Northwest is producing the largest crop of wheat, barley, oats, and flax ever recorded, while Kansas is coming forward with a "bumper" corn crop; even in excess of 1889, when corn was burned for fuel and sold at 10 cents per bushel. As a result of the bounteous harvest, a bearish feeling possessed the speculators, and grain "sold off" steadily. Once the "corner" in corn and oats had been broken the market took the natural downward trend.

## THE TRANSPORTATION PROBLEM.

The railroads entering the great corn and wheat belts, instead of offering reduced rates to ship, in the grain, as was made to some drought-stricken communities in 1901, will be overtaxed in hauling the cereals to market.

Farmers along the Pacific slope won a decisive concession from the transportation companies prior to Eastern grain shipments this season. A flat cut of 10 per cent. in freight rates on wheat was made by a number of the trunk lines. The farmers asked for a deduction of 33 per cent., but under the new arrangement the wheat growers of Oregon, Washington, and California will increase their profits 3 cents per bushel. This will be a saving of hundreds of thousands of dollars to the Western grain growers.

## THE YIELD OF CEREALS.

Cereal crops for the year of 1902 have not all been gathered, but experts have reported upon their yield, and these approximate reports, submitted several months ahead of the Government reports, have proved very nearly exact in the past. Approximately stated, the yield is as follows: Wheat, 700,500,000 bushels; corn, 2,589,951,-

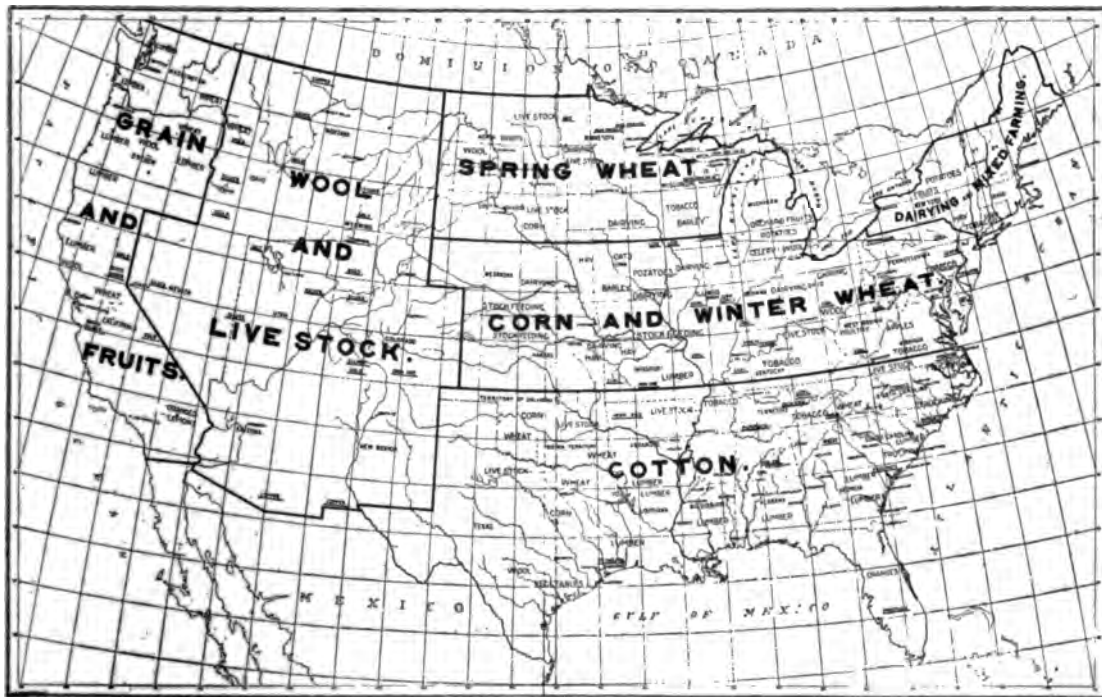

000 bushels ; oats, 860,000,000 bushels ; barley, 120,850,000 bushels ; rye, 30,350,000 bushels. Thus a total of 4,351,851,000 bushels of cereals were produced on 841,000,000 acres, to say nothing of the farming land used for other crops and for pasture land, barnyards, etc. Prices obtained by the farmers for the cereals differ every year. Last year, for instance, there was a shortage in corn, and it sold for 60 cents a bushel on the farm. The history of corn has been that during such plentiful seasons as this one the average price is 30 cents per bushel. At that rate 1902 corn will bring to the farmers \$776,985,300. Wheat prices are governed accordingly. All other things considered, wheat will bring 60 cents to the farmer during 1902,—that is, he will have realized that amount by general consideration of wheat on hand, the shortage, etc., and at this figure the wheat crop will net \$580,100,000 to farmers. Oats, if sold at the present market price, will bring \$350,500,000 ; barley, \$52,750,000 ; rye, \$15,909,000, or a total of \$1,776,244,000 for cereals alone. The cotton crop is worth this year about \$500,000,000, while the hay, including alfalfa, is worth the same amount to the farmer. Potatoes will sell for \$100,000,000, while the buckwheat crop is valued at \$8,000,000. There have been other years when cereals sold for more ; last year the corn crop, though

one-half as large as in 1902, sold for \$921,555,768. But the farmers did not hold much of when it went to 65 cents, so they were not benefited. The selling price at harvest time can generally be accepted as the farm price.

THE PRODUCT COMPARED WITH THAT OF FORMER YEARS.

Approximately the earnings of the five and two-thirds million farms of the United States were, for 1902, five and one-fifth billion dollars. This is far in excess of the total income of the farmers at any other time in their history. The products of the farms for 1899 sold for \$4,739,118,752. The cereals, save corn, are about equal to the crop of 1899. This year, 500,000,000 bushels more corn and several hundred thousand head of steers in excess of three years ago were placed on the markets. And one should also remember that the number of farms is continually increasing at a rate of from fifteen to forty thousand annually.

The corn crop of the world for 1900 was 2,882,900,000, the corn crop of the United States for 1901 was 1,522,518,000 bushels while the corn crop of the United States for 1902 is slightly in excess of the 1900 crop of the entire world. This year 94,869,928 acres were planted in corn, principally in Illinois

MAP SHOWING THE DISTRIBUTION OF CROPS IN THE UNITED STATES.

Iowa, Missouri, Kansas, and Nebraska. Illinois exports more corn than any other State, or 35,000,000 bushels in 1901. On March 1 of the present year much of the crop of 1901 was held and sold during the spring at 60 and 70 cents per bushel, excessive prices indeed. When the first corn was being gathered in the West the market price in Chicago was 67 to 70 cents.

The average yield per acre in 1901 was 16 bushels; this year, 30. The wholesale price of corn on December 1, 1901, was 72 cents, and in May it touched the high-water mark at 80. There was a corner in corn in July, but this did the farmers little good. Their bins were sold bare before that time.

#### THE WHEAT CROP.

The average yield of wheat, since a report has been kept, is 15 bushels per acre. In the Southwest, Turkey red wheat has been known to run 40 bushels per acre, and certain expert wheat growers have a system of drought-proof planting which yields 25 bushels. The greatest average of wheat for one State is reported from Washington, with 29 bushels per acre for 1901. Last year 375,000,000 bushels of wheat were exported, there being an overproduction of 200,000,000 bushels above the general average. Farmers in 1901 cleared \$205,000,000 on wheat alone. On July 1 of the present year the farmers held in their granaries 52,000,000 bushels of old wheat. The 1901 crop sold for \$467,350,156, as against \$580,100,000 for 1902. The shortage in bushels of wheat this year was more than accounted for in price. Several million acres of wheat were entirely frozen out during the winter, and this land was ploughed up and sown in corn. But the crop turned out much better at harvest than it was expected to do. Clear dry weather for three weeks prior to cutting time assisted the grains in development. The wheat crop of the world for 1900 was 2,873,000,000 bushels.

#### PRESENT STATUS OF THE FARMING INDUSTRY.

There are 10,438,922 persons engaged in agricultural pursuits, while all other industries engage 18,845,000 persons. One-third of the entire area of this country is devoted to tilling of the soil. There are to-day 5,739,657 farms in the United States, and the value of farm property, including improvements, stock and implements, is \$20,514,001,838. The number of farms has quadrupled in the past fifty years, while the value of the farming land to-day is five times as great as the selling price of fifty years ago. More than 1,000,000 farms have been laid out and fenced in by settlers, principally in the West, in the past ten years. Fifteen thousand farms were

given away by the Government during 1901. When the Indian Territory is opened for settlement, about 1904, 8,000,000 acres of fine farming land will be offered for sale at low prices, and farming will receive another valuable acquisition to its ranks. There are 306,000,000 acres of unsettled land in the United States ready for immediate occupancy.

The total acreage used for farming purposes is 841,000,000 acres,—an area which would contain England, Scotland, Ireland, Wales, France, Germany, Austria, Spain, Japan, and the Transvaal, leaving sufficient room for several smaller countries to go in around the edges. None of these countries, or all of them combined, would make a respectable showing with our agricultural products. The value of farm exports in 1901 was \$951,628,331.

#### THE FOREIGN MARKET.

The supply of farm products sold abroad is increasing every year. In 1900, according to the Secretary of Agriculture, the amount was \$950,000,000. For years there have been objections raised in the East by farmers against the reclaiming of the arid lands of the West. A reason was offered that the supply would exceed the demand. Experts scout this idea, and say that the new foreign markets being opened, principally in Asia, will absorb the surplus of farm products of the West, no matter how excessive over previous yields. One difficulty in raising farm products with profit on the Western slope is high transportation rates to the Eastern seaboard. James J. Hill, president of the Great Northern Railway, recently said of undeveloped trade in the Orient:

There are a thousand million people off our Pacific coast, with only three million farmers on the Pacific slope to reach out for their trade. To develop this trade national irrigation is necessary, and is the one thing needed to give the United States dominant power of the Pacific Ocean commerce and supremacy of the world's trade in farm supplies. Every business interest benefits by irrigation.

Thus it will be readily seen that the possibilities of farming in the United States have not half been accomplished. But public lands have been opened at a rapid rate since 1892, 112,294,681 acres having been disposed of by the United States, principally to farmer-settlers.

#### FARM LABOR.

While farming is yielding large profits to the owners, what of the farm workers? In 1900 there were 5,321,087 daily wage earners in the United States. Of this number 1,522,100 were regularly employed farm "hands," working by

the day or month, exclusive of farmers who own and operate their farms. The scale of wages paid them is from 80 cents to \$1.25 per day, or \$20 to \$25 per month and board. The wages for helpers, extra and regular, amounted to \$365,505,921, while the value of farm products was over \$4,700,000,000. The average expense for each farm, so far as the labor is concerned, was \$64 in 1899, while the average value of the products per acre was \$4.47. White farmers paid more for their help, on an average for each farm, principally because their farms were larger. Approximately each white farmer paid \$71 for his hired help throughout the year. Of course some of these farmers did not hire any help at all, harvesting their grain in midsummer alone. But, on the other hand, some of the "big" farmers of the corn and wheat belts paid out from \$100 to \$500 daily for helpers during the garnering seasons. It costs more to run sugar farms, \$1,985 being paid for each plantation of this kind which harvested a crop in 1899. In 1889, the price paid for the running of various cereal and produce farms is given by the Census Bureau as follows: per farm, wheat and grain farms, \$76; cotton, \$25; tobacco, \$51; nurseries, \$1,136; vegetable, \$106; dairy, \$105.

Besides the regular number of farm helpers,

about 100,000 are employed in addition during the wheat-cutting season in the grain belts. These are known as harvest hands, and are paid from \$1.50 to \$3.00 per day. These harvest hands are now forming themselves into unions for their own protection from overwork and low wages. Many labor unions for regular farm hands are being organized in Indiana, Ohio, Kansas, and the Southwest. The young man who has made his home on the farm year after year is paid less than any other class of workers. He has had longer hours and no vacations. He has brought to his employer larger returns for the work than the coal miner, the steel worker, or the mechanic of ordinary skill. The total expense, for instance, on an acre of wheat is \$6. Of this \$4.10 goes for horse hire, twine, seed, etc., while the remainder is paid to the two men who gather it and the one who ploughs the soil and sows the grain seeds. The profits upon their \$1.90 worth of labor yield from \$5 to \$8 to their employer. Corn is produced for \$5.85 per acre, of which \$2.25 goes to the man and his team. Generally the horses are owned by the farmer, and the man is getting \$20 per month. The duties and wages of the farm hand of to-day, it may be seen, are not commensurate with the profits of his employer.

## THE DIFFUSION OF AGRICULTURAL PROSPERITY.

BY PROFESSOR HENRY C. ADAMS.

THE marked prosperity which has attended the industry of agriculture during the past few years has been the occasion of many comments respecting its industrial and social significance. In a general way, it is understood that all members of society are partakers of this prosperity. It is one thing, however, to concede in a general way the proposition that the commercial success of one class or interest must diffuse itself throughout the community; it is quite another thing to see clearly in what manner, and under what conditions, this diffusion takes place. Indeed, it is by no means easy to appreciate fully the extent of the mutual dependence of classes and interests in a country whose industrial organization is like that of the United States.

There was a time when the chief significance of agriculture lay in the fact that it provided

raw material and food for those engaged in manufacture and trade. This must, of course, ever remain an important service of agriculture, but it fails to suggest the chief significance of the prosperity of the farmers at the present time. Of greater relative importance is the fact that a series of successful years in the industry of farming increases the purchasing power of a vast body of intelligent men and women whose homes are scattered throughout the length and breadth of the land. It is through this increase in ability to buy goods that the prosperity of its rural districts makes itself felt, for this presents to the manufacturer a commercial motive to employ labor and capital in producing the goods which the farmers demand.

It is doubtless true that this relation of the agriculturist to the manufacturer is in a degree a

reciprocal relation. At whatever point one breaks into the circle of trade he may observe the current of exchanges to move in both directions. The manufacturer buys from the farmer as well as the farmer from the manufacturer. All permanent and healthful exchanges are at last analysis reducible to barter. But while this is true, it is also true that any series of activities must have a beginning, and both analysis and observation lead to the conclusion that the initial step in creating a circle of successful trade must be taken by those producers who, from the nature of their occupation, deal with the primal factors of consumption. The manufacturer will produce nothing unless he sees, or thinks he sees, a market for his goods, for neither he nor his laborers care to consume the things they make. The merchant and the transporter, also, await the appearance of a visible demand before expanding their enterprises. The farmer, on the other hand, will plant and reap whether there is a strong demand for his produce or not. The condition of the market may influence the kind of seed sown, but it will not, at least for a considerable number of years, influence the extent of the sowing. This is why, after a period of commercial depression, the manufacturers and the merchants are more anxious even than the farmers themselves for good harvests and good prices.

#### THE CONSUMER'S POINT OF VIEW.

In what way, then, does a bountiful harvest under propitious conditions of the market diffuse itself throughout the community? To answer in a sentence, this diffusion takes place through the agency of the motive which a prosperous condition of agriculture presents to the manufacturer and the merchant. The prosperity of agriculture is the center of that spontaneous activity which, when extended to the entire field of human wants, results in what is known as "prosperous times." Thus, a series of bountiful harvests is the starting point of recovery from commercial depression. Other facts there are, without doubt, that should be embraced in a complete explanation, but success in agriculture is the initial factor; it is the fundamental fact. We gain the correct point of view from which to analyze industrial interdependence when we consider it from the point of view of consumption.

While it is true that the above analysis holds for all peoples and all countries, there are certain reasons why it bears a peculiar significance for

the United States. In the first place, notwithstanding the marvelous development of manufactures, this country is still an agricultural country. Success in agriculture touches the lives and interests of a large portion of the population. It means a rise in the scope and standard of demand of a very considerable number of people, and results in the strengthening of a home market of such proportions as to furnish, quite independently of foreign markets, an adequate motive for the development of manufacture and trade. From the point of view of consumption the significance of an industry is measured, not by the amount of capital invested, but by the number of consumers which it supports.

#### THE FARMER'S ECONOMIC STATUS.

The intelligence of the agricultural classes in this country, also, is a fact of equal importance, for widespread intelligence is essential to the elasticity of commercial demand. The American farmer does not hoard his cash. He does not, like the peasant of southern Germany, know the system of "blue stocking" banking. Prosperity for him means a rise in the standard of living, or an improvement in the equipment of production, either of which constitutes an effective demand for the labor of the non-agricultural classes. And, finally, it should be observed in this connection that the American farmer is, as a rule, his own landlord. This makes an immense difference in the extent to which agricultural prosperity is diffused throughout the community. Being his own landlord, he receives as a portion of his income the rent that accrues on his land. This not only puts at his disposal a larger sum of money to be expended, but it places the expenditure of this amount in the hands of a class whose demands are for a large quantity of common, ordinary goods. This of itself is a significant fact, for a moment's consideration makes it evident that an increase in the available wealth of a small aristocratic class must be followed by relatively slight industrial consequences as compared with the results of a diffusion of an equal amount among a large body of intelligent consumers. Thus, from every point of view, American agriculture is in a condition to control in large measure the industrial activity of the American people. The prosperity of the farmer, if not synonymous with the prosperity of the nation, is an essential for widespread industrial activity.

## A GIANT AUTOMOBILE HARVESTER AT WORK.

**A**MONG the products of California wonderful for their bigness is a combined automobile harvester and thresher, now at work on the Pacific slope, doing its part toward garnering the great crops of 1902.

This "department store" harvester includes and is propelled by an automobile having a 30-horse-power engine. The reaper cuts a swath 36 feet wide; the barley heads are caught on a moving belt 48 inches wide, and carried to the threshing department of the machine. A half minute after the boss sings "all right," and the Juggernaut begins to move, grain comes pouring into the thresher's bin, not only shelled, but carefully cleaned. The grain is transferred immediately to sacks, which are sewed and removed from the machine as soon as twelve are filled.

This mighty product of American machine-

making is 66 feet long, weighs over 100 tons, and cuts and threshes under favorable conditions as much as 100 acres a day. Four horses are in constant use supplying it with fuel oil and boiler water. It defies hills of any reasonable grade, and travels at an average rate of three and a half miles an hour. The great wheels prominent in our picture have tires 4 feet wide, with ridges  $1\frac{1}{2}$  inches high.

These harvesters are made near Oakland, in California. Men that farm on a large scale come from neighboring States, and from as far east as Kansas, to see the machine at work. Three giants of the same type were made in California and sent to Russia for use on the great grain fields of the Steppes, but the train carrying them was seized by the Boxers and side-tracked for two years.

# "FIXING" NITROGEN FROM THE ATMOSPHERE.

BY THOMAS COMMERFORD MARTIN.

**E**XHAUSTION of the world's supply of coal is being appreciably retarded by the electrical utilization of hitherto wasted water powers. At no distant date it may be further checked by the corresponding employment of the tides of the air and the sea. In like manner, there now emerges the possibility of maintaining indefinitely by electrical methods, for the enormous benefit of the progressive civilized races of the world, the supply of fertilizers necessary to insure steady and abundant food. Many readers of the **REVIEW OF REVIEWS** will remember the alarm caused in 1898 by the British Association address of Sir William Crookes, on the serious extent to which the world's wheat supply is threatened by the failing fertility of the available soil. A profound sensation was caused everywhere by that remarkable analysis of the situation. Strenuously controverted as his pessimistic assertions were, they remain broadly true; and may here be summed up in the statement that the world's low average of less than thirteen bushels per acre means literal starvation for the rapidly increasing nations of wheat eaters, unless by large access to cheap nitrogenous manures the quantity can be considerably bettered. The Caucasian has, indeed, consumed fertilizers even more extravagantly than coal and iron.

There are other ways than riotous living to waste one's substance. The nitrate deposits of Chile are swiftly running out. The guano islands are even now cleaned up. The phosphatic beds of the South are quite strictly limited. Normal resources are also squandered with criminal prodigality, and the unrequiting sea is residuary legatee of untold treasure from drains and dumps. In England alone fixed nitrogen worth \$80,000,000 a year is chucked away, while the whole Atlantic seaboard of the United States testifies vividly to every eye and nose of equal waste among ourselves.

A prediction has been made that barely thirty years hence the wheat required to feed the world will be 3,260,000,000 bushels annually, and that to raise this about 12,000,000 tons of nitrate of soda yearly for the area under cultivation will be needed over and above the 1,250,000 tons now used up by mankind. But the nitrates now in sight and available are estimated good for only another fifty years, even at the present low rate of consumption. Hence, even if famine

does not immediately impend, the food problem is far more serious than is generally supposed. The starvation that we assume to be periodically inevitable in such regions as India and Russia, and which is not remote in the history of occidental Europe, looms again on the near horizon of the present century, unless we take to sundry husks that the swine do eat. Perchance, the declining increase of population shown by all recent census returns may stave off that grimly evil day. More probably, as this article will point out, relief may come from the application of new ideas and new forces to new ways of winning food. The benefactors of the race who can get three bushels of wheat where one grew before see their golden opportunity.

Dealing with the conditions as they are, Sir William Crookes pointed to an inexhaustible supply of nitrogen to be dug from the air by industry and ingenuity, with the aid of cheap power in illimitable supply, as at Niagara; and curiously enough, his prophetic surmise is already in actual realization. On every square yard of the earth's surface nitrogen gas, in the air, bears down with a weight of seven tons. What has been demanded is a method that will extract or "fix" this at little cost, and expeditiously, just as it is fixed otherwise by the infinitely minute and slow processes of nature. A building the size of the Carnegie Music Hall, in New York City, holds thus about twenty-seven tons of nitrogen, and if that were taken out of the air, and combined in the form of nitrate of soda, it would be worth \$10,000.

Following up such calculations, Sir William Crookes has estimated that, with the electrical energy of Niagara to burn up the air, nitrate of soda ought to be producible at not more than \$25 per ton. This compares, for example, with Chilean nitrate at \$37.50 per ton, or the nitric acid of commerce at \$80 per ton. Now the greater the consumption of Chilean nitrates or Carolina phosphates the higher the price is driven; whereas, the larger the scale upon which the energy of Niagara is utilized, the cheaper the output of any plant there. The supply of air will be granted to be inexhaustible, and the available energy of Niagara is put at from five to ten million horse power; so that at the spillway of the Great Lakes alone the inventor lays his hand upon all the raw material required for furnishing

under favorable conditions whatever nitrates can possibly be needed, whether for the crops of the world or for various other important uses.

In short, with the aid of electrical-conversion apparatus, there is nothing that Niagara will fail to give us, from manure to diamonds, for just as the carbon crystals have been fixed in the fierce heat of electric furnaces, so now Mr.

MR. CHARLES S. BRADLEY.

Bradley and his associates have fixed nitrogen by a similar combination of forces. As far back as 1785, the famous Dr. Priestly noted the fact that when an electric spark was discharged through it, the air underwent immediately a chemical change. A thunderstorm and the following freshness are an analogue to this. Any one who has stood in the vicinity of frictional electric machines at work has become conscious of the pungent, fresh odor they caused; and the same phenomenon is often noticeable where dynamo-electric machinery is in motion, if the brushes on the commutator spark freely. This smell has been attributed to ozone created by the decomposition of the air and the rearrangement of the oxygen atoms; but it is now thought that it may be due, for the most part, to oxides of nitrogen. In regard to the 1785 experiments, the celebrated

physicist Cavendish said, in the quaint phraseology of the time: "We may safely conclude that the phlogisticated air—nitrogen—was enabled by means of the electric spark to unite to, and form, a chemical combination with the dephlogisticated air—oxygen—and was thereby reduced to nitrous acid; for in these experiments the two airs actually disappeared, and nitrous acid was actually found in this room."

It was, indeed, by following analogous methods that Lord Rayleigh, not long ago, was able to segregate "argon," that hitherto undetected constituent of the atmosphere. With an alternating current arc, he could effect the union of about 29 grammes of oxygen and hydrogen at the expenditure of one horse power. Nitrogen, as is well known, is present in the air in the proportion of about eight volumes to two of oxygen.

Here, then, are the foundation data of a new art; but, as usual, it is a long road from the crude experiment of the philosopher and the vivid dream of the visionary to the evolution of a practical process yielding definite commercial results. We need not wonder that over a hundred years have elapsed between the first observation and the new industrial enterprise founded at Niagara Falls by Mr. Charles S. Bradley and his fellow-worker, Mr. D. R. Lovejoy. There are even now enough philosophical records of unexploited phenomena heaped up to keep all the inventors worth their salt busy all the century

founding new arts and industries on them. The problem before Messrs. Bradley and Lovejoy has consisted mainly in the production of a large number of electric arcs or flames in a confined space, through which a regulated amount of air to be burned could be passed continuously; this air emerging from the apparatus laden with nitric oxides and peroxides, as the result of the com-

MR. D. R. LOVEJOY.

bustion, and ready for treatment and collection. It is almost needless, of course, to add that incidentally they had to attack a number of other difficulties demanding inventive ability of the highest order.

A great deal of time and money had to be spent in determining the form or variety of electric arc-spark that would effect the maximum chemical union of nitrogen and oxygen in the

EIGHT-INCH 10,000-VOLT ARCS BURNING THE AIR.

air. The curious discovery was early made that "static" sparks, such as are caused by the rotation of the frictional glass disc machines seen in medical establishments, are not worth much for this work. In other words, of homely truth and wider range, the process was one needing lots of energy

back of it to do hard work, and not mere pyrotechnics; and static electricity has never yet been of any use to man as a beast of burden.

Turning, therefore, to kinetic or dynamic electricity as obtained from modern generators driven either by steam engines or by water wheels, the two inventors next ascertained that for their work, contrary to the experience of Lord Rayleigh, an alternating current arc was inferior to the direct current arc,—the latter being very much of the kind to be seen on the streets nightly in hundreds of thousands of lamps, whose arc is apparently a shining white bow of light between the two carbon sticks inside the globe.

Up to the present time, an arc-light direct-current dynamo of special winding has, therefore, been used by Mr. Bradley, giving current at the high pressure of 10,000 volts, which is far above anything ever used before in this country, although some direct-current power-transmission has been done recently in Switzerland with machines of 25,000 volts, the strain on the insulation of the machines being very severe.

Supply of current being now obtained from dynamo machinery, the power to operate which comes from Niagara, Mr. Bradley leads it into the nitrifying chamber, where the arcs are to accomplish in an instant results on which it is the custom of Nature to expend long centuries. In

COMPLETE NITRIFYING CHAMBER AND INCIDENTAL APPARATUS FOR BURNING THE AIR WITH ELECTRIC ARCS.

GENERAL VIEW OF ARC MACHINE ON LEFT DRIVEN BY MOTOR AT THE RIGHT, RECEIVING ITS CURRENT FROM NIAGARA POWER PLANT.

the engravings herewith this chamber is shown separately and in assemblage with other parts of the apparatus. It consists essentially of a big box of metal 6 feet high and 3 feet in diameter. Inside is a revolving cylinder, or hollow shaft. The box has openings to admit the air and circulate it, and around its wall are rows of fixed electrical contacts for arcing points, arranged in six rows

of twenty-three each. The positive pole of the dynamo is connected in "multiple" derivation to these by wires, so as to include an inductance coil in each circuit, whose object it is to prevent the arcs from "short circuiting," and burning out, the dynamo. The negative pole or side of the dynamo circuit is connected with the revolving member inside the chamber, said cylinder

VIEW SHOWING TERMINALS USED FOR ARCING AND BURNING THE AIR IN CHAMBER.

having contact projections, or wire fingers, corresponding to the contacts on the shell of the box, so that as it spins around, the currents from the 10,000 volt dynamo arcs cross, as shown, in the air between the stationary contact points and the revolving ones. The arcs are thus rapidly and incessantly made, "broken," and remade within the chamber. A motor at the top of the apparatus drives the cylinder at a speed of from 300 to 500 revolutions per minute, while air is forced into the chamber at the rate of five cubic feet per arc contact per hour. The air leaves the chamber after this treatment laden with  $2\frac{1}{2}$  per cent. of oxides of nitrogen. The wires on the hedgehog barrel in the chamber are tipped with platinum, to minimize wearing down in the intense flame of the arc. They are so set, each a little in advance of the other, as to form spirals from top to bottom of the shaft, enabling the arcs to work on the chambered air without cessation.

If the reader will think of the wire teeth of a music-box drum, and see a spurt of white flame passing every time a tooth is touched by the finger that sets up vibration, he will have a pretty clear idea of the electric arcing that goes on in the nitrifying chamber. The arcs which thus wind spiral-wise around the shaft are themselves six or eight inches long,—thin, white resistless darts of all-consuming flame. This is a very long arc, those in lamps being usually but half an inch. In front of each line of arcing points is an air pocket, at the bottom of the chamber, to catch the decomposed air. Thence pipes lead away which entrain the air and its gases to an absorption tower, where the process is completed.

The absorption or water-sprinkling tower used is of the ordinary kind common to chemical processes, and the result of this treatment is nitric and nitrous acid. If the gases are brought into contact with caustic potash, we get saltpeter; if the base is caustic soda, we get nitrate of soda. Professor Chandler, the distinguished chemist, of Columbia University, New York, in a careful investigation of the process made recently, found that with current at Niagara costing \$20 per kilowatt,—i.e.,  $1\frac{1}{2}$  horse power per year,—the expense for the energy required would be a little less than 1.6 cents per pound of 70 per cent. nitric acid, which is the customary commercial strength of acid selling at 5 cents per pound.

It is hardly to be wondered at that Lord Kelvin, when in this country last April, should say, after witnessing the operation of this initial plant at Niagara Falls: "I saw something there that I have never seen before; in fact, I regard it as the most interesting sight I have witnessed in America on my present trip." It was Emerson's advice to hitch our farm-wagons to a star, but

here are men who use the atmosphere as their milch cow. The tremendous effects possible in agriculture have been suggested above. By way of confirmation, let it be noted that on their experimental field at Rothamstead, in England, Sir John Lawes and Sir Henry Gilbert, with the aid of nitrate of soda, raised the yield of wheat from less than 12 bushels per acre to over 36. On the experimental Briarcliff Farm in New York State, last year, similar experiments, conducted under Prof. George T. Powell, showed that with an investment of \$2.62 in nitrate of soda the hay crop per acre, worth \$15.30, was raised to \$28.80. As an offset to lean pasturage and slovenly tillage, nitrate of soda has obvious merits.

Nor is this all. While in agriculture saltpeter deserves all hail as blessed, in warfare it is known as "villainous;" and without a plentiful supply of it modern warfare would certainly soon come to an end. The bow and spear would again reign supreme, as in the ancient world. Your modern battleship and your siege artillery, wasting the fee simple of a fine farm at every murderous whiff, would lie inert, like obsolete mastodons, without the nitric food that electrochemical art must now furnish to them. Nitro glycerine, gun cotton, dynamite, a whole vocabulary of smokeless powders and direful explosives, depend on the same raw material for their ability to convert granite into a fourth dimension. But nitric acid is equally important to the celluloid industry, and photography owes much to nitrate of silver.

Here surely is a field in which the imagination of the artist or economist, not less than the skill of the inventor, can find free play. Indeed, a startling story has already been written exhibiting the universe in flames, as a result of such irreverent handling of the atmosphere, but as far back as 1892, Sir W. Crookes, before the Royal Society, showed that while nitrogen is a combustible gas, the reason why its flame does not spread through the atmosphere, and deluge us in a Noachic flood of nitric acid, is that its ignition point is higher than the temperature of its flame. It is not hot enough, therefore, to set fire to the adjacent mixture of gases around it that we call air. On the contrary, enough has been said above, it is believed, to demonstrate that rather than cosmic disasters from this profoundly interesting and highly original work, we may confidently expect newer benefactions yet unforeseen. Mr. Bradley was already known in the electrical domain as a tireless and creative engineer, but by his latest efforts, which only a bold, undaunted genius would put forth, he has placed himself in line with men whose actions affect the well-being of the human race.

THREE OF THE BRONZE STATUES DESTROYED BY THE FALL OF THE CAMPANILE IN VENICE.

## COLLAPSE OF A GREAT HISTORICAL MONUMENT.

**F**OR many centuries the great bell-tower of the Cathedral of St. Mark's, in Venice, has been one of the famous monuments of Europe. Begun in A.D. 902, it stood 323 feet in height, and weighed no less than 20,000 tons. From its lofty summit the bells of St. Mark's have scattered their melody for a thousand years over the beautiful city. The Campanile was as a guardian angel, singing an ever-renewed song of glory and of praise in the ears of the Bride of the Adriatic. But for ten years past the existence of the Campanile had been known to be in danger. A veteran architect had been dinning into the ears of the authorities Cassandra-like warnings as to the coming destruction of the tower. There are none so deaf as those who will not hear, and his warnings passed unheeded. He then redoubled his outcry, and was exiled for his pains. Returning from exile, he once more renewed his lamentation over the coming doom of one of the greatest of the architectural glories of Italy. A few workmen were employed repointing the walls here and there, but it was mere tinkering at the outside. Then the inevitable happened. On the morning of July 13 cracks began to appear in the Campanile, visible even from the Piazza. The architect redoubled his warnings, and claimed that the Campanile had not twenty-four hours to live.

It seemed almost incredible that, with such prophecies in their ears and such fissures before their eyes, the people of Venice should have contemplated with comparative equanimity the fate of their Campanile. Even if they had not cared for the tower, they might surely have dreaded the havoc that seemed inevitable if 20,000 tons of masonry suddenly collapsed and fell by the side of the crowded Piazza between the Cathedral and the Palace, which are the pride and glory of Venice. They seem, however, to have taken the matter very nonchalantly. On Monday morning, July 14, the sun rose for the last time upon the old Campanile, lighting up with its own glory the golden angel on the tower.

At 9 o'clock, according to the story of an American architect who witnessed the fall of the tower from the neighborhood of the Rialto, he saw the golden angel slowly sink directly downward behind a line of roofs, and a dense gray dust arose in clouds. Instantly, from all parts of the city, a crowd rushed toward the Piazza, to find on their arrival that nothing was left of all that splendid nave but a mound of white dust, 80 feet high, spreading to the walls of St. Mark's. His daughter, little Katharine, had gone off to the square, with her horns of corn, to feed the pigeons. The child said:

THE CAMPANILE AND THE PIAZZA.

Everything was quiet; two men were putting up ladders in the tower, when suddenly people began to cry out from under the arches (it was warm sun and the Piazza was empty), little puffs of white flew out at the height of the first windows, great cracks started at the base and opened "like the roots of a tree," a fountain of bricks began to fall all around the walls, and she says as she looked she saw the golden angel, upright and shining, slowly descending a full third of the height of the tower, when a great white cloud enveloped it.

The Campanile had suffered the natural dissolution of extreme old age. It died almost without a sound, and in its death, miraculous though it may seem, it did not kill or wound a single living thing. On the surrounding buildings hardly any damage was done. The great treasures of art which were stored in the immediate neighborhood escaped without injury, and the golden angel, instead of being dashed to pieces, was found almost intact directly within the semicircle of the central doorway of the Cathedral. The

angel, say the Venetians, has flown home. It is to be placed upon the high altar with great pomp and ceremony in token of the miracle. The accompanying photographs show the Campanile as it was and the Piazza as it appeared immediately after the fall of the tower. The Italians spend but little money over the preservation of their monuments; they have received them as an inheritance from their ancestors, and consider that they are an eternal possession. This sudden reminder that everything but a pyramid crumbles beneath the touch of time has spurred the Italian Government and people into spasmodic activity, which may have good results in the preservation of many monuments which are now crumbling into ruin. The

Campanile is to be rebuilt. The statement that an American-Italian had subscribed \$100,000 toward its restoration is unfortunately contradicted. That sum has been voted, however, by the municipality of Venice, and it is estimated that it will cost \$600,000 to restore the tower. The new Campanile will be, of course, as nearly as possible an exact replica of the old.

THE RUINED CAMPANILE, SHOWING ST. MARK'S CATHEDRAL.

## LEADING ARTICLES OF THE MONTH.

### ATTORNEY-GENERAL KNOX, LAWYER.

**P**RESIDENT ROOSEVELT is besieged by the anti-trust interests, that want the trusts wiped out, and the trust interests, that want things let alone. There are laws on the books dealing with the trust question, and so far as the administration is going to deal with the trust question next winter the man of the day is the Attorney-General of the United States.

Mr. L. A. Coolidge takes the ground in the September *McClure's* that the trust question, as it confronts us just now, is a question of law, and is in the hands of Attorney-General Knox. He proceeds to inquire into Mr. Knox's capabilities as a lawyer.

### THE ATTORNEY GENERAL'S CAREER AS CORPORATION LAWYER.

"He is a dapper bit of a man, a tiny figure charged with life, quick-stepping, alert and nervous, with a smooth-shaven, clean-cut face, boyish except for lines of strength and the denuded forehead soaring high above the eyes. Certain Wall Street magnates in their wrath have called him a country lawyer. The description hardly fits. He hails from Pittsburg, the very home of concentrated wealth, about the last place one would look for a countryman to attack capital in pure wantonness. But he isn't afraid of Wall Street.

"For twenty years he was one of the most successful corporation lawyers in the United States. His personal retainers amounted to \$90,000 a year. When President McKinley asked him to become Attorney-General in 1897, he declined because he couldn't afford to exchange a professional income of \$150,000 for a salary of \$8,000 and a carriage. When the offer was renewed four years later, he was better able to make the sacrifice, and he was financially free and independent. He accepted. Then the labor organizations opposed his confirmation, because they thought he was the tool of trusts. But he isn't afraid of labor unions.

### A SAMPLE OF HIS LEGAL WORK.

"It was his suggestion to President Roosevelt to bring suit against the Northern Securities Company and to institute proceedings against the beef packers. He believed that these corporations were violating the federal statutes, and he believed it to be his business, as attorney for the Government, to enforce its laws and test them.

With him it is a cold, clear, legal proposition. There is no politics in it.

"He is not likely to be mistaken. Eight or ten years ago some Pittsburg capitalists bought the street railways of Indianapolis. A rival company claimed that under the law the fran-

Copyright, 1902, by Prince.

HON. PHILANDER C. KNOX.

chise was about to expire; they had laid the wires to secure a renewal of the franchise for themselves. The Pittsburg men went to Benjamin Harrison, just then retired from the Presidency. He gave it as his opinion that the franchise was about to expire. They turned to Knox. He told them the franchise still had a long time to run. The question involved millions, and they submitted the case to Judge Dillon, of New York. Dillon's opinion concurred with Harrison's. Then they laid both Dillon's opinion and Knox's before Harrison, and Harrison, after studying them, came to the conclusion that he and Dillon were wrong and Knox was right. Suit was brought in a United States court. The Pittsburg men

had already retained Harrison. They asked Knox to join him. Knox refused. They insisted. He said, 'I will on two conditions: First, you must draw me a check now for \$10,000; second, you must draw me another check for \$100,000 if we win the case.' He supposed that would end it. But they complied with both demands. The trial came. Harrison addressed the court for four hours. The other side occupied eight hours. Knox spoke forty-five minutes. The court's decision followed point by point the line of Knox's argument."

#### AMERICA SUCCEEDS CARNEGIE AS HIS CLIENT.

"Knox was Carnegie's attorney during the Homestead riots in 1892. His ingenuity steered the ironmaster through the perilous legal complications of those days. Some of his suggestions were bold. It was he to whom it first occurred that the riotous strikers were open to the charge of treason for violent resistance to the laws of the State. He was acting then as a lawyer, faithful to the corporation which he served. In bringing suit against the trusts he believes he serves with equal faithfulness his only remaining client—the Government of the United States.

"For Knox is a lawyer all through. He has all a lawyer's intuitions and instincts. To-day he is the attorney for the Government, just as for years he was the attorney for wealthy private corporations,—with this difference, that when he served corporations he had many clients. After he entered the service of the United States he regarded his salary as an exclusive retainer."

#### WIRELESS TELEGRAPHY.

PERHAPS the first authority on telegraphy in Great Britain is Sir William H. Preece. This eminent engineer gives a full account of his relations with Mr. Marconi in the August number of *Page's Magazine*, the new British engineering journal. He describes the progress which has been made in wireless telegraphy, and gives his opinion as to the best use that can be made of the new system. In 1894, two years before Sir William Preece met Mr. Marconi, the former read a paper before the Society of Arts on electrical signalling without wires. In this paper he reported: "We have not acquired a practical system of signalling across space without the necessity of using wires." This phrase, he explains, is not quite correct. The word "wireless" is an absolute misnomer. Wires are essential and imperative in some part of the plan. Every telegraph of every kind requires a transmitter to generate electric disturbances, a medium for the transmission, and a receiver to translate

them into comprehensible language. The medium may be either metal, as in the ordinary telegraph wire, pneumatic, aquatic, or etheric. Through metals in water the disturbances are transmitted as electric currents; through the air and the ether as waves. The inventor of the Morse alphabet telegraphed across the Susquehanna River without submerging any wire. Lindsay did the same thing across the Tay in 1854, and Sir William Preece assisted him in testing his plan in London in the summer. In 1882, Sir William Preece succeeded in bridging the Solent on Lindsay's plan. He says: "It is to this day a common practice in India to maintain permanent telegraphic communication across rivers by similar means. Water is thus the medium completing the circuit. The wireless portion is a very small fraction of the whole conducting path of circuit." The circuit conveys currents of electricity, and the underlying principle is that of conduction, by which a telegraph wire containing a current of electric disturbance will have telegraph wires in its neighborhood.

#### THE PRACTICAL STAGE NOT YET REACHED.

In 1884, an old telegraphist in the Telephone Company's Exchange was able to read telegrams that were being sent on the post-office system. This led Sir William Preece to the conception of etheric telegraphy by induction. Effects were detected between wires separated by a distance of forty miles, and distinct conversation was held by telephone through a distance of one-quarter of a mile. The subject was brought before the British Association in 1886. In 1892, messages were transmitted three miles across the British Channel. In 1894, speech was transmitted across Loch Ness, one mile and a quarter, by telephone. In 1895, communication was maintained in the Island of Mull during the breakdown of the cable. In 1896, Mr. Marconi was introduced to him, "and showed me another and better mode of doing the same thing by the aid of the Hertzian electric waves." The resources of the post office were placed at his disposal for experiment and trial. The Hertzian wave method was so successful that Sir William Preece was able to create a sensation by announcing the results attained on Salisbury Plain at the British Association meeting in September, 1896. "Unfortunately," says Sir William, "Mr. Marconi was captured by a financial syndicate, and his relations with the post office were severed. Nearly six years have elapsed, and the system has not yet reached the practical stage. At the present moment there is not a single practical commercial circuit established on this system in the world." Mr. Marconi is ambitious of conquering great distances, but what

is wanted is not communication across great oceans, but across narrow rocky channels and between tide-swept island homes. The system does not work well on land; it was a failure in South Africa; the sea is its home.

The Germans seem nearer practical success than

series of etheric waves, and blind to all others. We can even tune the eye to receive only one color. The ear hears all air vibrations between thirty-two and five thousand per second, and is deaf to all others, and it can also be tuned to hear one note."

#### VALUE OF ETHERIC TELEGRAPHY.

As to the commercial value of wireless telegraphy Sir William Preece is very emphatic. He says:

"The value of the submarine cable system has not been shaken one iota. The Atlantic is bridged by fourteen cables, always available and rarely disturbed. Each works at a speed far exceeding anything obtainable on an etheric circuit."

In practice he does not anticipate that etheric telegraphy will ever be able to transmit more than ten words a minute, as the speed of working is limited by the number of sparks, which are very capricious, and require much humoring. Nevertheless, it is invaluable for nautical purposes. It tends to render the navigation of the great deep safer; it places ships in communication with each other when in danger or distress; it prevents collision in fog or at night; it allays the anxiety of the passenger, and it gives confidence to the sailor.

#### THOMAS A. EDISON AT HOME.

"THE Unknown Edison" is the title of some pleasant stories of the great inventor, contributed by Mr. W. B. Northrop to the September *Success*. As late as ten years ago Mr. Edison was still an undomesticated man, who seemed to find his only happiness in assiduous work. Of late years, however, he has indulged in more and more relaxation from his toil.

The present Mrs. Edison, a second wife, is the daughter of John Miller, who invented the famous Miller mowing machine, and she herself has decided mechanical ability of the creative sort. She and her husband are about to patent a new device together. She takes a great interest in all of his work, and has acquired through her association with him a great amount of electrical and mechanical knowledge.

#### THE INVENTOR'S ABSORPTION IN WORK.

"An amusing story is told of the great inventor's first marriage. Shortly after the ceremony, he was called away to his laboratory on an important experiment. He plunged into the work. At midnight, one of his friends called to see him. He had just accomplished the object of his labors, and was preparing to quit work.

" 'I guess I'd better go home,' he said, as he

SIR WILLIAM H. PREECE.

the Marconi Company is in England; they use the Slaby-Arco system.

The principal source of foreign disturbances is atmospherical electricity and lightning. When a thunderstorm bursts it telegraphs letters of the alphabet, especially "e," "i," and "s." At the same time it breaks up the conventional signals of the Morse alphabet into an undecipherable language. There are terrestrial effects also, which produce disturbing elements in the ether. On a telephone, in the stillness of the night, sounds are often heard like loud whistles, sharp pistol shots, the screeches of sea-fowl, and the cries of babies. These are due to stray waves which are at present fatal to reliable etheric telegraphy. A foreign ship communicating with a consort so affected the electric-light circuit of a British ship eight hundred yards away that every signal could be read by the blinking of the light of one particular electric lamp. It is possible, however, he thinks, to tune ships to one series or note of electric waves, so that they may be quite oblivious to all others. He says:

"The eye is an electric organ, tuned to one

Copyright, 1902, by W. B. Northrop.

MR. AND MRS. THOMAS A. EDISON.

hurried into his coat, and jammed his hat down on his head: 'you know, I was married to-day.'

'The days of complete absorption in work have passed for him. His home-life has become necessary to him. Though he has had one or two relapses of 'working fever,'—when he steadfastly refused to be moved from the laboratory by Mrs. Edison's persuasions,—he has reached the period where he is glad to go to his home. Much honor is due to the woman who has wrought so marvelous a change in her husband. Those who knew Mr. Edison best predicted that his present wife would soon become a secondary consideration in his life. They are, from all accounts, mistaken.'

#### THE CHILDREN HAVE TALENT, TOO.

Even little Theodore Edison, three years old, is said to have a strong propensity to experiment with the wonders of his father's laboratory. Charlie, eleven years old, is Thomas Edison's idol.

'One day he said to his father: 'May I have that old car that stands in the yard?'

'Yes; if you will take it away and get it up to the house,' said the father, with a smile. He

evidently thought that such a proposition would daunt the youthful experimenter. The Edison home is about seven hundred feet from the laboratory, and stands upon a hillside, the grades of which are very steep.

'The next day he appeared at the laboratory with an old white horse, a lot of rollers, and another boy to act as his assistant. He borrowed from the laboratory some jack screws, and began to raise the car from its short strip of track. His father saw the initial stages of the performance, and wondered. He thought that Charlie might move the car across the level road in front of the laboratory, but expected him to give up when he should reach the steep hill. The lad went to work in a masterly fashion, got his car on its rollers, and moved it across the road. By work-carefully for several days, moving the car a little at a time, and keeping it blocked so that it could not roll back down the hill, the boy gradually got the cumbersome vehicle, with its trucks and everything else intact, and without even a broken window, to the lawn in front of the Edison house.

But this did not satisfy him. He built a

for the car, and, before many weeks, had a useful single-car railroad in operation. He and his boy companions experimented to their content, and the railroad was kept in working order until every experiment made by Charlie Edison had been tried. This invention pleased the senior Edison greatly.

#### THE EDISON HOME AT LLEWELYN PARK.

The Edison home is one of the finest residences in New Jersey, and is furnished with all conveniences and luxuries of a modern palace. It bears evidence of Mrs. Edison's true and skillful management. The lower floor of the house is laid out in parlors, conservatories, a magnificent dining room. Ponderous pillars, bristling with electric-light bulbs, from ceilings finished in open-work beams, exhibiting the best art of the builder. Mr. Edison has a fine library in his residence, though it does not contain so many scientific works as they have at his laboratory.

The upper floors are given up to sleeping quarters, and a special 'den' for Mr. Edison.

There he works out his plans, and has at hand reference books he desires in chemistry, physics, heat, light, and electricity.

He is an early riser, and is ready for work at past six o'clock. His first daily occupation is to read the newspapers. He is anxious to know how the reporters who interviewed him have just what he said, for he dislikes, above all, newspaper interviews that are not correct.

He does not like to be misquoted, and is going to go to any amount of trouble in order that his statements shall be reported without error. No matter how busily he may be engaged at the laboratory, he will stop to look over an interview, and no one is more willing than he that a reporter right."

#### A WORD TO INVENTORS.

The rôle of the inventor has always been a somewhat pitiable one, and it must be admitted that for one inventor who succeeds there are at least a thousand who fail utterly to realize dreams of fame and fortune.

In the *Nouvelle Revue*, M. Desmarest traces the rise and fall of the inventor, and the ill fortune which has attended some of those whom the world has reason to regard as its greatest benefactors. He points out the considerable shrewdness that the invention must have, and which brings its inventor a fortune, is generally some apparently insignificant little object, which has been elaborated without very much thought or time. The inventor who invented or rediscovered the safety-pin

made millions of dollars, as did the inventor of the steel pen.

#### TOYS THAT MAKE FORTUNES.

The inventor of a really good new toy is always sure to make a considerable sum of money, and a large fortune falls to the lot of him who can think of some really practical and sensible addition to an article already much in use. Fortune and fame attended the efforts of the man who first imagined the placing of a small piece of india rubber on a pencil shield. As was meet and right, a woman invented the baby carriage, and she is said to have made about \$50,000.

The French writer gives innumerable examples of those inventors who have benefited humanity, but who have not been very fortunate themselves. The question of patents is in every country a difficult one, and as most inventors are unbusinesslike, a good idea is often exploited by a man, or group of men, who would be quite incapable of making the actual invention. Large fortunes have been made by those who have simply adapted an already existing invention to the practical needs of humanity. There are still many things for which the world anxiously waits. One is a noiseless typewriter; such an invention would make its patentee rich beyond the dreams of avarice. Another is the dream, or rather nightmare, of every bottle-maker, wine and spirit merchant, and brewer in the world,—a cork which, by some ingenious and yet cheap arrangement, would automatically lock the moment the bottle was emptied of its contents.

#### THE ART OF BENJAMIN-CONSTANT.

THE late M. Benjamin-Constant, the French painter, is the subject of an appreciation by Mr. M. H. Spielmann in the *Magazine of Art* for August. In reference to the artist's work in portrait painting, Mr. Spielmann writes:

"It was in 1893 that his loving and exquisite portrait of 'My Son André,' now in the Luxembourg Museum, gained him the honor which is coveted by every artist of France for whom medals have any attraction at all. This picture he repeated for his wife, and it was this success probably that gave him a vogue as a portrait painter, and assured him a *clientèle* not in France only, but in America and England. In most of his women's portraits there is an opulence, an *ensemble* of presentation, which is not always in accordance with the best English taste for simplicity and modest grace; but when he did not aim at 'the grand style' he did extremely well. In his men's portraits he was much the more successful; not so much in respect of the merely

THE LATE M. BENJAMIN-CONSTANT.

fine, good-looking man as of those whose faces betrayed real character and subtlety of expression—which were not always flattering to the sitter. There is a world of love and tenderness in his son's portrait, and a world of cunning, of vulgarity, of—wickedness, shall I say?—in others which shall be nameless. At such times Benjamin-Constant was the fine portraitist, worthy, perhaps, of the eminence it was his ambition to reach, as successful a master of his brush as he was brilliant in the rendering of oriental light and color."

#### THE NEW CATHEDRAL AT WESTMINSTER.

SINCE the time of Sir Christopher Wren, no building has been erected in Great Britain equal in size to the Roman Catholic cathedral now in course of construction at Westminster. Nor is this the only interesting fact in connection with this remarkable structure. Mr. F. Herbert Mansford, writing in the *Architectural Record* for August, is responsible for the statement that none of the existing English cathedrals has so lofty a vault, so wide a nave, or so high a tower as the new erection at Westminster. While Westminster stands tenth in superficial area among the cathedrals of England, Mr. Mansford thinks that in cubical content it may exceed all but St. Paul's.

The erection of the cathedral was not finally

decided on till 1894, the design being intrusted to John Francis Bentley. The style of architecture chosen was the Byzantine, and the site, "hemmed in by lofty flats," forced the adoption of a tower as a conspicuous feature. When this tower is completed it will be nine times its breadth in height,—30 feet square and 280 feet high.

#### ARCHITECTURAL FEATURES.

The west front of the cathedral at Westminster is exceeded in breadth by only two of the English cathedrals—Lincoln and St. Paul's. Mr. Mansford's description follows:

"The front is in three planes, the higher one receding in a manner which suggests that the design had been partly governed by consideration of ancient lights. If this be so, we may congratulate the architect for turning necessity to good account. The lower plane of the work which rises from a granite plinth, comprises triple doorway and tympanum within an enclosing arch of receding orders. These spring from columns fluted only as to their upper thirds in height, and connected by a series of festooned and sculptured medallions. On either side are decagonal towers surmounted by copper domes, and beyond these again are the baptistery to the south and a subsidiary porch to the north.

"In the second plane we recognize the carrying up of the outer wall of the narthex. This contains three windows surmounted by a row of shell-topped niches. Here, as in the medallions, we recognize that blending of Renaissance motif with Byzantine detail which is characteristic of the whole structure, and gives it a certain piquancy.

"The third plane discloses the west wall of the nave itself, and is occupied mainly by a segmental-headed window following closely the line of the semicircular transverse arches within, but lessened in span by the flanking turrets leading to the roof. The walls beyond these turrets are really piers bearing the short barrel vaults which are at right angles to the length of the nave, and form a series of lateral abutments to the thrust of the concrete domes with which it is vaulted. Passing to the left into Ambrosden Gardens, one notices above the angle porch previously alluded to a charmingly detailed balcony approached from doors recessed behind an arcade, the whole showing in conjunction with features elsewhere the deliberate intention to obtain pleasing effect of shadow. The columns to the doorway beneath are channeled with flutes alternately wide and very narrow; the capitals, too, are of an unusual type. Beyond the tower are the first and second chapels of the nave, which are treated alike with

untraceried windows coupled under an enclosing arch, surmounted by a deep parapet wall of brick with frequent stone-lacing courses, and interrupted by occasional niches. The third chapel is lit by a couple of three-light windows with traceries in the upper portions. Above these chapels rises the lofty wall of the aisle, or more accurately, the curtain wall connecting the buttress piers previously mentioned; and yet higher is visible the wall of the nave proper.

"The transept is roofed at a lower level than the nave, and terminated with twin gables, being internally ceiled with parallel barrel vaults. These transept ends are almost the only gables on the church, and, taken in conjunction with the square turret at the eastern angle of the transept, form a composition less alien in outline than other portions of the structure. The turret is finished with a stone pyramidal roof and connected with the body of the edifice by a short open arcaded gallery, the whole being simply and vigorously treated and somewhat Romanesque in character. The bay of the church beyond the transept comprises the sanctuary, for the raised choir is beyond in the apse. The dome of this bay differs from those of the nave, being rather lower and pierced with circular-headed windows in its lower portions. Beneath on either side is a large lunette divided into three parts by V-shaped piers, the intervening windows being filled, like several others, with terra-cotta tracery. These traceries are varied in character, sometimes leaning to a reticulated type, and at others to more geometrical design, based on the Italian method of pierced slabs, but are built up of separate blocks, and carried over the whole surface of the windows.

"We have now reached the apse, which, with its open gallery, steep green roof and foliated iron apex cross, backed by the loftier wall forming the square end of the sanctuary, the flanking towers and white concrete dome between, forms a remarkable and beautiful composition. Viewed from the corner of Ambrosden Avenue, where the archbishop's new house forms the foreground, or from the end of Morpeth Terrace, where the steep roof of the sacristy occupies a similar position, the picture includes also a transept and the campanile."

WESTMINSTER CATHEDRAL.

It may surprise some American architects to learn that the materials chiefly used in this great structure are red brick and Portland cement. The dressings, bands, and copings are of Portland stone. "Green slates are used for timber roofs, but asphalted concrete holds undisputed sway over the greater part of the edifice."

Mr. Mansford's conclusion is that the building is likely to exert a far greater influence on church design than any purely classic or Gothic structure could have done at this stage of architectural evolution, and that it will occupy a more important place in the history of the styles than most of the

buildings of the Gothic revival. Of the architect he says:

"Mr. Bentley has come as near the development of a new style as it is probable one man ever can, without the invention of some new method of construction. His Neo-Byzantine is as distinctive as the Neo-Romanesque of H. H. Richardson. The curious thing is, however, that whereas the latter consistently developed his favorite style through a long series of works, Mr. Bentley has hitherto given us examples of English Gothic, or English Renaissance, sometimes with

suggestions of Flanders, or the chateaux of the Loire; but not, so far as the writer is aware, anything approaching in construction or detail the character of the work under consideration. It is the artistic and inventive intellect of the man, visible throughout the whole structure, which gives Westminster Cathedral its chief interest in the eyes of architects. The lay mind can scarcely be expected to detect this fully at first, but recognition of it must ultimately come to all who study the building with sympathy."

#### QUEEN ALEXANDRA.

IN the ceremonies of August 9, the part borne by Queen Alexandra interested the great public hardly less than the crowning of King Edward himself. Since the death of Queen Victoria many English writers have endeavored to interpret the new Queen to her subjects; but it is doubtful whether any of them has succeeded so well as Mlle. Vacaresco, who presents in the *Contemporary Review* for August a vivid, picturesque, and fairy-like portrait of the woman whom all Britain now delights to honor. Mlle. Vacaresco is a child of southern Europe; she is a woman who is writing of one whom she knows and loves; and the reader would willingly sacrifice a thousand dull studies in black and white for this delightful presentation of Queen Alexandra, as radiant and glorious as the figure of a saint in a cathedral window. There is imagination here, and poetry, and a capacity to present one woman's enthusiasm for another in language that is worthy of the theme.

#### WITH CARMEN SYLVA AT BALMORAL.

Mlle. Vacaresco was attached to the court of Carmen Sylva when she first visited Balmoral, and the influence of the royal poetess of Roumania is perceptible in the story which she gives us of her impression of the Queen. She had been presented to Queen Victoria, and had felt what Bouget calls *le frisson de l'histoire*—the great shiver of history—"in seeing before me so many years of glory represented by a kind old lady, whose clear blue eyes looked straight into my heart; whose voice, distinct yet gentle, questioned me pleasantly on our journey and our first impressions in Scotland." She could not have answered had she not perceived by the side of the Queen "a face so soft, beautiful, and reassuring that I kept wondering who the dazzling unknown might be. Her eyes had the azure, intense and bright, of the water where sirens meet." She thought that she was one of the youthful daughters of the Prince of Wales, and "my admiration and worship went toward her

only because of her smile and the intense azure of her eyes."

#### HER MEETING WITH QUEEN ALEXANDRA.

They talked a little, and Mlle. Vacaresco expressed a wish to be introduced to the Princess of Wales. "You have just been speaking to the Princess," said Carmen Sylva, and so their acquaintance began. Carmen Sylva described the glories of the Roumanian landscape. Then Princess Alexandra spoke in her turn, describing the charm of the northern landscape, reminding the listener of Victor Hugo's dialogue between the Peri and the fairy, and the oriental queen and the star of occidental skies.

Next day, in the forest, she again met Princess Alexandra, who seemed to her to represent springtime and hope. "I had seen a fairy among the purple hills of Scotland in the dark December day."

A few years later she met her again in Rome, and in the pagan splendor of Roman noon, three months after the death of the Duke of Clarence. She was awed by the rigid white face, and the smile that had been broken like a flower from its stem.

The third time she met her at Marlborough House, after the death of Queen Victoria. The Queen said: "A great duty has now fallen upon me, a great task is set before my soul." In reply to a remark of her visitor, the Queen said:

"Yes, the King knows how to make himself beloved. He understands and cherishes the nation. But if they love me, it is only because they are so good and true. You cannot imagine how good, how true, the people are in England, in all classes everywhere. There are some princesses and reigning queens, are there not, who ever feel themselves strangers in the lands that become theirs by marriage? I have never known this feeling, not one single moment, and now I never succeed in discerning that I am not born here; it seems to me as if even my childhood had been spent here, and even when I am away from this land I am not absent. I am here, and I am in every corner of England, as if I belonged to this earth entirely. The people are so good. They partake of all our joys and sorrows, and their joys and sorrows are ours."

When the Queen dismissed Mlle. Vacaresco, she stood in the green light of the neighboring trees exactly as she had stood in the autumn forest, and again she represented springtime and hope, serenity and strength.

#### QUEEN ALEXANDRA'S LIKES AND DISLIKES

In addition to her account of her three meetings with the Queen, Mlle. Vacaresco tells us

something concerning the Queen's tastes. Music, she says, is one of her great delights. She has a deep-rooted taste for art, and discerns the great part art is called upon to play in modern society. She not only encourages artists, but also explains to them how much she relies on their talent and their help in hours of depression. Poetry, however, the Queen prefers to everything else. She is accustomed to recite aloud the poems that please her, provided she be quite by herself. She detests exaggerations of feminism, and lays particular stress on her disapproval of those doctrines; but she esteems the labor of womanhood in the lower classes, and admires women poets, singers, and painters. Dogs she prefers even to horses, and hearing once a remark that Michelet called dogs candidates for humanity, the Queen remarked that Michelet was wrong if he thought a dog would not be content to remain one, even though he had the choice; though, she added, what would tempt a dog or any other animal to enter the ranks of mankind would be the prospect of possessing an immortal soul.

It is impossible to carry on a long conversation with the Queen without being struck with the evidence of her piety. "Goodness in women is the chief virtue, and outshines all other qualities," said the Queen. "When a woman is good, she can do without beauty and talent. Goodness is the eldest sister of intelligence."

#### THE COLONIAL CONFERENCE.

**I**N connection with the meeting of the colonial conference in London this summer, it is interesting to recall the fact that the first conference of this kind sat in April-May, 1887, Lord Knutsford being Colonial Secretary; the second was held in 1894, Lord Jersey attending on behalf of the British Government, and Lord Ripon being colonial minister. The colonial premiers at this conference first adopted a resolution in favor of preferential trade within the empire, and recommended the repeal of the treaties with Germany and Belgium, which rendered it impossible for the colonies to give preference to British trade. The third colonial conference was held in the jubilee of 1897 in London, Mr. Chamberlain being Colonial Secretary. It was at this conference that Mr. Chamberlain proposed the formation of a federal council, which was rejected, the conference resolving that the present political relations between the United Kingdom and the self-governing colonies are generally satisfactory under the existing condition of things. Mr. Seddon and Sir Edward Braddon were the only dissentients.

At the conference this year Mr. Chamberlain summoned the colonial premiers to discuss with them questions of the political relations between the mother country and the colonies, imperial defense, and the commercial relations of the empire.

#### THE QUESTION OF A ZOLLVEREIN.

The current number of the *Quarterly Review*, after setting forth the various stages through which these conferences have passed from the beginning, passes in review the history of the efforts which have been made to establish a zollverein. A British zollverein, it declares, need not be discussed. It may be desirable, but it is not desired. The colonies have no wish to revolutionize their own fiscal systems. All that they are willing to do is to give a certain preference to British goods. Mr. Hofmeyr, in 1887, made the first proposal in this direction. He suggested that an imperial navy tariff of 2 per cent. should be levied at all ports of the empire on all goods entering the empire from abroad, irrespective of existing tariffs. This, he calculated, would yield seven millions sterling, of which the people of the United Kingdom would pay by far the largest part. Colonel Denison proposes to raise the tariff to 10 per cent., which would yield forty-four millions, the United Kingdom paying forty-one millions, and Canada and Australia three and a half millions. The *Quarterly Review*, therefore, dismisses the Hofmeyr-Denison scheme as a revolutionary and perilous enterprise outside the scope of practical politics. The only thing possible to be done is to accept with thanks any offer which the colonies may make of refusing duties on English goods. The reviewer prefers much the schemes for developing steamship services rather than propositions to restrict trade by imposing fresh taxes. For a forward policy in this direction time is fully ripe.

#### • IS A KRIEGSVEREIN POSSIBLE?

A zollverein is impossible, but a kriegsverein ought, in the opinion of the reviewer, to be regarded with more favor. But he regretfully admits that in military matters the volunteer principle is likely to continue as in political and voluntary. All that can be done in that direction is to establish a common understanding with regard to armament schemes of mobilization, the formation of reserves, and other kindred matters. In the field of law something might be done to create an imperial court of appeal, composed of a combination between the House of Lords and the Judicial Committee of the Privy Council, which would be a better symbol of the empire than

even the Parliament at Westminster. Besides the constitution of a court of appeal something might be done to give a uniform imperial law in the matter of trade-marks, copyright, patents, naturalization, and emigration.

#### SHALL THESE CONFERENCES BE PERIODICAL?

The reviewer concludes with a suggestion that steps should be taken to give some periodicity to the meeting of colonial conferences. Some day there may be evolved an imperial council advising the crown, and acting as a medium between the groups of federated states and the great executive officers in charge of imperial interests.

#### OUR NAVY AND ITS COST.

AT present there are ten first-class battleships building in the United States,—a larger amount of new construction work than any other nation has in hand except the English navy, and that has only three more. When our new navy was begun we were twelfth or fourteenth among the world's sea powers, and now we are, say, fourth, and probably on the way to being third, in efficiency. Great Britain and France are the only powers which could confront the United States with such an overwhelming force as to put the general naval board at Washington to studying the defensive problem. Although Japan's navy is stronger in its own waters than that of any other one navy permanently maintained on the same coast, it has no place in the world-reckoning of navies. Dr. Talcott Williams discusses the United States' new navy and the cost of supporting such a luxury as a first-class modern fighting fleet in the *Atlantic Monthly* for September.

#### TWENTY-FIVE MILLION DOLLARS A YEAR ON NEW CONSTRUCTION.

This is the price, Dr. Williams tells us, of the maintenance of a first-class sea power, and only five national budgets can afford it: England, the United States, Germany, France, and Russia. Of these, England and France are in advance of the rest. If the world's battleships are reduced to terms of the *Indiana* or *Massachusetts*,—10,000 tons, 15-knot speed, four 13-inch guns,—launched within fifteen years, the United States, in 1890, was sixth, being led by Great Britain, France, Italy, Russia, and Germany. By 1896, the United States had passed Germany on that basis, but was still led by the rest, and by 1902 the United States has passed Italy, and is led by Russia, if existing, or by Germany, if approaching, naval strength be considered. There will be a period, just as the twelve battleships and

two armored cruisers, building or authorized, are completed, when in the fighting line, measured by efficiency, the United States will be third. But the period will be brief, unless our naval expenditure for new construction is kept up to an inexorable annual average of from \$25,000,000 to \$30,000,000. "This is to-day the minimum price for the naval security of a first-class power, one of the Big Five, whose common action and consent rule the world, and make up a world concert steadily gravitating into three divisions,—Russia and France, Germany and central Europe, England, and the United States,—in which last recent events in China and South Africa have suddenly burdened the United States with many of the responsibilities and some of the initiative of a senior partner."

#### THERE ARE NO SMALL FLEETS TO-DAY.

Dr. Williams points to the fact that all the lesser fleets have disappeared. They existed even twenty years ago. Two centuries ago Holland was still equal to an even fight with England, and the battle of the Baltic had its centenary only last year; while it will be five years before the centenary of the Danish surrender to the British fleet, and until these twin events Denmark had still a fleet deemed worth destroying at the cost of an act of atrocious bad faith. Even the Barbary states had fleets up to a century ago equal to naval warfare. In 1881, Chile had a stronger fleet than the United States. There were then at least a dozen flags capable of giving a fair account of themselves. These have disappeared. The little folk among the nations have ceased to maintain navies. The fighting force of the five great nations has become so visible and so calculable that nothing else is considered. The lesser powers own vessels. They no longer possess a navy in any proper sense of the word.

#### THE AMERICAN END IN NAVY BUILDING IS MODERATION.

Dr. Williams traces the work of building a real American navy from the discussions of the first Naval Advisory Board twenty-one years ago, at a time when this country still thought it could safely place on the sea a small and efficient navy, easily to be made the nucleus of a larger one,—our naval policy since John Paul Jones. The striking characteristic of our new navy, Dr. Williams says, is moderation, a balance between extremes, ships of moderate size, eschewing extreme speed, of great power and unusual stability, and of low, but safe metacentric height. Our guns are not of the abnormal caliber some European governments have used. The armor

is not of inordinate thickness, because our harbors have shallow entrances, fixing the best draught at under twenty-five feet, though later vessels reach the English limit of twenty-seven feet and an inch or two. Dr. Williams ascribes no small share of this even balance of ship and armament to the wisdom of Mr. Charles H. Cramp.

But although the battleships built by the European governments have a higher speed requirement than the American ships, Dr. Williams points out that the tests are very different in America and Europe. Our speed trials are much more severe. The English and Continental speed test is a mile in smooth water, over whose familiar stretch a vessel speeds with forced draught, picked coal, trying it again and again, often with several breakdowns, until a fancy record is won. The American speed test is for forty miles in blue water, unsheltered, with service coal and service conditions. The allowance this calls for no one can give. But it exists, and is important. "The *Oregon* in her matchless voyage around South America under Admiral Clark, the one supreme feat of the war, averaged 11 knots, attaining 14.55 on one run of nine hours, far nearer its trial trip of 16.7 knots than is likely with the *Centurion*, begun in the same year, of the same tonnage, and 18.25 knots."

#### A WEAK POINT IN OUR NAVAL MANAGEMENT.

We are building battleships rapidly, and probably as fast as necessary, but there are three factors in a modern navy needed for its success,—ships, officers with men, and equipment. Officers are still inadequate in number for American ships. "There remains the swarm of subsidiary naval aids, coaling stations, dockyards, material, and a distributed store of ammunition. How scant this last was in the spring of 1898 will not be known for a generation. Two ships went into one of the two actions of the war with eighty-five rounds or so per five-inch gun, when they should have had one hundred and twenty-five. Some thirty-five rounds won the fight. Suppose it had not? Without fortified bases in the West Indies, in the Hawaiian Islands, and in the Philippines, and all needs of war at hand at home, our fleet at the critical moment may be like a boiler without steam. This third need Congress and Parliament both fail to meet."

Dr. Williams says that as we are pledged to protect the Western World from aggression, we must keep our present station of fourth among the naval powers at all costs. To do this the United States must add to its nineteen first-class battleships as many more in the next sixteen years, or two to each Congress. We will then never have to resort to force to support the Monroe Doctrine.

#### THE CAPE TO CAIRO TELEGRAPH.

ONE of the famous projects of the late Cecil Rhodes was the Cape to Cairo telegraph, 5,600 miles long when finished, which Mr. Rhodes hoped would reduce the cost of cabling from Cape Town to London from about \$1.10 to 25 cents a word. Part of the line has been in use some time. Its entire length is marked at intervals with the graves of those who have died in constructing it. Far ahead,—sometimes 200 miles,—of the engineers are always Mr. Otto Beringer, the surveyor, and two assistants and native porters. In *Harmsworth's Magazine* for July Mr. F. A. Talbot describes some of the difficulties of carrying out the undertaking.

Steel posts must be used instead of wood, which is liable to be devoured by ants. The difficulties of transport have been enormous. Everything is transhipped at the coast on to shallow boats which go as far up the rivers as possible; then native porters are used. Over one hundred engineers and several thousand blacks are employed in building the telegraph.

When the wire passes through forests a wide clearing is made, and the posts (generally weighing 160 pounds) are planted in the middle of it, to avoid falling trees. Elephants, unfortunately, are particularly fond of rubbing against the posts, and rubbing them down altogether, but the line is now so well patrolled that any mishap can soon be put right. Electric shocks practically taught the natives to keep from meddling with the wires. Sometimes the line is overtopped by the luxuriance of the vegetation, which the natives refuse to cut down for fear of crocodiles. Sometimes a tree of 100 feet circumference has to be cut down. Rainy seasons interrupt work periodically, and fever marshes and wild animals are, of course, constant dangers.

All along the route are frequent depots of repairing materials. How costly these must be may be guessed when it is said that the tariff between Nyassa and Tanganyika is \$150 a ton.

The highest speed at which the construction has been carried out is twenty miles a week.

#### THE PACIFIC CABLE ROUTES.

PRESIDENT ROOSEVELT'S decision, on August 8, in the matter of concessions to the Pacific Commercial Cable Company, recalls public attention to the fact that the United States now controls the most important routes for Pacific submarine cables.

The enormous disadvantage under which we now labor in the transmission of messages from the United States to the far East is made clear in an article contributed by the Hon. O. P.

Austin to the *National Geographic Magazine* for August:

"Messages from the United States to the Orient at present go via Europe, through the Indian Ocean, skirting the eastern coast of the Asiatic continent, traveling enormous distances, and occupying considerable time in transmission, to say nothing of the high rates of toll which must be paid for this circuitous service.

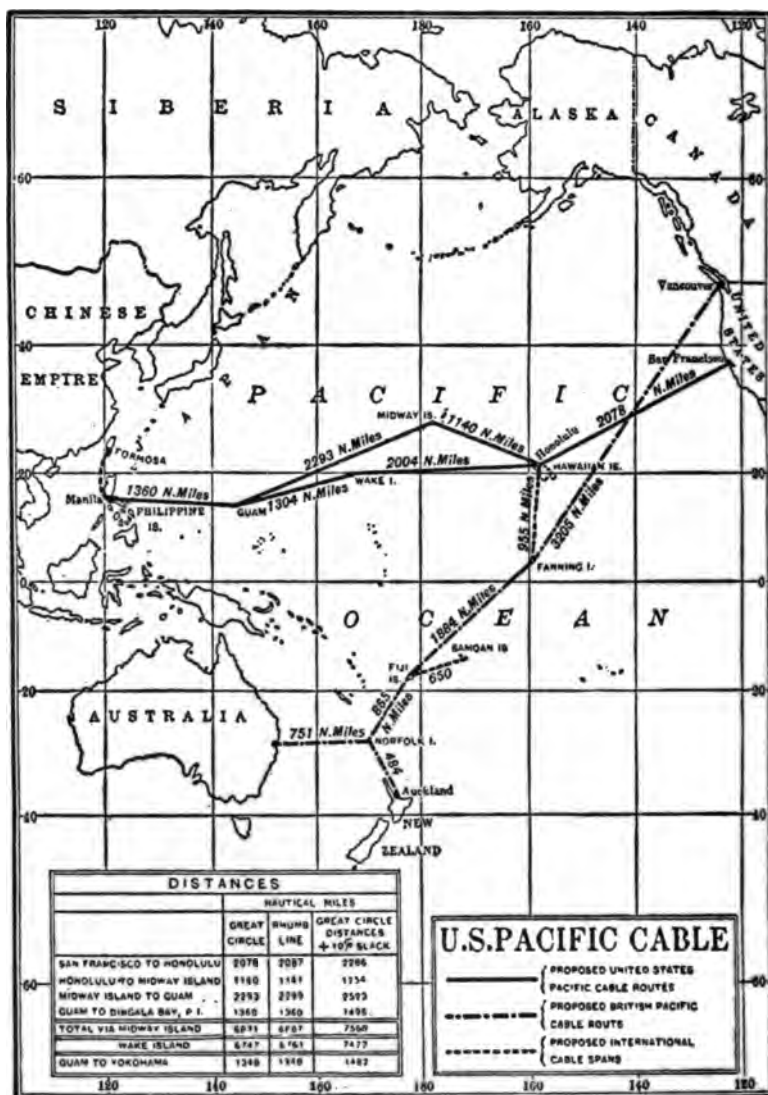

**THE UNITED STATES HOLDS THE KEY TO THE SITUATION.**

"The experience of cable builders and operators is that a distance of 3,500 miles is about the limit at which cables can be satisfactorily operated without way stations, at which the messages are transmitted from section to section of the line. It is because of this fact, and because there are few places in the Pacific in which islands are so located as to furnish the necessary way stations for relays, that the construction of submarine telegraphs across that ocean has not been undertaken. Even where islands exist at such intervals as to justify the attempt, they were so divided in national control that no country or group of capitalists cared to undertake this enormous task. But now all this is changed. The events of the past three years have brought under the control of the United States a line of islands stretching from convenient intervals from the western coast of America to the eastern coast of Asia. The Hawaiian Islands, Wake Island, Guam, and the Philippines form a continuous line of great natural telegraph poles upon which we may string a wire or series of wires, by which we may converse across this great body of water, stretching half-way round the globe, making every one of its intermediate landings and relay stations on our own territory, and protected by the American flag."

Thus, through the acquisition of new territories, we occupy an independent position in the Pacific.

**THE BRITISH PROJECT.**

"Meantime England has decided to attempt to connect the western coast of Canada, via Fanning Island, the Fiji group, and Norfolk Island, with her southern Pacific possessions of Aus-

tralia and New Zealand. The proposed routes of these two cable systems are shown on the map here presented.

"It is proposed also to construct connecting links between Fanning Island and the Hawaiian Islands, and by a short side line connect the Samoan group with the main line. This would give to the American and the British lines an opportunity for an interchange of business, and

put all the important groups of the Pacific,—the Hawaiian group, the Samoan Islands, the Fiji group, Guam, and the Philippines,—in direct cable communication with our western coast, and enable vessel owners and owners of their cargoes to communicate with them *en route* to and from this great market which we are seeking to invade."

#### PANAMA VERSUS NICARAGUA.

THE published extracts from the reports of the Isthmian Canal Commission have made the public fairly familiar with the reasons that determined the choice of the Panama route. Articles written by members of the commission have also supplied important data. Last month we quoted from Professor Burr's paper in the *Popular Science Monthly*. In the August number of that periodical the same authority sums up concisely the relative advantages of the two routes as follows:

"Both routes are entirely 'practicable and feasible.'

"Neither route has any material commercial advantage over the other as to time, although the distance between our Atlantic (including Gulf) and Pacific ports is less by the Nicaragua route.

"The Panama route is about one-fourth the length of that in Nicaragua; it has less locks, less elevation of summit-level, and far less curvature, all contributing to correspondingly decreased risks peculiar to the passage through a canal. The estimated annual cost of operation and maintenance of the Panama route is but six-tenths that for the Nicaragua route.

"The harbor features may be made adequate for all the needs of a canal by either route, with such little preponderance of advantage as may exist in favor of the Panama crossing.

"The commission estimated ten years for the completion of the Panama Canal and eight years for the Nicaragua water way, but the writer believes that these relations should be exchanged.

"The water-supply is practically unlimited on both routes, but the controlling or regulating works, being automatic, are much simpler and more easily operated and maintained on the Panama route.

"The Nicaragua route is practically uninhabited, and consequently practically no sickness exists there. On the Panama route, on the contrary, there is a considerable population extending along the entire line, among which yellow fever and other tropical diseases are probably always found. Initial sanitary works of much larger magnitude would be required on the Panama route than on the Nicaragua, although probably as rigorous sanitary measures would be re-

quired during the construction of the canal on one route as on the other.

"The railroad on the Panama route, and other facilities offered by a considerable existing population, render the beginning of work and the housing and organization of the requisite labor forces less difficult and more prompt than on the Nicaragua route.

"The greater amount of work on the Nicaragua route, and its distribution over a far greater length of line, involve the employment of a correspondingly greater force of laborers with attendant difficulties for an equally prompt completion of the work.

"The recent volcanic eruptions on the Island of Martinique indicate a possible danger to the Nicaragua canal, should it be built, from the living volcano of Ometepe, in Lake Nicaragua, about ten miles from the land line. That there is some danger is beyond question, but it is very remote. There is no evidence to show that a canal or canal structure ten miles distant from Mont Pelée would have been injured by its recent eruptions, although navigation might have been interrupted for a short time. It is an open question, therefore, whether Ometepe in most violent eruption, even, would injure the Nicaragua Canal, although danger would exist.

"On the other hand, as there is no volcano within about one hundred and seventy-five miles of the Panama route, that route would be free from all danger of volcanic eruption."

In regard to the negotiation of concessions and treaties, Professor Burr thinks that there is not much choice between the two routes, although he admits that the Nicaragua route may, perhaps, be "freer from the complicating shadows of prior rights and concessions."

#### THE REVOLUTION IN COLOMBIA.

IN view of the relations into which we are likely to be brought with Colombia through the construction of the Panama Canal, the political disturbances in that country already possess more than an academic interest for the people of the United States. This being the case, it seems strange that the accounts of the present revolution furnished to the American press should be so few and so meager. An attempt to present the main facts of the situation down to the month of February, 1902, is made in the August number of the *Missionary Review of the World*. The name of the writer of the article is not given, but he is said to be fully deserving of confidence.

The revolution was begun on October 17, 1899,—almost the precise date of the outbreak of the Boer war. The government is said to be

placed 75,000 men under arms, and the revolutionists are believed to have mustered 35,000. Some 400 combats of greater or less importance had been reported up to February last; the number of men killed on both sides, up to that time, was estimated at 50,000.

The Conservatives themselves deposed President San Clemente two years ago, and the Vice-President, Dr. José M. Morroquin, was placed at the head of the government. His administration has been seriously handicapped by the lack of concord among the Conservative leaders.

#### FINANCIAL CHAOS.

The desperate plight of the Colombian finances was described by Mr. Edwin Emerson, Jr., in an article on "South American War Issues" contributed to the *REVIEW OF REVIEWS* for March, 1902. The Colombian peso has declined in value, since the outbreak of the war, from 25 cents in gold to about two cents. There are now about 200,000,000 pesos of inconvertible paper currency in circulation, which is legal tender for all debts and obligations. The *Missionary Review* writer describes the resulting situation as follows:

"The poorest people, who earn their living by the sweat of their brows, are those who have suffered the most. The government has also found that the issue of paper money will not supply its necessities. Foreign exchange must be bought with which to get war materials, and as it requires some fifty pesos to buy each dollar, this falls with crippling force on the treasury. Although the government had yielded to the temptation to issue larger and larger sums of paper money, and had seen its pernicious effects on the morals of the people and on the integrity of the government itself, there was no remedy except to continue or to confiscate the property of the people for public uses. The result has been a compromise in which the evil effects of both measures are clearly felt. Confiscation of property, forced loans, and contributions of war have been required of the people, and especially from those who are known to sympathize with the revolutionary party.

"The effects of these measures are most deplorable. Industry of every kind has been almost completely paralyzed, agriculture destroyed, many of the farmhouses burned, and villages abandoned; and now, with the forced loans and contributions of war, the banks and commercial houses in all the business centers of the republic are on the verge of ruin."

#### REASONS FOR THE WAR.

Following is the indictment of the government as presented by the Liberal, or revolutionary, leaders:

"The Conservative party has suppressed 'parliamentary government,' and has established in its place a 'presidential government.' The real meaning of this expression is that the development of the Colombian Government is exactly the contrary of that of the English Government. In Colombia the real power is lodged in the president, while in England it is in reality in the House of Commons. The president cannot be called to account for his actions, and he possesses extraordinary power to issue legislative decrees and to execute the laws by what is known as 'the administrative process.' He appoints his cabinet, the governors of the states, and all executive officers, either directly or through those whom he has already appointed and can remove at will. These officers become his personal agents. The courts decided in the case of *El Heraldo*, a printing establishment; that the governor of the department could not be tried by the courts for closing the establishment without process of law and in time of peace, because in doing so he was acting under express instructions from the president, who is not responsible to the courts for such matters. To change this plan of government is one of the objects of the revolutionary leaders, and they believe that only an armed insurrection can change it.

"All members of the Liberal party have been excluded, not by law, but by the practice of the 'powers that be,' from all civil and military offices ever since the Conservatives came into power. This is in general true, and the excuse made by the government party is that the opposition has made known its intention to overthrow the government at the first opportunity. The Liberals say that no remedy can be found in the government itself, for the powers of Congress are exceedingly limited, and that no legislation could even be proposed without the consent of the 'Council of State' (composed of men entirely under the control of the presidential party). In addition, the election laws, and the practices under them, are such that the government party can prevent the return of any candidate that it may wish to exclude, as has constantly been done since 1886. This fact, admitted in its general terms by all parties in Colombia, is used to justify the plea that the institutions ought to be reformed, and cannot be reformed except at the point of the bayonet.

#### OPPOSITION TO THE CHURCH.

"Again, there is a Church question involved in the strife, so that the clerical party is entirely on the Conservative side. The Liberal party affirms that the favors shown to the Roman Catholic clergy, orders, etc., in exemptions of

trials before the common courts and from the payment of taxes, import duties, etc., are unjust to the rest of the population, and should be abolished. Strong objections are made to the laws that place the entire control of education at public expense in the hands of the clergy, and to those that place the administration of the public cemeteries in their hands, because they are abused for party and Church interests. Equally strong objections are made to the marriage laws, as these laws are administered and offenses against them are judged by the clergy. Violent objections are also made to the payment to the Church officers of an annual tax of considerable proportions, on account of some claims that the Church has made against the government of Colombia for property taken years ago."

The Conservatives, on the other hand, charge the Liberals with opposition to the Roman Catholic Church, not so much on account of disliking the exemptions granted and the privileges given, as on account of opposition to all religion, and because they desire to live irreligious and immoral lives.

#### WHAT WILL THE OUTCOME BE?

This writer indulges in no rose-colored prophecies regarding Colombia's future. As to the evil that has already been wrought, he is very positive. He says:

"A statement of the prospects before the country must necessarily be defective, because at present we cannot judge whether it is likely that the attempted revolution will triumph by force of arms or be suppressed. This much we do know, that the material civilization of the country is completely prostrated, and that it will be years before it can be reestablished even under the best form of government. The loss of so many of the young men of the country has taken away the working force, and so will retard its recovery. The great debt that rests on the country, not only to pay the claims of the foreigners and citizens who have suffered in their persons and property, and to meet the claims of Colombians who have given of their lives and substance in the strife, but also to meet the great issue of paper money that has been made, will stagger the treasury for years to come. The return to a sound currency will be more trying on the people than any financial question they have ever tried to solve in the past. But this is not the worst; passions have been inflamed that will not cool for years to come. Already these have destroyed thousands of lives and millions of property, and it looks now as if much more blood must yet be shed and more property destroyed before the end will be reached.

"Although it may seem as if the reactionaries are in the majority in only a few places, yet they are in power, and they will not give up without a more furious struggle, that will be fought from hilltop to hilltop all over the Colombian Andes. On the other hand, the revolutionary party seems to be determined to win or to perish in the attempt. They state that they intend to continue until they unseat the existing administration and reinstate the reform party. The form that the civilization of Colombia will take depends to some measure on the political organism that remains in power after this struggle is over, and this cannot be predicted at the present time."

#### KANSAS OF TO-DAY.

AN excellent article, describing the past ten years' vicissitudes of the great State of Kansas and her prosperity to-day, is contributed to the September *Atlantic Monthly* by Charles M. Harger. He says that it is not only the good crops of the past few years that should have credit for the present prosperous condition of the Kansas farmer; the habits of thrift acquired during the hard times after the bursting of the boom in 1887, and the sturdy character of the people of the Sunflower State, would by this time have brought the great grain-growing community into good times, even without "bumper" crops. This is, in brief, the Kansan's experience of the past generation.

#### THE SETTLEMENT, THE BOOM, AND ITS COLLAPSE.

"On an exaggerated parallelogram, tipped 3,000 feet higher at the west end than at the east, a million and a half people settled in two decades. Many of them did not comprehend that the farming which might succeed in the East, or even along the Missouri border, would be a failure on the high-tilted prairie, because of a lack of rainfall. Then there was the experience of the boom, that surging time when town lots spread out until they seemed likely to absorb the farms. The day of reckoning came next. Two hundred thousand people moved out of the State. Some went in Pullman cars, some in wagons, and some walked. Mortgaged claims were deserted, houses and stores were left empty, land in the 'additions' once more sold by the acre instead of by the lot."

#### THE TEACHINGS OF ADVERSITY.

Out of this came the political vagaries by which Kansas was so largely known to the world in the nineties. But in the meantime the people were profiting by the lessons of adversity. They had learned that kaffir corn and alfalfa would stand

the drought, that cattle and sheep would thrive in western Kansas, that diversity of crops would give regular returns, that creameries paid good dividends, that hogs were more profitable than parades,—in short, Kansas was a good place to farm in after all, if you did it in the right way.

#### THE REGENERATED KANSAS.

"In 1897, the Kansan stopped talking about wanting to sell out that he might go back East; in 1898, he was better contented; in 1899, he raised the price on his real estate and built a porch and bay window; in 1900, other improvements followed, and he congratulated himself on his foresight in having remained while so many left the State.

"In the five years ending with the crop of 1901, Kansas raised 323,176,464 bushels of wheat and 681,452,906 bushels of corn. These were indeed fat years. The corn crop of 1889, 273,888,321 bushels, and the wheat of 1901, 90,333,095 bushels, were the largest in the history of the State,—but the average annual yield of wheat for ten years has been 40,450,354 bushels, and of corn, 142,856,553 bushels, the average total value of both crops being over \$60,000,000. The records of the State agricultural board show that for thirty-four years the average yield of corn, whether in corn territory or where none at all grew, was twenty-seven bushels per acre, and for twenty-five years the average farm value of Kansas corn per acre has been \$7.31.

"While 16 counties raise more than half the wheat of the State, 55 counties out of the 105 produce good returns of that cereal. Now that there seems to be a fairly clear understanding of the agricultural limitations, a much better record should be possible. The fact that in two years past the increase in the value of agricultural productions and live stock has been \$51,278,936 over the preceding two years gives good reason for the encouraging outlook. Each year the live-stock interests assume larger proportions and greater value,—and the products of the range are affected little by dry weather. The average total product of farm and ranch for twenty years has been \$142,861,380 annually.

"The State banks had on deposit in December, 1896, \$34,553,000; in September, 1901, they had \$42,000,000, while the national banks had \$45,000,000 more. In the past five years, besides reducing mortgages and laying up \$50,000,000 in increased bank deposits, the State has made progress in its public finances. The counties, cities, and school districts refunded \$6,200,000 of bonds at a saving of one to two and a half per cent. in interest rate. The actual reduction in the principal of bonds for the year ending

July 1, 1900, was \$2,978,321. This was in spite of the fact that many counties issued new bonds for public buildings and other improvements."

#### A CITY REAL-ESTATE "TRUST."

THE United States Realty and Construction Company, the extraordinary combination recently effected in the city of New York, is the subject of an article in the September *World's Work*. The United States Company consists of five of the strongest real-estate corporations in the metropolis, and is capitalized at \$66,000,000; it has, too, the direct and indirect backing of the strongest financial institutions in America. The George A. Fuller Construction Company, the most important concern of the five which have been merged, has enjoyed great success in the business of erecting large office buildings in Chicago, Baltimore, and Washington, as well as in New York and other large cities.

The idea of dealing in real estate as so many shares of stock is comparatively new. Up to the present time the business has been in the partnership stage, and this ownership of real estate by private individuals or estates has led to much vexatious litigation over the division or partition of properties.

#### THE ADVANTAGE OF THE NEW PLAN.

"In commercializing real estate this new combination will view each large property which is purchased as a great industry, to which must be applied the same rules of economy and careful management as is the case with large manufacturing plants. When the property is first purchased, the question of title will be forever settled. An investor buying a share of stock in that land will no more think of inquiring into the title than he will concerning the title of a railroad to its plant. Deaths will not destroy the integrity of the property. The shares will pass to the proper heirs just as any other personal property."

The promoters of this enterprise believe that it will give an advantage to the purchaser of real estate, in the first place, because small holders will hesitate to persist in obstinate demands for too high a price in the face of the competition that so powerful a company can give. If such holders won't sell at any fair price, they might be induced to come in and accept shares of the new corporation. Even with its great capitalization, the United States Company could not, of course, control any large portion of the real estate of New York, and it is proposed to turn over new properties to subsidiary corporations, which will be formed by the parent company.

"There would next be a saving in architects'

charges, contractors' commissions, and in the purchase of materials. The corporation under discussion will probably enjoy peculiar advantage in the construction of steel buildings from the fact that the steel trust president is to be a director. But any corporation erecting one building instead of five upon the same plot of ground would enjoy large economies in this respect. In the building itself there will be greater opportunities for light courts, thin partitions, and economies of space in every particular. The elevator equipments could be very greatly improved, as well as securing the savings incident to the operation of only one plant.

#### ECONOMIES IN MANAGING THE LARGE BUILDINGS.

"In the conduct of these large buildings there will be yet more economies. The layman little realizes the quantity of supplies necessary for the extensive office structures in our cities. Great economies could be effected through large purchases in brick. With a tremendous building under a single management, there could be great division of labor in the matter of janitor service, there would be necessary only one superintendent. The collection of rents could be economized. It would be possible also to place in such a building unusual conveniences for the benefit of the tenants and still preserve the net economies which have been specified. The idea of having a stenographic establishment, a bookstore, a soda fount, a barber shop, a manicure establishment, a dentist, an oculist, a surgeon, a physician, and others in a great office building has already been partly developed. It is possible to do much more."

#### AGRICULTURAL TRAINING FOR WOMEN.

THE Countess of Warwick is at the head of a movement in England which has for its object the education of the "daughters of professional men with large families and small incomes." In establishing the so-called Reading Hostels the object of the countess was twofold. She wanted to make a new opening for educated women by training them in the lighter branches of agriculture, and at the same time to benefit the farming interest by raising an army of trained women to do battle in its service. The first of the Reading Hostels was opened in 1898, and accommodates twenty-four students. Brook House, opened in 1899, accommodates fourteen, and the Maynard Hostel sixteen. In 1900, a pair of six-room cottages were built, and two large greenhouses erected. There were nine and a half acres of land rented for practical work. The students are instructed in gardening, poultry-rearing, bee-keeping, and dairying. They

have no laboratories, however, so that all scientific work has to be done at Reading College, which is very dear.

Lady Warwick started with a capital of £1,500, but now the time has come for launching out on a larger scale. She wants £30,000 to build an agricultural college for women. The appeal in the *Times* and at the Mansion House only brought in £600. The fees for the students at the hostels which are already opened vary from £65 to £126 a year, including board and residence and training. Starting with 12 students in 1896, 168 have now attended a longer or shorter course of training. Lady Warwick would like to fix a minimum limit of two years for training, but she would not exclude short courses, and lectures are given to non-resident students in the neighborhood. Every student who has been through the full course of training has obtained a salaried post on leaving.

#### A COLLEGE AND "SETTLEMENT" SCHEME.

To help on the movement she has founded an agricultural association for women, with the *Woman's Agricultural Times* as its official organ. This association, started in February, 1899, now numbers thirty patrons and one hundred and thirty-two associates in many parts of the world. Her dream for the future is that several women should take a cottage and several acres of land to start with, so as to form women's agricultural settlements in various parts of the country. She would have them work it on the allotment system as a market garden, or horticultural farm, or small dairy farm, combined perhaps with bee-keeping or fruit-growing. Three students have already applied for cottages next year. She has opened a new department of work at Reading this year for colonial training. The course extends over one year, of which three months will be devoted to each of the following groups:—cooking, housewifery, laundry and dressmaking, dairy and poultry-farming, flower, fruit, and vegetable gardening. The students are taught to find substitutes for every-day necessities, such as making their own yeast from the potato. Their training, in fact, will consist very largely in doing without things. With the £30,000 endowment Lady Warwick says an agricultural college could be founded which would take in between fifty and sixty students under one roof. They could build their own laboratories, supply their own teachers, and rent two hundred acres of ground, on which all the practical work could be done.

Lady Warwick makes her appeal to the British public through the pages of the *New Liberal Review* for August.

### THE FIRST PUBLIC MAN INTERVIEWED IN ENGLAND.

"WHO was the first public man ever interviewed in England?" Sir Wemyss Reid, in *Great Thoughts*, says it was Mr. W. E. Forster, about 1880 or 1881. And Mr. W. T. Stead was the interviewer.

"Mr. Stead interviewed Forster on his return from the East. Mr. Forster came to see me immediately after the interview appeared, and I reproached him for having countenanced such an abominable innovation from America. We had a long discussion, and in the end agreed that while the ordinary interview was not a thing to be encouraged, yet that the interview in which a man stated his views on some great topic of interest might be useful to the person interviewed and to the public generally."

Mr. Forster, however (says *Westminster Gazette*), was much blamed at the time for having submitted to being interviewed.

As the subject seems to be of some interest, Mr. Stead himself recalls, in the *English Review of Reviews*, the circumstances in which this first interview took place:

"Mr. Forster had just returned from a visit to Bulgaria. I called upon him, and after a long talk, I said I thought what he said was very interesting, and ought to be made known to the public, and asked for his permission to jot down what I remembered of his conversation, to publish it in the *Pall Mall Gazette*, offering at the same time to send him a proof. When I wrote out the interview, knowing the prejudice to which Sir Wemyss Reid referred, I did not venture to print it as an interview with Mr. W. E. Forster. I simply guarded his susceptibilities by describing him in the proof as 'an English public man who had recently returned from the East.'

"When Mr. Forster got the proof, he returned it to me with a few corrections, striking out 'an English public man,' and putting in his own name. He said to me:

"Don't you think that the chief importance of my observations is that they are my observations, and therefore ought to be published in my name?"

"I said of course I thought so, but I never thought he would stand it, because there was such a prejudice against interviewing public men.

"Well," said Mr. Forster, 'I understand that prejudice, but I think there are very great advantages for public men in the interview. It enables one, for instance, to air ideas or to send up a *ballon d'essai* without making one's self definitely responsible for them in the form in

which they are expressed. At the same time,' he continued, 'I think it is only right to the man interviewed that he should always have an opportunity of revising his interview in proof, on the strict understanding that the public should never be told that he had seen the proof. Otherwise, if he is known to have revised the proof, he is liable to be held to any statements therein contained almost as much as if he had written them with his own hand.'

"There is much good sense in this; and, excepting where it has been absolutely impossible, I have always submitted proofs of interviews to the interviewed, and have never proclaimed the fact, unless with their permission, that the interview had been revised by its subject."

### SWINBURNE ON DICKENS.

THE times indeed are changing when the *Quarterly Review* allows one of its contributors to sign his contribution. This novel departure for the *Quarterly* has been made in honor of Mr. Swinburne, who fills twenty pages of the July number with an appreciation of the work of Charles Dickens. It is interesting, but it possesses little of the charm of the best of Mr. Swinburne's prose and verse. Its interest, indeed, lies more in the judgments which he expresses than in the style in which his criticisms are couched. As usual, Mr. Swinburne is somewhat lavish in his laudation, but, contrary to his wont, he uses the lash but sparingly.

#### "THE CHILD'S HISTORY OF ENGLAND."

His severest censure is reserved for the "Child's History of England." He says:

"I cannot imagine what evil imp, for what inscrutable reason in the unjustifiable designs of a malevolent Providence, was ever permitted to suggest to him the perpetration of such a book."

What ailed him in this book was its "cheap-jack radicalism." But Mr. Swinburne reserves his chief scorn for those who have adversely criticised Dickens. Those who deny truthfulness and realism to the imagination of genius of Dickens are "blatant boobies." "The incredible immensity of Dickens' creative power," he says, "sufficed for a fame great enough to deserve the applause and the thanksgiving of all men worthy to acclaim it, and the contempt of such a Triton of the minnows as Matthew Arnold."

This is nothing to what he says of George Henry Lewes, whose criticism provokes him to speak of the "chattering duncery and the impudent malignity of so consummate and pseudo-sophical a quack as George Henry Lewes. Not even such a past master in the noble science of

defamation could plausibly have dared to cite in support of his insolent and idiotic impeachment either the leading or the supplementary characters in 'A Tale of Two Cities.'

"DAVID COPPERFIELD" AND "GREAT EXPECTATIONS."

But Mr. Swinburne cannot stand Little Nell. "She is a monster as inhuman as a baby with two heads." He does not think very much of "Nicholas Nickleby;" he does not consider "The Old Curiosity Shop" is in any way a good story; and he is not enthusiastic about "Dombey and Son." But of almost all the other novels he

ALGERNON CHARLES SWINBURNE.

has nothing but unstinted praise. Dickens' two best novels, Mr. Swinburne thinks, are "David Copperfield" and "Great Expectations." Of "David Copperfield" he says:

"From the first chapter to the last it is unmistakable by any eye above the level and beyond the insight of a beetle's as one of the masterpieces to which time can only add a new charm and an unimaginable value."

For the perfect excellence of this masterpiece he finds no words too strong. The story, he says, is incomparably finer than "Great Expectations." There can be none superior, if there be any equal to it, in the whole range of English fiction, except "Vanity Fair" and "The Newcomes," if even they may claim exception. There can surely be found no equal or nearly equal number of living and ever-living figures.

DICKENS' LAST GREAT WORK.

"Great Expectations" was Dickens' last great work. The defects in it are nearly as imper-

ceptible as spots on the sun or shadows on a sunlit sea.

"Barnaby Rudge" can hardly, in common justice, be said to fall short of the crowning phrase of being a faultless work of creation. In "Martin Chuzzlewit," that neglected and irregular masterpiece, his comic and his tragic genius rose now and then to the very highest pitch of all. Sairey Gamp has once again risen to the unimaginable supremacy of triumph by revealing the unspeakable perfection of Mrs. Quickly's eloquence at its best. He says:

"We acknowledge with infinite thanksgiving, of inexhaustible laughter and of rapturous admiration, the very greatest comic poet or creator that ever lived to make the life of other men more bright and more glad and more perfect than ever, without his beneficent influence, it possibly or imaginably could have been."

But Mr. Swinburne again and again returns to "David Copperfield," "which is perhaps the greatest gift bestowed on us by this magnificent and immortal benefactor."

PRAISE FOR "A TALE OF TWO CITIES."

"A Tale of Two Cities," he says, is the most ingenuously and inventively and dramatically constructed of all the master's works, but "Hard Times" is greater in moral and pathetic and humorous effect. Of "A Tale of Two Cities," Mr. Swinburne says that "this faultless work of tragic and creative art has nothing of the rich and various exuberance which makes of 'Barnaby Rudge' so marvelous an example of youthful genius in all the glowing growth of its bright and fiery April; but it has the classic and poetic symmetry of perfect execution and of perfect design."

Of "Little Dorrit," whom he describes as "Little Nell grown big," he says it contains many passages of unsurpassable excellence. "The fusion of humor and horror in the marvelous chapter which describes the day after the death of Mr. Merdle is comparable only with the kindred work of such creators as the authors of 'Les Misérables' and 'King Lear,' and nothing in the work of Balzac is newer and truer and more terrible than the relentless yet not unmerciful evolution of the central figure in the story."

DICKENS AND THACKERAY.

Comparing the posthumous fortune of Dickens and Thackeray, Mr. Swinburne says:

"Rivals they were not and could not be; comparison or preference of their respective work is a subject fit only to be debated by the energetic idleness of boyhood. In life Dickens was the more prosperous; Thackeray has had the better fortune after death."

## RUSSIA IN MANCHURIA.

**N**OTWITHSTANDING Russia's formal evacuation of Manchuria, there are not wanting signs that the country will remain, commercially and industrially, to a great extent Russianized. A French traveler lately returned from that part of the world does not hesitate to call it Russian Manchuria. This traveler, M. Legras, records his impressions in the first July number of the *Revue des Deux Mondes*. M. Legras seems to have been allowed to go pretty much where he pleased, and the impression which his journey made upon him may be thus summarized. His first idea was that the Russians had been guilty of a capital mistake in leaving nearly three thousand kilometers of their great railway at the mercy of a population which has not submitted to them. It is true that they have accumulated troops, and have signed treaties stipulating for the protection of their interests, but at the same time it is not less true that they cannot be secured against a sudden cutting of the railway or against various attempts upon their interests. The Russians have run this risk for various reasons, of which the most important are two, the one commercial and the other political.

## THE RAILROAD.

The Trans-Siberian Railway is a sort of hybrid ; in its origin, whatever may be the official version, it was a purely military line, and was planned in consequence of the warnings of various governors-generals of eastern Siberia, who had always made a great point of the danger which this unarmed Russian colony was running face to face with China, and destitute of quick communication with the capital. The belief in the commercial success of the enterprise was at first extremely small, so much so that the stations were placed at great distances from one another, and only at points where a fair amount of traffic might be reasonably expected. In spite of all, however, the traffic of the Trans-Siberian Railway grew and grew. The little stations had to be multiplied by two, and even then were not enough.

## WILL RUSSIA MONOPOLIZE MANCHURIAN COMMERCE ?

M. Legras shows that the continuation of the Trans-Siberian Railway through Manchuria is really a sign of the pacific intentions of the Russian Government. He also makes it clear that the evacuation of Manchuria by the Russians does not extend to the railway, which will continue to be guarded by Russian troops. Russian occupation will continue to be a reality in the sense that Russia will proceed to develop the resources of the country in partnership, so to speak,

with native proprietors ; a method which secures to Russia the fruits of annexation without any of the responsibilities. It is this which will prevent Russia from permitting any commercial competition in Manchuria. The conditions under which the railway has been built were so contrived as to make it against the interest of China to grant concessions for railways without injuring her own interests, so M. Legras comes to the conclusion that Russia has nothing to fear in Manchuria so long as peace is maintained. Of course there is the risk of local troubles, and in the event of a general conflagration, such as he holds might result from the establishment of the Japanese in Korea, both the economic and the military situation would be threatened.

## PIERRE LOTI'S TRAVELS IN INDIA.

**M.** PIERRE LOTI contributes to the second July number of the *Revue des Deux Mondes* a long and exquisitely written paper of his experiences in the territory of the Maharajah of Travancore. It was his privilege to see that delightful, intimate India, where the tourist does not penetrate, and he sings its praises in French so exquisite that to attempt to translate it seems almost a sacrilege. The great Indian temples, with their innumerable series of pillars, and their colossal statues of gods and goddesses, naturally make a profound impression upon this writer, so sensitive to beauty in all its forms.

## JEWS AND CHRISTIANS UNDER BRAHMIN RULE.

Suddenly he sees in the shade of a banyan tree, near an ancient idol of Siva, a personage in a violet robe, with a long white beard, calmly sitting down reading. Actually it is a bishop, a Syrian bishop, but how strange to see him in this country of the mysteries of Brahmins ! Yet it is really perfectly natural, for the Maharajah of Travancore has about half a million Christian subjects. These do not represent the triumph of modern missionary effort ; their ancestors built Christian churches here in epochs when Europe herself was still pagan, for these assert that Christianity was brought here by St. Thomas, who came to India about the middle of the first century. It is, to say the least of it, more probable that they are descended from Nestorians who emigrated from Syria. Not less interesting is the fact that in the north of Travancore are to be found descendants of Jews who emigrated after the second destruction of the Temple at Jerusalem. It is pleasant to relate that under the benign rule of the Maharajah there are no religious feuds ; each religious community practices its faith in peace and toleration.

## AN INTERVIEW WITH THE MAHARAJAH.

M. Loti has the seeing eye of the true traveler, and it is impossible to do more than mention a few of the scenes which aroused his interest and inspired his pen. He describes the remarkable Zoological Gardens at Trivandrum, where the fauna and flora of India are preserved under conditions absolutely similar to the undisturbed jungle. He visits the Maharajah himself, and rejoices that this prince has had the good taste to remain Indian, and not to assume the ugly Western dress. M. Loti was intrusted with the mission of presenting to his Highness a French decoration, and when he had discharged this duty he conversed with the Maharajah about Europe, which the prince is prevented from visiting by the strict rules of his caste. He also talked with the Maharajah on literary subjects, and found him a man of cultivated and refined intelligence. Some days afterward M. Loti was presented to the Maharanee; this is not the wife, but the maternal aunt of the Maharajah. In Travancore, names, titles, and property are inherited on the female side; indeed, in this state women have actually the privilege of repudiating their husbands at their pleasure.

## THE FUTURE OF THEOLOGY.

UNDER the title of "Theology as a Science," Dr. Paul Carus contributes a very thoughtful article to the *Monist* for July. It is a very metaphysical article, and one the phraseology of which would be incomprehensible to the general reader. He believes that theology has a future, but he would prefer to call it theonomy, in order to differentiate it from theology, as astronomy is differentiated from astrology. This theology of the future is a new science, the roots of which lie partly in philosophy, partly in the scientific treatment of history, partly in ethics, partly in an application of art, and partly also in poetry and *belles-lettres*, the religious literature being, to a great extent, hymns and recitals. The basis of this theonomy is the same as that of theology,—namely, an appreciation of the factors that shape our ends; that is, God. The name of God, says Dr. Carus, remains quite as appropriate for the new conception of the eternal norm of being as it was for the old. Here is the theonomical definition of God:

"Moreover, the eternal norm of being is actually a harmonious totality of laws of nature, a system of truths, a spiritual organism, or a body of immaterial influences which condition all the details of becoming, and these creative factors of life are omnipresent as they are non material;

they are eternal as they are indelible; they are immutable as they are perfect, and beyond the possibility of being improved, forming the unchangeable bedrock and ultimate *raison d'être* of existence."

Theonomy is not merely philosophy; it is also based upon a study of the positive forms of historic religion. It is a grand and noble science, and the scope of its development is an infinite potentiality. Dr. Carus believes that the future will not be less religious, but more religious, and that our religion will be purer and nobler and truer. The horizon of religion is expanding, and when theology becomes theonomy the old orthodoxy is not surrendered, but fulfilled and completed.

## THE WESTMINSTER STANDARDS.

Discussing the attitude of the theonomist to the creeds of the existing churches, Dr. Carus asks what may be done to meet the difficulties felt by the Presbyterians who recently attempted to revise the Westminster Confession of Faith. He answers the question by declaring that he would not revise the confession of faith, but would define it in such terms as to bestow the necessary liberty of conscience on Presbyterian ministers, without involving the change of a single letter in the Westminster Confession, and without causing a break in the historical tradition of the Church. A method by which he would effect this is to draw up the following preamble and resolution, which would be a substitute for the present declaration of adhesion to the Presbyterian creed:

*Whereas*, divine revelation is the unfoldment of truth;

*Whereas*, God speaks to mankind at sundry times and in divers manners;

*Whereas*, Jesus Christ spoke to us in parables, and the Christian confessions of faith are, as their name implies, symbolical books;

*Whereas*, religion is a living power and life means growth;

*Whereas*, that is the true light which lighteth every man that cometh into the world; and, finally,

*Whereas*, centuries of unparalleled growth have added much to our better comprehension of religious truth;

*Therefore*, be it resolved that we, the duly elected representatives of the Presbyterian Church, declare—

That we regard the Westminster Confession of Faith and other formulations of belief in ages past contained in the symbolical books as venerable historical documents which were, from time to time, on certain occasions, and for specific purposes, composed by the legitimate and legally appointed representatives of our Church;

That we justify the spirit in which they were written, but deny that they were ever intended to bar out from us the light that the higher development of science and the general advance of civilization would bring;

That we bear in mind that the symbolical books are symbols, and that we have learned that a freer scope for their interpretation in the light of the maturest science of our age will do no harm to the essential doctrines of our faith.

Dr. Carus' paper is instinct with faith and remarkably conservative for so staunch a radical; but, as Dr. Carus says, "the very recognition of evolution as an essential truth in the interpretation of the development of man teaches me to be conservative."

### THE FUNCTION OF WATER IN THE HUMAN BODY.

AN interesting, if somewhat technical, article on the functions of water in the human body is contributed to the July number of the *Deutsche Revue* by Prof. Karl B. Hofmann. Teleologically considered, the quantity of water in the body corresponds to its many functions, being greater than that of all other substances composing the body put together,—namely, two-thirds of its entire weight, or leaving out the skeleton, three-fourths of that of the soft parts and fluids, 55 per cent. falling to the share of the muscles alone. The amount, however, varies in the course of life, being much greater in early infancy, diminishing in the prime, and increasing again somewhat in old age. Some animals, as medusas and similar marine creatures, consist almost entirely of water, which constitutes 95 per cent. or even 99 per cent. of their substance. The functions of water are both physical and chemical.

#### PHYSICAL FUNCTIONS OF WATER.

"The flexibility of the spine depends on the intervertebrate elastic disks, which can absorb a great deal of water without losing their consistency; they also serve to soften the concussion that would otherwise be felt by the spine and the head, respectively, the brain, in walking, jumping, dancing, etc. It is a matter of common observation that a person who has been sick in bed for some weeks increases about  $1\frac{1}{2}$  centimeters in height, since these disks have absorbed more water during that period of rest. . . . Not only the shape of the various tissues largely depends on their power of absorbing water, but also their physical qualities, that are most important in the performance of their functions, such as their toughness, elasticity, and power of resisting pressure and pull,—qualities that enable the arteries to bear the impact of the blood wave, and the minute capillaries to adjust themselves to changes of temperature by contraction or expansion. The water in the tissues prevents friction on close

contact. If muscles and ligatures contained little or no water, the movements of the limbs and locomotion of the body would be greatly restricted, if not impossible altogether. The suppleness of every single cell of tissue depends on inhibition.

#### CHEMICAL FUNCTIONS OF WATER.

"Chemically considered, water is either a solvent in which the chemical processes take place, or itself a substance that acts chemically. This function demands fullest recognition, since hundreds of chemical reactions, parallel with or crossing each other, accompany every expression of life, from simple muscular movements to the least stirrings of the soul. The sum total of these chemical processes, the 'transmutation of matter,' is impossible without the mediation of water. *Corpora non agunt nisi fluida* (bodies act only in a fluid state) is an old chemical maxim entirely applicable to our organism. But here water is all the more valuable as a solvent, since our body has no other solvents at command,—e.g., ether, alcohol, chloroform, etc.,—as used in the laboratory, aside from the fact that nearly all the substances in question are insoluble in those fluids.

#### HOW WATER ENTERS THE BODY.

"Most of the water is taken into the body in the food, solid as well as liquid, and in beverages. The Greek physicians argued the question whether water is a food or not. If the term 'food' is taken to mean substances that nourish the body and provide the motive power for its various functions, water cannot be classed among them. But if the term include all those substances without which chemical energy could not come into play, without which life must therefore cease, then water certainly is a food. Water, on entering the stomach, is probably not at all absorbed there, acting merely as a medium in which the chemical changes take place. If it were absorbed while still in the stomach, the digestive process could not be properly accomplished in the small intestines, where it is needed; but when that process is practically completed in the large intestines, the water, having fulfilled its task, is ready to enter the blood. Even a layman may gather from this how irrational it is to take large quantities of fluids, as soups or beverages, during meals, especially in case of sluggish digestion or enlargement of the stomach, as digestion is retarded if the digestive fluids are too much diluted. Water should be taken two or three hours after meals,—when, in fact, a feeling of thirst arises.

## WATER IS A THERMO-REGULATOR.

A highly important function of water, finally, is that of regulating the temperature of the body, cooling it by evaporation from lungs and skin, and by perspiration. Bodily comfort depends on this regulation. Persons who do not perspire easily suffer more from heat. An increase over the normal temperature of 98 per cent. cannot be endured for any length of time. In high fever the bodily heat becomes unbearable on account of the disturbed regulation, and relief is experienced on perspiration. "We should appreciate the economic importance of water more," the writer concludes, "if it cost as much as the food we prepare in it. It is fully appreciated only by the traveler in the desert, who must carry it along for himself and his animal."

## ALCOHOL AS FOOD OR POISON.

THE current discussion of the alcohol question among scientists is a most significant one to physiology, for it involves the question as to whether a substance may be both nutritious and poisonous in the same organ at the same time, and the answer gives light on two fundamental biological problems,—namely, the function of nutrition and the manner in which the injurious effects of poisons are brought about.

## EXPERIMENTS ON DOGS.

An investigation reported by Professor Kassowitz, in the last number of the *Archiv für die gesammte Physiologie*, was carried out by means of experiments upon dogs, which were given definite amounts of food and required to do certain work each day. During periods of several days the weight of the dogs, and the amount of work done varied greatly, according to the alcoholic or non-alcoholic nature of the food given. The dogs were placed in a running machine, and the distance run by each dog was recorded.

During the first week the dog that was given food without alcohol ran 10.888 km. per hour, while its mate, kept on the same kind of food plus alcohol, ran only 7.847 km. per hour, and showed a loss of weight at the end of the week, while the first dog had gained in weight. During the following week the work was reduced on account of warm weather. The first dog ran 7.794 km. per hour, the second dog, supplied with alcohol, 6.901 km., and there was a difference of weight of 1,205 g., against the alcohol-fed dog.

A number of dogs were subjected to similar experiments, equal quantities of food being given to each dog, with alcohol in addition for one dog, and the experiments were kept up for several weeks in order to get at the true value of alcohol as a source of energy. The results were uniformly against the alcohol-fed dog, both as to the amount of work accomplished and changes in weight.

The author also cites results obtained by other investigators. Rosemann found from his own experiments that alcohol possesses no power of building up the albuminous substances of the body. Chanveau, in Paris, placed a 20 kg. dog in a running machine, and recorded the amount of work done when it was given alcohol and when it was not. The alcohol-free period lasted fifty-four days, during which time the dog was given 500 g. of raw meat and 252 g. of cane sugar daily. The dog ran two hours a day, and averaged 24 km. It was well at the end of the period, and had gained about one-fifteenth of its original weight. For the following twenty-seven days the food was unchanged, except that one-third of the sugar ration was replaced by alcohol. As a result, in spite of coaxing and whipping, the average distance run per day was 18.6 km., instead of 24 km., or about 21 per cent. less, and the dog had lost weight.

## CONCLUSION: ALCOHOL NOT A NUTRITIVE SUBSTANCE.

The author believes that the idea of the nutritive value of alcohol comes from the supposition that a part of the food may be oxidized directly without first taking part in the building up of protoplasmic substance. He believes that no food material can be used in the body without first being converted into protoplasm. Since alcohol, as a stimulating and poisonous substance, destroys the highly complex and unstable protoplasmic molecule, it cannot at the same time be assimilated by it, consequently it cannot act as food and poison simultaneously.

After a short time alcohol paralyzes the center of innervation for the muscles, and therefore by diminishing the amount of muscular action, the secretion of carbonic acid is lessened. This diminished secretion, therefore, means no saving of the tissues of the body, but is a direct result of the poisonous action of alcohol. From all the evidence, it seems apparent that alcohol cannot serve for nutrition in any instance.

## THE PERIODICALS REVIEWED.

### THE CENTURY MAGAZINE.

THE *Century* for September begins with an account by James D. Hague of his personal experiences in "Our Tropical Islands." It may not be generally known that we have these islands in the mid-Pacific, and have had them for forty-five years. They are small, low islands, of coral formation, some of them with valuable deposits of phosphates. Some of them have now a further importance from the fact that the United States has become a Pacific power. Jarvis Island, for instance, lying nearly due south from Hawaii, is conveniently situated on the lines connecting the Pacific coast of the United States with Australia or New Zealand, and touching Hawaii and Samoa. The same thing is true of Baker's Island. Jarvis Island, which is typical of these little specks of dry land in the great Pacific, lies twenty-two miles south of the equator, is one or two miles long, and less than a mile wide, with an area of perhaps a thousand acres. Mr. Hague gives an interesting description of the equatorial birds found in great numbers around these islands, such as gannets, frigate-birds, tropic-birds, gulls, terns, and other species better known in northern latitudes.

### A VISIT TO THE EMPRESS DOWAGER.

Belle V. Drake, in "A Visit to the Empress Dowager," gives a good picture of that notable little lady, and an account of the first New-Year's audience given by the Empress to the ladies of the diplomatic corps. The Empress Dowager served tea to her European guests first; she was attended by twenty-five princesses. "The Empress Dowager was dressed in the national costume, consisting of a long, loose, sack-like garment reaching from the neck to within about three inches of the floor, over which is worn a short, sleeveless jacket. They were made of blue satin exquisitely embroidered all over in figures of butterflies, bats, characters in gold denoting long life, and flowers, all in harmonizing colors. Her hair was dressed in the Manchurian extension fashion, and adorned with dozens of pearls, of varying sizes, from a penny down to a pinhead. Her feet were prettily dressed in the embroidered Manchurian shoes perched on brackets, so that she seemed taller than she really was, for she cannot be quite five feet tall. None of the ladies had small feet. The younger ladies wore differently colored gowns of the same style as the Empress', with large clusters of brightly colored flowers in their hair, and, with only a few exceptions in the case of widows, their faces were most artistically painted, a study in pink and white, with a single blood-red spot on the lower lip. The effect of this kaleidoscopic coloring can be better imagined than described."

### THE LATE MR. GODKIN.

Mr. Joseph R. Bishop, in "Personal Recollections of E. L. Godkin," says of the late editor of the *Evening Post* that "if he was a pessimist, he was the most cheerful and the most delightful one that the world, at least my part of it, has ever known. If ever there was a life of intellectual freedom, it was the life that had him for its center and moving spirit." Mr. Robert T. Hill contributes "A Study of Pelée," from the experi-

ences of his trip to Martinique just after the destruction of St. Pierre; Prof. I. C. Russell writes on "Phases of the West Indian Eruptions," and gives the opinion that the immediate cause of death to the thousands in St. Pierre was the steam and the hot dust with it, and not burning gas; there is a study of William Watson, by Prof. George E. Woodberry, and an essay on betting, by President Arthur T. Hadley, of Yale University.

### HARPER'S.

MR. T. E. BLAKELEY, writing in the September *Harper's* on "Macaulay's English," assumes that there is no dissenting voice to the opinion that "in Macaulay's 'History of England,' the English language has been written more clearly and correctly than in any great literary composition of the nineteenth century." "I spent," said Macaulay, speaking of his history, "nineteen days working over thirty octavo pages." Again he says, "In two years from the time I began writing I shall have more than finished the second part (vols. iii. and iv.), then I reckon a year for polishing, retouching, and printing." Each page as it was printed was again carefully revised and corrected. After all this toil; after the first four volumes were printed; after they had been received with a welcome more enthusiastic than had ever been given to any serious literary work; after fifty-six tons of vols. iii. and iv. had failed to meet the first demand in England; after the fiercest criticism had failed to lessen the popularity of the work; after the purity and clearness of the English had been universally recognized—he sat down to undertake a complete and thorough revision of the four volumes, making a thousand corrections in spelling, grammar, punctuation, the use of capitals, arrangement of words in sentences, omitting words in some places, inserting them in others, adding sentences and whole paragraphs, and making some alterations in small details."

### AN ENLIGHTENED INDUSTRIAL ESTABLISHMENT.

Dr. Richard T. Ely follows up his economic study of the town of Pelzer, S. C., as one type of industrial establishments which seek a betterment of the wage earner's condition, with a sketch of the methods of a Cleveland establishment, the Sherwin-Williams Company, manufacturers of paints and varnishes. He describes the provisions for light, air, and cleanliness that have enabled men to work for years in a trade which formerly broke them down in a short time. Rest rooms are provided for the girls, and two floors of the building are devoted to lunch rooms, where wholesome meals are served at a very small cost. When night work is required, the company furnishes dinner at its own expense. Reading rooms are provided and furnished with books and periodicals; a monthly magazine is published by the company, and employees contribute to it. A mutual benefit association provides relief in cases of sickness or death, and more than nine-tenths of the employees belong to it. Dr. Ely thinks this establishment is typical of what is going forward in the most enlightened industrial centers of America.

This number of *Harper's* contains two remarkable

efforts of color illustration; the first, three bold-hued reproductions of Mr. E. A. Abbey's "Quest of the Holy Grail" pictures, is less successful than the delicately toned bits of seashore and sand dunes accompanying Sadakichi Hartmann's "A Reverie at the Seashore." The latter go far toward proving that colored pictures in magazines are worth while.

#### MCCLURE'S MAGAZINE.

**M**R. L. A. COOLIDGE'S sketch of Attorney-General Knox, in the September *McClure's*, is quoted from in another department.

#### CUBA'S CHANCES FOR 15,000,000 POPULATION.

The magazine begins with a discussion of "Cuban Reciprocity—A Moral Issue," by William Allen White. Mr. White quotes General Wood to the effect that Cuba will easily sustain a population of 15,000,000, instead of the 1,500,000 people now on the island, and he expresses his own opinion that if the United States fulfills her obligations, and allows Cuban industries to thrive as they thrived under the McKinley Law of 1890, the population of the island will rise toward the 15,000,000 point rapidly. The increase must be largely American. The American population will make an American Cuba. The political alliance may come soon, or it may come late; but if the commercial alliance is made under the proposed reciprocity measure, the political alliance is inevitable. Mr. White thinks that even if a reduction in the tariff does reduce the price of sugar, "as the beet-sugar people wrongfully claim," it would be better to save each American householder a few dollars a year on his sugar bill than to continue protecting an industry like beet sugar, which, according to the prospectus issued by the Oxnard beet-sugar people, is making nearly 100 per cent. profit on its investment.

#### STUDENTS OF THE MARTINIQUE DISASTER.

There is an excellent article on "Pelée, the Destroyer," by Mr. August F. Jaccaci, who, in company with George Varian, the artist, and Mr. George Kennan, were the first to establish headquarters and live under the shadow of the volcano as soon as they could get to Martinique after the news of the great eruption of May 8 came. During their stay they explored the mountain on all sides, witnessing the various phenomena of several eruptions, from the last of which they narrowly escaped. Mr. Jaccaci's description is illustrated with the drawings of Mr. Varian from sketches that artist made on the spot.

There is a further chapter of Miss Ellen M. Stone's account of her captivity among Bulgarian brigands, a second installment of Santos-Dumont's history of his aeronautic experiences, and several contributions of fiction and verse.

#### SCRIBNER'S.

**M**R. WALTER A. WYCKOFF, whose descriptions of personal experiences among "The Workers" of America attracted so much attention in *Scribner's Magazine*, has been studying London laborers at first hand, and contributes to the September number an article on "London Wage Earners." He concludes that Great Britain is to-day exceedingly prosperous. "I venture to say that not since the fifteenth century has the prosperity of England been more generally shared among her working classes.

The unemployed—except the unemployable—have disappeared, absorbed by the increased demand for labor in both town and country industries; while for the great body of wage earners, one has but to see them as they live and work by hundreds of thousands in East London in order to realize how hardy and well nourished and well clothed and well schooled a race they are, and how decisively skilled—forming, as I think, an industrial army of rare efficiency."

#### DINING WITH THE KING OF KINGS.

"Through the Country of the King of Kings" is a travel sketch of Abyssinia by W. F. Whitehouse, who describes with interesting detail a banquet given by Menelik, "King of Kings and Conquering Lion of Judah." "The Negus seated himself on the throne, which was surrounded by court officials and attendants. At his right lay a large pile of flat bread, on a table covered with a white cloth, and decorated with flowers. On either side of the dais, which was curtained off from the rest of the hall by thin, flowery-patterned chintz, stood two silver candelabra, eight feet high, holding sixteen lighted colored tapers. The guests, consisting of the various residents and ourselves, were placed at two tables on the Emperor's left, set with massive silver knives and forks, marked with the imperial M. While we ate our well-cooked dinner of many courses, a number of dishes were carried to the Negus. Of some he partook; others, merely touching, he sent to the chief officers sitting about him. Before each of these groups stood an attendant holding up a great piece of raw beef, killed that morning, from which the guests cut strips with a sharp knife, and placing one end in the mouth, cut off the remainder. Each person had a decanter of honey-beer by his side."

Mr. L. E. Fournier describes, in "Prix de Rome Students at the Villa Medici," the life of the prize students in art, sent each year by France to Rome, to study at the Villa Medici. Mr. R. H. Davis concludes his serial story, "Captain Macklin," and there is a second installment of Mr. James M. Barrie's "The Little White Bird," a tale of London life in which the author of "The Little Minister" has renounced dialect.

#### THE COSMOPOLITAN.

**A**N unusually interesting group of sketches of "Captains of Industry" appears in the September *Cosmopolitan*, brief articles on John W. Gates, H. H. Rogers, Sir Hiram Maxim, John H. Patterson, of Dayton Cash Register fame; Charles R. Flint, "the father of trusts," and John Arbuckle, the canny Scotch opponent of the Sugar "Trust." Mr. Samuel E. Moffett, in his sketch of John Arbuckle, shows how the mighty fight between coffee dealers and sugar dealers originated in the refusal of the Sugar Trust to sell sugar for sweetened coffee to the Arbuckles except at list prices. "The Arbuckles delivered an ultimatum, 'Give us fair terms or we will go into the sugar business on our own account.' 'There seems to be money in roasting coffee—we may try it;' responded Havemeyer. The war was on." Mr. Moffett says that up to 1900, when a territorial agreement was arrived at, the war had cost the belligerents some twenty-five million dollars.

#### THE GROWTH OF TUSKEGEE.

Mr. Booker T. Washington discusses some "Problems in Education" in an account of the small beginnings

and the splendid development at Tuskegee. He says: "We began teaching agriculture in 1882 with one hoe and one blind horse. At the present time the school cultivates by the labor of the students seven hundred acres of land, and grows a large part of the food consumed by the one thousand four hundred students, instructors and families, upon the grounds."

#### THE SIMPLE TASTES OF THE CZAR.

Mr. Fritz Morris describes the very simple home life of the Czar of all the Russias and his family. The Czarina dresses like an English lady, and the Czar, too, dresses in a simple Russian costume in the palace. He rises at 8, and his toilet lasts until nearly 9 o'clock, when he sits down at his writing table to discharge such important matters of state as do not admit of delay. From 10 until 11 o'clock he enjoys a short rest, during which he partakes of luncheon, and then the time is again devoted to work,—to the signing of documents, to the study of bills and the reports of the ministers and governors, to which he adds numerous marginal remarks. From 1 to 4 is devoted to the family, and from 4 to 6 or 7, work again. The dinner is extremely simple, and the Czar abhors banquets.

#### MUNSEY'S.

UNDER the title "A City of the Plains," Mr. Grover Townshend writes in the September *Munsey's* about "Zion City," the creation of John Alexander Dowie and his religious followers. Mr. Townshend thinks Dowie will be reckoned among the great organizers of the world; he has founded on the shores of Lake Michigan a city designed to house a million people,—intended by its founder to be a world capital. "To provide the means of expansion, Dowie exacted a tax of one-tenth of the income of all those who accepted his direction. With the sum thus gained he purchased some ten square miles of territory on the shore of Lake Michigan, forty-two miles north of Chicago and the same distance south of Milwaukee. There he planned his City of Zion, and there within the last six months he has settled ten thousand people. Just as in Washington the city radiates from the Capitol, so in Zion the center will be a great white marble temple. From this as a hub, boulevards will spray outward as the spokes of a wheel. Each boulevard will be 300 feet in width, with a central rib of parkway filling one-third of the space. Connecting these main arteries will be the avenues, each one 150 feet wide."

Anne O'Hagan tells, in "The Rescue of the Submerged," of the work of the Children's Aid Society in helping the waifs of the city slums. She thinks the most convincing proof of the admirable results of this system is the fact that of the nearly 23,000 children placed in families, only 60 have been arrested and sent to reform schools. The majority became farmers or farmers' wives. Two have become governors of States, 1 a member of Congress, 26 bankers, 34 are lawyers, 17 physicians, 14 journalists, 19 clergymen, and 956 entered the army.

H. Stanley Todd gives a series of thumb-nail sketches of "The Giant Artists of France;" Carl Hackett shows the remarkable development of the transport service in "How the Soldier Goes to War," and F. S. Arnett celebrates the semi-centennial of the first production of "Uncle Tom's Cabin" with an account of the most

popular actors who have "starred" in that drama since it was first produced at the National Theater, New York, on August 23, 1852.

#### THE WORLD'S WORK.

JOSEPH BLETHEN takes "A Typical Irrigated Community," and shows, in the September *World's Work*, how the farmer bought his land and developed it, and the profit made, and the town which resulted from the aggregation of the irrigating farmers,—thus studying the irrigation question in the light of results. The farmer who goes into an irrigated district has to pay about \$60 an acre, part down, and the balance in five annual payments, at 7 per cent. This includes a water right to his acres, and instead of a water rent he does his share of work every year in repairing and cleaning the ditch. Of a twenty-acre farm, half is marked off to go into alfalfa, which is the staple of all irrigation ranches. Five of these ten acres are devoted to pasturage, and five for cutting. A half-acre is laid off for an orchard for home use, and the balance of the twenty acres is marked off to go into potatoes, peas, onions, and melons, the best crops for a first-year venture. Mr. Blethen pictures his farmer as making \$1,000 besides his living in the second year, and making the last payment on his farm in the third year.

#### BREEDING NEW KINDS OF CORN.

Another article of interest to farmers is Mr. W. S. Harwood's account of the successful experiments in "Breeding New Kinds of Corn," whereby the crop has been increased many millions' worth on the same acreage. At the Agricultural College at Urbana, Ill., Professor Hopkins and his assistants have been recreating the corn plant. They have developed a species for man, another one for animals, and a third for manufacture. They have increased the quantity of protein and the quantity of oil in the grain, and when needed, they have curtailed the supply of oil to give some other element more room. They have told the ear to change its form, so that it should be longer or shorter, or leaner or plumper. They have told the corn plant to increase in height and to decrease in height, and they have even told it that it must weave its leaves on a wider and larger pattern."

#### OTHER ARTICLES OF INTEREST.

A New York clergyman makes a study of the "stranded" portions of our population, and analyzes the different types of broken down and unfortunate and fraudulent that seek advice or money; in "The Highest of All Railroads," Mr. E. C. Rost tells of the engineering problems of the Oroya Railroad in Peru, which leaves the hot tropics eight degrees south of the equator at 8 o'clock in the morning, and arrives up among perpetual snow and glaciers at 4 o'clock in the afternoon of the same day; Mr. C. H. Matson, in "World-Wide Lessons from Kansas Farms," shows how the agricultural experience of a single State has helped farmers all over the earth by the intelligent use made of it by the Secretary of the State Board of Agriculture, Mr. F. D. Coburn; Russell Doubleday traces the great growth of the correspondence school business, and estimates the value of its opportunities for special training in practical studies; another article deals with New Jersey as the "Home of Trusts," showing the workings of the law that has enticed most of the great corporate organiza-

tions to that State; William Bulfin writes on "The United States in Latin America," and Albert B. Paine studies the United States in the course of a journey "By Trolley from New York to Chicago."

#### EVERYBODY'S MAGAZINE.

MR. FRANK NORRIS, the novelist, has been commissioned by *Everybody's Magazine* to visit the territory affected by the coal strike, to give an accurate idea of the conditions of living in the representative mining towns. In the September number of *Everybody's*, Mr. Norris gives the result of his investigations. Mr. Norris says that a great many of the miners have gone away; that nearly 30,000 have left the anthracite district. Some have gone to work on farms, some have turned tramps, and nearly 15,000 have gone back to the old country. As to the wages of miners and the conditions of their life, Mr. Norris found very different conditions in different districts. In the Wilkes-barre district he finds the miners frequently not only owning their houses, but sometimes owning two or three in addition, which they rent to other workmen. He finds that many men in this district earn \$150 a month, with seven hours of drilling per day. They get free medical treatment in case of accident, fuel during the winter at a price ridiculously small, a good home free of mortgage, and steady work. But in Melonsville, a mining settlement three miles from Hazelton, \$50 a month is a good figure, and the Polanders live in houses built of sheet iron and boards, about fifteen feet square, sunk about three feet in the ground. There is but one room, and in this room the family,—anywhere from six to ten humans,—cooks, eats, and sleeps. The miners here complain that it is impossible for them to earn more, because the company will not give them more.

#### MR. BALFOUR'S VIRTUES.

There is an attractively illustrated character sketch of "England's New Prime Minister," by T. P. O'Connor, who has a good deal to say about Mr. Balfour's "detachment" from the life around him. Apart from this, Mr. O'Connor admits that in many ways no man's leadership could be more successful than that of Mr. Balfour. "He has a sweet and pleasant temper, a judicious mind, a tolerant disposition. He desires so far as he can to be at peace with all men. The result is that he is courtesy itself, that his word is accepted with implicit reliance by opponent as well as friend, and that he is the most popular man, personally, in the whole House of Commons."

#### FRANK LESLIE'S.

THE recently exposed Humbert swindle, "the most successful as well as the most fantastic fraud in business history," is traced by Mr. E. P. Lyle, Jr., in the September *Frank Leslie's*. Therèse Daurignac, wife of Frédéric Humbert, was an obscure peasant girl. Her feat was, in brief, that she declared herself worth twenty-four millions of dollars, and kept on declaring it until hard-headed bankers and merchants were willing to lend her ten millions in cash, and enabled her to live in luxury for eighteen years.

Frederick Street clears up the question of "Lightning" as it affects the average observer of summer thunderstorms. These vary in number in different

parts of the country. The middle Atlantic States show the greatest number of deaths from lightning, with an annual average of eleven fatalities for every million inhabitants, but the Mississippi and Missouri valleys and Florida have more thunderstorms.

"The general rules for personal safety in a storm are to avoid standing under or near trees, in the doorways or open windows of buildings, close to cattle or near chimneys or fireplaces. When a person has been struck by lightning, and becomes unconscious, the attempt to revive them should be begun without an instant's delay. Respiration and circulation should be stimulated by warming the body with flannels, and by making the injured person breathe artificially. People have often been revived after being apparently without life for more than an hour."

Cuyler Smith begins the number with an article on "The American Negro," attractively illustrated with photographs of the old-fashioned kind of darkeys we all like to see and know.

#### THE ATLANTIC MONTHLY.

IN the September number of the *Atlantic Monthly*, Mr. W. E. B. Du Bois, writing "Of the Training of Black Men," makes a somewhat impatient appeal for the higher education of the negro. He thinks the fact that only 2,000 negroes have gone forth from schools with the bachelor's degree is a sufficient refutation of the argument that too large a proportion of negroes are receiving high training. Five times as many as these would only reach the average of the country, counting the ratio to population of all negro students throughout the land. "Four hundred negroes in addition have received the bachelor's degree from Oberlin, Harvard, Yale, and seventy other leading colleges." Mr. Du Bois cites the investigations of the Atlanta University Conference into the future of these negro graduates. Two-thirds answered the inquiries, showing that 53 per cent. of the graduates were teachers, 17 per cent. clergymen, 17 per cent. in the professions, 6 per cent. merchants, farmers, and artisans, and 4 per cent. in the Government civil service. Mr. Du Bois thinks this is a record of usefulness that goes far to prove that culture is not thrown away on the negro.

#### A CLEARING-HOUSE UNIVERSITY.

Mr. H. W. Horwill advocates "A National Standard in Higher Education." This he proposes to obtain by the creation of a new university or degree-giving body. He admits that there are already too many universities in America. "That is the reason why one more is urgently needed. The greater the number of banks in the city, the more necessary is a clearing house. It is the multiplicity, not the paucity, of magazines that has brought into existence a REVIEW OF REVIEWS."

Mr. Horwill's "clearing house" university would have a senate composed of a board of experts to draw up a curriculum for degrees, and appoint examiners. Mr. Horwill proceeds to elaborate the plan of his university; its examinations would be open to any one, whether educated at college or out of it, of any sex, race, or creed. There would be no conditions. The candidate would be judged by examinations alone. No degree or certificate would be recognized as giving exemption from any examination. No honorary degrees would be conferred. The university would have its offices in the national capital, with examinations

articles Mr. Henry White's Labor" is deserving of does a temperate and well part played by machinery and the relations which it sustains movement.

## LABOR HAS PROFITED BY MACHINERY.

our attention to one instance in was almost immediately recognized themselves as a boon :

graphical union is a notable example of a accepted a revolutionizing invention table, and thus succeeded in securing a for the operators considerably in excess received by the hand compositors. An officer New York union estimates that each linotype introduced into the newspaper offices displaced men, and that within three years, owing to the in the size of the newspapers and the larger and for printed matter which it encouraged, the laid off have been reemployed, and that to-day the rolls even exceed the former figure. This machine has also had the effect of elevating the standards of the craft, owing to the higher skill and education required. The competition among the employers is such that profits are reduced to a minimum, the public therefore receiving the full benefit of the improvement."

## COTTON MANUFACTURING, NORTH AND SOUTH.

Mr. Henry G. Kittredge presents some of the results of the twelfth census regarding the progress of the cotton manufacturing industry in the Northern and Southern States within the decade, 1890-1900. In the North the principal change in the industry during the decade was in the direction of installing new and costly equipment for the manufacture of the finer grades of cotton, while the manufacture of the coarser fabrics has been largely relegated to the South. In the whole country there was an increase of nearly 5,000,000 spindles in the ten years. About 56 per cent. of this increase was in the South and 44 per cent. in the North. In the North, over 90 per cent. of the gain was in Massachusetts alone, while about 83 per cent. of the South's gain was in the States of North Carolina, South Carolina, and Georgia. The social conditions of factory employees in the cotton mills of the South have apparently improved since 1890, but the proportion of children among the wage earners was as great in 1900 as in 1890, or from 23 to 27 per cent., against 4 to 10 per cent. in New England.

## THE NINETEENTH CENTURY AND AFTER.

THE *Nineteenth Century* for August opens with a sonnet by Mr. Swinburne on the centenary of Alexandre Dumas. It reminds us more of the earlier Swinburne than most of his recent work. We quote four lines :

Man of men by right divine of boyhood everlasting,  
France incarnate, France immortal in her deathless boy,  
Brighter birthday never shone than thine on earth, forecasting  
More of strenuous mirth in manhood, more of manful joy.

## MR. FREDERICK GREENWOOD ON BRITISH EDUCATION.

In an article entitled "What Have We Gained by Education so Far?" Mr. Frederick Greenwood expresses his opinion that England has gained very little by education at a very great cost. He harks back to what he considers was Mr. Forster's early ideal, which he thus describes :

"All education in the 'three R's,' carried out thoroughly in every branch, but especially in the first (so as to impart a full acquaintance with the English tongue), would have amounted to quite as much as is retained after leaving school, in nine cases out of ten. Add to this a system of reading for the purpose of stimulating curiosity or nursing a natural bent, and it would be for most children a better education than they get now. Under such a scheme the voluntary schools would have been carried on quietly and sufficiently, and with what avoidance of contention ! Millions of money raised in discontent, and spent in disappointment and waste, might have found profitable application—even for educational purposes, though of another kind."

## THE FUTURE OF RUSSIA.

M. A. de Bilinski predicts that Russia is going to eat up all Europe, as well as Asia.

"The picture of the ultimate destiny of Russia must show her in the rôle of mistress of Asia and Europe, unified under the action of the Slav leaven. Russia is bound to attain extraordinary greatness, not only through the internal development of her existing empire, but through further expansion. Her dominion, in any case, representing that of the whole Slav race, will stretch from the Arctic and North seas to the Persian Gulf and the Mediterranean, and from the Pacific to the Adriatic and the Oder."

The other nations can hardly be expected to enjoy such a prospect, and therefore M. de Bilinski thinks :

"A coalition may be formed to hold the Titan in check. There would be three partners in this combination : the Chinese, the Latin, and, of course, the German federations."

## TURKISH RULE EAST OF JORDAN.

Miss Gertrude Lowthian Bell contributes a very interesting article upon a very little-known subject. She has been traveling on the other side of Jordan, through which the great pilgrim road passes to Mecca, and which is important politically on account of its connection with the English occupation of Egypt. In this vast territory she finds that the moribund Ottoman Empire has experienced a renewal of vigorous existence, which is one of the by-products of the Russo-Turkish War :

"The axis of the Sultan's authority over the whole district is to be found in the rapid growth and unrivaled prosperity of the Circassian settlements. Flying from the Caucasus before the invading Russian, the Circ

## OTHER ARTICLES.

The Comte de Solissons contributes a criticism of Sienkiewicz; Prince Alfonso de Bourbon describes his efforts in Europe to abolish duelling; the Hon. L. H. Courtney, M.P., and the Hon. Alfred Lyttelton, M.P., discuss the South African situation; Mrs. Gertrude Atherton describes her researches in the West Indies which led to the disclosure of facts regarding the mother of Alexander Hamilton, some of which are set forth in Mrs. Atherton's book, "The Conqueror."

## GUNTON'S MAGAZINE.

THE leading editorial articles in *Gunton's* for August present "The Need of a Strong Opposition Party" and the anti-administration side of the Cuban reciprocity question.

Among the contributed articles Mr. Henry White's discussion of "Machinery and Labor" is deserving of special attention, giving as it does a temperate and well-considered statement of the part played by machinery in modern industrial life and the relations which it sustains to the general labor movement.

## WHERE ORGANIZED LABOR HAS PROFITED BY MACHINERY.

Mr. White directs our attention to one instance in which machinery was almost immediately recognized by the laborers themselves as a boon:

"The typographical union is a notable example of a union which has accepted a revolutionizing invention as being inevitable, and thus succeeded in securing a rate of wages for the operators considerably in excess of that received by the hand compositors. An officer of the New York union estimates that each linotype machine introduced into the newspaper offices displaced three men, and that within three years, owing to the increase in the size of the newspapers and the larger demand for printed matter which it encouraged, the men laid off have been reemployed, and that to-day the pay rolls even exceed the former figure. This machine has also had the effect of elevating the standards of the craft, owing to the higher skill and education required. The competition among the employers is such that profits are reduced to a minimum, the public therefore receiving the full benefit of the improvement."

## COTTON MANUFACTURING, NORTH AND SOUTH.

Mr. Henry G. Kittredge presents some of the results of the twelfth census regarding the progress of the cotton manufacturing industry in the Northern and Southern States within the decade, 1890-1900. In the North the principal change in the industry during the decade was in the direction of installing new and costly equipment for the manufacture of the finer grades of cotton, while the manufacture of the coarser fabrics has been largely relegated to the South. In the whole country there was an increase of nearly 5,000,000 spindles in the ten years. About 56 per cent. of this increase was in the South and 44 per cent. in the North. In the North, over 90 per cent. of the gain was in Massachusetts alone, while about 83 per cent. of the South's gain was in the States of North Carolina, South Carolina, and Georgia. The social conditions of factory employees in the cotton mills of the South have apparently improved since 1890, but the proportion of children among the wage earners was as great in 1900 as in 1890, or from 28 to 27 per cent., against 4 to 10 per cent. in New England.

## THE NINETEENTH CENTURY AND AFTER.

THE *Nineteenth Century* for August opens with a sonnet by Mr. Swinburne on the centenary of Alexandre Dumas. It reminds us more of the earlier Swinburne than most of his recent work. We quote four lines:

Man of men by right divine of boyhood everlasting,

France incarnate, France immortal in her deathless boy,  
Brighter birthday never shone than thine on earth, forecasting

Millions of money raised in discontent, and spent in disappointment and waste, might have found profitable application—even for educational purposes, though of another kind."

## THE FUTURE OF RUSSIA.

M. A. de Bilinski predicts that Russia is going to eat up all Europe, as well as Asia.

"The picture of the ultimate destiny of Russia must show her in the rôle of mistress of Asia and Europe, unified under the action of the Slav leaven. Russia is bound to attain extraordinary greatness, not only through the internal development of her existing empire, but through further expansion. Her dominion, in any case, representing that of the whole Slav race, will stretch from the Arctic and North seas to the Persian Gulf and the Mediterranean, and from the Pacific to the Adriatic and the Oder."

The other nations can hardly be expected to enjoy such a prospect, and therefore M. de Bilinski thinks:

"A coalition may be formed to hold the Titan in check. There would be three partners in this combination: the Chinese, the Latin, and, of course, the German federations."

## TURKISH RULE EAST OF JORDAN.

Miss Gertrude Lowthian Bell contributes a very interesting article upon a very little-known subject. She has been traveling on the other side of Jordan, through which the great pilgrim road passes to Mecca, and which is important politically on account of its connection with the English occupation of Egypt. In this vast territory she finds that the moribund Ottoman Empire has experienced a renewal of vigorous existence, which is one of the by-products of the Russo-Turkish War:

"The axis of the Sultan's authority over the whole district is to be found in the rapid growth and unrivaled prosperity of the Circassian settlements. Flying from the Caucasus before the invading Russian, the Circassians have found a new home in the Jordan valley, and are now beginning to exert a powerful influence on the Turkish administration."

sians have been settled in various parts of Turkey in Asia. Rapacious, cruel, industrious, and courageous, they are by nature a ruling race. They will turn the idle and ignorant Bedouin into servants, or drive them eastward into the desert, and they will rule them with a rod of iron, and hold them in check with a relentless persistency, against which they are powerless. They are a sharp sword in the hands of the Sultan, the defenders of Islam in the east of Jordan. Turn to the southern of the three imaginary divisions, and you shall find the Circassian supreme over the land; from the governor down to the common soldier, the ruling class is almost entirely drawn from them. They are a scourge and a terror to the inhabitants, yet it cannot be denied that, on the whole, they make for order. The Christian population suffers acutely at their hands."

#### A MOTOR WAY THROUGH ENGLAND.

Mr. B. H. Thwaite suggests "that a special cycle way should be constructed, as direct as possible, from London, through the center of England, as far as Carlisle, from which it could be continued to Glasgow or Edinburgh, if not to Inverness. The surface of the cycle or motor-car way to be formed by means of specially hard creosoted wood blocks with asphalt joints. Compared with a railway, the cost of permanent-way construction would be trifling. The questions of gradients, embankments, bridges, tunnels, curves, are comparatively trivial, because, although this motor-car or cycle way would probably be used for freight traffic, the light weight of such cars, compared to a locomotive and railway train, would permit a very light form of bridge construction to be used. The author has already calculated that a small annual fee of 2s. 6d. from all the members of the cycle unions and clubs in Great Britain would go a long way toward financially justifying the construction of such a cycle way."

#### HOW TO CONTROL WAR CORRESPONDENTS.

Mr. Perceval Landon suggests that future war correspondents of newspapers should be dealt with in a more scientific manner than they were in South Africa. His first suggestion toward the improvement of the existing situation is that:

"(1) Lists shall be kept at the War Office (A) of newspapers which shall be permitted to have representatives at the front, and (B) of those men (a) who have satisfied the office of their capacity and trustworthiness, and (b) of those who wish to be included in list (a), and will be so included after inquiry has been made as to their fitness."

The right to have a correspondent at the front would be withdrawn from "any newspaper which shall have published at home harmful letters or other information from the seat of war, whether such information be proved to have been sent by its official representative or not."

#### OTHER ARTICLES.

Mr. Cecil Hallett describes the last resting-place of England's Angevin kings at Fontevault, in the southern border of Anjou.

Mr. C. L. Eastlake writes a paper on "Modern Critics of Old Masters," from Reynolds and Ruskin downward.

Mr. W. T. Fletcher has a very interesting account of the evolution of the warship, under the title of "The *Esthetics of Naval Architecture*."

There is a pleasant gossiping paper by the late Dr.

George Fleming on the folklore of horses and horse-shoeing.

Mr. H. Hamilton Fyfe and Mr. W. F. Lord wrangle with each other on the subject of the censorship of plays, and the recent action of the censor in the case of "Monna Vanna."

#### THE CONTEMPORARY REVIEW.

MR. J. A. SPENDER writes, in the August *Contemporary*, on "The Liberal Party—Past and Future." He recognizes as a crowning mercy that the Liberal party has come through these bad years of the war without a definite split between imperialist and other groups. Whoever aspires to lead the Liberal party must aspire to lead the whole of it. It is proved that if war divides Liberals, it brings with it a number of issues which unite them. Those who said that the old Liberalism was dead had assumed that the old Toryism was dead. Manifestly that was untrue of legislation, and it will probably also be untrue of administration. As to Home Rule, he says if English Liberals treat the Irish frankly, and assume them to possess some degree of common sense, they will probably discover that the Irish are quite as much alive to the difficulties of the situation as the English are themselves. On the other hand, the Liberal leader who will let opponents secure the British vote on the allegation that the union is in danger, and the Irish vote on the ground that the Liberals had recanted Home Rule, would not be displaying a genius for political management.

#### THE ECONOMIC TAPROOT OF IMPERIALISM.

Mr. J. A. Hobson, in one of those thoughtful essays on economic questions which he occasionally contributes to the periodical press, discusses the economic cause of which imperialism is the outward and visible fruit. He says:

"It is idle to attack imperialism or militarism as political expedients or policies unless the axe is laid at the economic root of the tree, and the classes for whose interest imperialism works are shorn of the surplus revenues which seek this outlet. The struggle for markets, the greater eagerness of producers to sell than of consumers to buy, is the crowning proof of a false economy of distribution. Imperialism is the fruit of this false economy; social reform is its remedy. The primary purpose of social reform, using the term in its economic signification, is to raise the wholesome standard of private and public consumption for a nation so as to enable the nation to keep up to its highest standard of production. Trade unionism and socialism are thus the natural enemies of imperialism, for they take away from the 'imperialist' classes the surplus incomes which form the economic stimulus of imperialism. Everywhere the issue of quantitative *versus* qualitative growth comes up. This is the ultimate issue of empire."

#### SCIENCE AND IMMORTALITY.

Miss Emma Marie Caillard, discussing the question of immortality from the scientific standpoint, argues strenuously and well against "the false assumption that there is a scientific presumption against the persistence of individual life after death so strong that a greater weight of evidence should be demanded than would be necessary before it can be accepted as proved." She maintains that, apart from the evidence of apparitions and the like:

"From the scientific standpoint we can claim a presumption in favor of the persistence of human individual life after death, a presumption founded on the prominent place of individuality in Nature, and its presence in so high a degree in man that actual conditions are insufficient to give it scope. The body of a bird or of any animal does not strike us as limiting its individuality, rather as expressing it in a most complete and appropriate manner. The individuality of many a human being, on the contrary, seems to be fighting its way to expression through bodily hindrances, rather than clothing itself in a suitable and controllable form."

She also suggests that telepathy, which is known to exist between living beings, while still in the body, might enable communication to be established between the disembodied and those whose physical life still continues.

#### IN DISPRaise OF THE ROMANS.

Mr. A. M. Stevens, in an article entitled "Prevalent Illusions on Roman History," says some plain truths concerning the character of the Romans, which are calculated somewhat to disturb the glamour that is thrown over ancient Rome by the mist of history and of song. He says:

"The nobles were a parcel of crafty intriguers who made and administered the laws with a view solely to their own interest and aggrandizement. In the Roman senate every man had his price. The love of gold was the sordid spring of the most brilliant enterprises of the republic. In this verdict history is unanimous. The plebeians have very little more claim upon our consideration, for a more contemptible pack of rascals never sullied the pages of history. The body politic was clogged and hampered by a horde of frivolous and irresponsible citizens, hopelessly abandoned to ease and amusement."

Below the plebeians were myriads of slaves, who bodily and mentally were equal to their masters, but who had no human rights, and were tortured, murdered, and outraged at will. In war the Romans were past masters in methods of barbarism. Their constant study was what Gibbon calls "the art of destroying the human species."

"Their voracious appetites refused to be satisfied by war and conquest, for a political opponent was invariably regarded as an enemy and pursued with bloody and implacable ferocity."

#### THE FUTURE OF THEOLOGY.

Mr. Samuel McComb, in an article entitled "Do We Need Dogma?" writes very hopefully concerning the future of theology. He says:

"Historical criticism, too, which has done so much to purge theology of accidental accretions, has also contributed very materially to its substance and strength. Agnostic despair of history is no longer possible. Professor Harnack being witness, the fire of the most stringent criticism has failed to dissolve such facts as these: (1) That Jesus claimed to be the Messiah, the prophetically-announced deliverer of God's people; (2) that the Logos-doctrine of St. John cannot be traced back to Milo; (3) that the marvelous (if not the strictly miraculous) cannot be eliminated from the records without utterly destroying them. Men are asking today not: Is there a God; but, What kind of a God is he who is involved in all thought and life; what is the character of the Will behind the universe? Theology

answers: Look at Jesus as he lives and breathes in the Gospel history, and you will find God; his reason and heart lie at the center of all things; in him you will discover the clew to the winding mazes of history, the baffling perplexities of thought, the dire mysteries of Nature. No doubt we have here rather a faith and a conviction than a reasoned and a demonstrated conclusion. But truth can afford to wait."

#### OTHER ARTICLES.

Katherine Wylde writes an interesting literary paper upon Dmitri Merejkovski, whose book, "The Resurrection of the Gods," has just been published in an English translation entitled "The Forerunner." She says:

"His books are historical novels, brilliant and varied pictures of early Christian and Renaissance times. They are also a setting forth of, an apology for, modern ideas."

Dr. E. J. Dillon writes on the foreign affairs of the month, with special reference to recent events in Spain, on which he gives a good deal of information which is not accessible to readers of the English newspapers.

#### THE FORTNIGHTLY REVIEW.

IN the August *Fortnightly*, Mr. Michael Macdonagh gossips very pleasantly through twenty-two pages on prime ministers and their appointment. The article is brightly written, and full of interesting reading. It contains a good many "chestnuts," but as an *aide-mémoire* it is handy and useful. Mr. Macdonagh recalls, for instance, the earlier style of the *Times*. A hundred years ago it roundly denied that the constitution recognized any such office as a prime minister's. He quotes Mr. Low, in the "Dictionary of National Biography," as the authority for the statement that the selection of Lord Rosebery as Mr. Gladstone's successor in 1893 was the act of the Queen alone. Sir Robert Peel, in 1845, declared that he did not advise the Queen as to the choice of his successor. "I offered no opinion," he said. "This is the only act which is the personal act of the sovereign. It is for the sovereign to determine in whom her confidence shall be placed." During Mr. Gladstone's premiership he created sixty-seven new peerages, called fourteen Scotch and Irish lords to the House of Lords, made seven promotions in the peerage, and created ninety-seven baronets.

#### THE FORESIGHT OF THE FUTURE.

Mr. Maeterlinck has an extremely interesting paper, in which he describes an investigation which he has recently made in Paris to see whether the astrologers, palmists, and all the soothsayers and diviners of the present time could foresee the future. He went to see all the most famous of the prophetesses, who, under the names of clairvoyants, seers, mediums, and all the rest, are the direct heiresses of the Pythonesses of old. He found much knavery, simulation, and gross lying, but he also found certain incontestable phenomena which convinced him that these psychics can see further than ourselves into our hearts, and are able often to make predictions which are at times astonishingly fulfilled. At the same time he found nothing conclusive, nothing decisive in his investigations, although he thinks it is almost incredible that we should not know the future. What success the psychic achieved he attributes entirely to the capacity to intrude into our own inner consciousness, to which our physical

consciousness can but seldom appear. Time to him is a mystery, arbitrarily divided into a past and future. "In itself it is almost certain that it is but an immense, eternal, motionless Present, in which all that takes place, and all that will take place, takes place immutably; in which To-morrow, save in the ephemeral mind of man, is indistinguishable from Yesterday or To-day." Man is separated from the future by the great infirmity of his mind, but nothing but the displacement of a cerebral lobe would be enough to make the future unfold itself before us with the same clearness as the past. "It is only by glimmers, by casual and passing infiltrations, that future years, of which he is full, of which the imperious realities surround him on every hand, penetrate to his brain."

#### ALSACE-LORRAINE AND WILLIAM II.

Dr. Karl Blind, writing upon the abolition of the dictatorship in Alsace-Lorraine, speaks cheerfully concerning the way in which the Alsatians are reconciling themselves to their German conquerors. Karl Blind, however, it must be admitted, is a somewhat prejudiced witness, as he admits he was one of the first to declare in favor of annexation. Blood and speech, he declares, assert themselves with ever-increasing strength, as the rising generation becomes better acquainted with the past of its race. The military system of Germany tends to Germanize the population, and a more popular system of government at Berlin would quicken the change with rapid pace.

#### THE RED CROSS DURING THE BOER WAR.

Mrs. Lecky writes an article entitled "Inter Arma Caritas," which describes the growth of the Red Cross societies, and at the close states some of the facts as to the way in which the British military authorities used their power to deprive the Boers of the rights and privileges supposed to be secured to them by the Geneva Convention. Among the many disgraceful chapters of the story one of the worst is that which describes how the British Government, under first one pretext and then another, either stole the ambulances which had been presented by the Red Cross societies to the Boers, or prevented the dispatch of ambulances for the relief of the wounded. Mrs. Lecky, being the wife of a Unionist member of Parliament, is very sparing in her adjectives; but she tells enough of the shameful story to enable those who read between the lines to understand that the British Government, in the adoption of the various methods of barbarism employed for the crushing of the Boer resistance, did not hesitate to trample under foot the provisions of the Red Cross Convention. There may be no article in the Convention of Geneva to appeal to, but, asks Mrs. Lecky, is it in accordance with its spirit that in a prolonged war one of the belligerents should be deprived of the beneficent aid of the Red Cross? It is to be hoped that at the congress which is to be held at Geneva this autumn the convention may be amended in such a way as to deprive any future government of the excuse of following the evil precedent of the British military authorities.

#### THE NEW FLYING SQUADRONS OF FRANCE.

Mr. Archibald S. Hurd calls attention to the latest development in French naval policy, which has been carried out by M. Lanessan. In each ocean the French Minister of Marine is placing a fleet which exceeds in power either of the squadrons maintained by Great Britain. Wherever either of the two French squadrons,

in the Atlantic or the Pacific, may appear during their periodical cruises, it is the French fleet and not a local and isolated British squadron which will be the supreme force.

#### OTHER ARTICLES.

Mr. Walter Sichel writes on "Some Phases in Fiction," and Mr. George Gissing supplies the second part of the "An Author at Grass," extracts from the unpublished papers of Henry Ryecroft.

#### THE NATIONAL REVIEW.

THE *National Review* for August has some good literary articles, notably Sir Leslie Stephen's paper on "Young's Night Thoughts" and Sir Rowland Blennerhassett's essay on Guizot.

Sir Horace Rumbold continues his recollections of a diplomatist; a writer signing himself "Telescope" expresses considerable doubt as to whether the use of the search-light in naval warfare is not calculated to assist the assailing torpedo-boat rather than the man-of-war, whose chief weapon of defence is her invisibility. In the attack of the Taku forts the Russians, who used the search-light, were struck many times, while the German and the British ships which bore the brunt escaped almost untouched.

#### A CHINESE PLAY.

Mrs. Alfred Lyttelton contributes a graceful little Chinese play in one act, entitled "A Tale of Two Feet." The *motif* is very simple. A Chinese girl, whose feet have not been crippled, is in love with a mandarin who, being a member of the Imperial house, is not permitted to marry any one whose feet have been compressed. The girl, not knowing this, feels certain that the moment he sees her large feet he will leave her, and therefore does her best to conceal them behind her petticoat. On the other hand, the mandarin mournfully admits that he can never marry her for exactly the opposite reason. They are just about to part forever when her foot peeps out for a moment in a dance. She is in despair, when her sorrow is turned into delight by being told that but for what she regarded as her shame the longed-for marriage could never have taken place.

#### THE BRITISH SEAMAN.

The Marquis of Graham, writing on "British Sailors and the Mercantile Marine," maintains that from the statistics of the port of Glasgow the British seaman, man for man, is more sober and more amenable to discipline than the foreign seaman who is largely supplanting him. He also asserts—what is not generally believed—that there is no truth in the assertion that foreigners are cheaper to employ than men British born. The gradual dwindling of the British seaman is due to the disuse of the apprenticeship system. He suggests that a sound system compelling shipowners to carry apprentices should be established, in return for which subsidies should be paid to vessels capable of serving as auxiliary ships of war in case hostilities should break out.

#### THE WESTMINSTER REVIEW.

THE *Westminster Review* for August is a very interesting number, containing several thoughtful and suggestive articles. It opens with a paper on "Peace in South Africa," the gist of which is summed up in the sentence that "on paper we are the victors,

in fact we are the vanquished." It praises Lord Kitchener, who won his victory by his tact and by his imagination, and saved Great Britain from the curse of another Ireland in South Africa.

Mr. R. J. Sturdee examines the "Teaching of History of War," and maintains that the secret of England's greatness is that throughout her history she, of all the great nations, has been least at war. She worked out her own salvation by concentrating her attention more upon internal than upon external affairs.

There is a somewhat elaborate article entitled "The Imperfection of Protectionists' Arguments," which takes the form of a reply to Sir Vincent Caillard's papers in the *National Review*. The primary object of the writer is to demonstrate the inadmissibility of the bulk of statistical evidence used in discussing the merits or demerits of free trade or protection. The fiscal scheme advocated by Sir Vincent Caillard is absolutely illusory, and crumbles away under the test of analytical criticism as being self-destructive and self-contradictory.

Mr. N. C. Macnamara discusses "The Chemical Theory of Life." Mr. A. P. Sen writes an article repelling the theory that English education creates sedition in India. Mr. F. W. Muller writes on "The Essential Falsehood of Christian Science." Christian science is to him the apotheosis of nonsense. Mr. A. W. Wilcox, writing on "Insanity and Marriage," applauds the action of Florida and one or two other American States in making insanity a justification for divorce. He would also allow divorce in case of confirmed drunkenness.

Mr. J. A. Gibson writes a very pleasant paper on the delights of becoming possessed of a library in middle age after having been kept from spoiling the flavor of the best books by youthful and unappreciative reading.

#### THE MONTHLY REVIEW.

THE *Monthly Review* for August contains an elaborately illustrated paper upon Khartoum and its antiquities, by Mr. John Ward. A still more plentifully illustrated paper is devoted to the painters of Japan. It is the second part of Mr. Arthur Morrison's account of Japanese art and artists. The Hon. R. H. Brand replies to Mr. Kershaw's paper on the promotion of trade within the empire. He writes from the standpoint of an uncompromising free trader.

Mr. R. E. C. Long, in a paper on "Russia's Latest Venture in Central Asia," suggests the advisability of making a railway through Afghanistan for the purpose of connecting Russian Central Asian lines with the Indian railway system. He describes what has been done in the construction of the Orenburg-Tashkent line, which will tap the whole fertile valley of the Oxus, and provide direct intercommunication between Central Asia and Siberia. When the new line is completed Russian grain will be sent direct into Khanates, while the journey for Siberian products will be reduced by one-half, the goods being sent along the main line to Somali, and thence direct by Orenburg to Central Asia. The article would have been improved by a map.

Mr. Benjamin Taylor discusses the proposed junction of the Atlantic and Pacific by a canal across the Isthmus in an article entitled "The Wedding of the Oceans." The construction of such a canal would reduce distances in favor of the United States, but the change would in many instances produce a complete reversal of the advantage which British trade at present enjoys.

Algernon Cecil writes upon Lord Beaconsfield, and Lieut.-Col. Carlyon Bellairs has a second paper upon "The Navy and the Engineer." Mr. Henry Newbolt writes a poem, describing how, when "Terror's footfall in the darkness crushed the rose imperial of our delight,"

I saw the King of England, hale and fair,  
Ride out with a great train through London Town.

#### THE EDINBURGH REVIEW.

THE most remarkable thing about the *Edinburgh Review* for July is that that number completes its hundredth year of publication. It is announced that the October issue will contain an article dealing with the whole history of the *Review*, together with some portraits.

The opening article of the present number deals with "The Decline and Fall of the Second French Empire," the results of the Mexican expedition being described in detail. An article on "War and Poetry" deals with English battle-poetry. The reviewer remarks upon the extraordinary absence of good poetry dealing with the recent war. The only poem produced by the war which is likely to live is, he says, one written by Mr. Henry Newbolt. But it is rather hard on poor Mr. Alfred Austin to contrast him with Lord Byron. The reviewer explains the absence of good poetry on the Boer war, partly by the fact that modern poets have always written better war-poetry when they were divided from their subject by time.

#### A CORNER OF THE TURKISH QUESTION.

There is a paper on the Albanian question, in which the reviewer revives an old suggestion for the formation of a joint Albano-Grecian state on the model of Sweden and Norway.

"The two states together, it is urged, could easily check the progress of the Slavs and keep them out of Macedonia, as in olden times Philip of Macedon, assisted by the Illyrians—the ancestors of the modern Albanians—succeeded in repelling the barbarians of the north. Greece would gain much from such an alliance. The Albanians are warriors born and bred. Their existence for centuries past has been a continuous fight—now against the Turks, now against the Slavs. When in want of foreign foes they keep themselves in training by their internal feuds. To Greece such allies would be invaluable. In return for this service the Albanians would profit by the Greek aptitude for a seafaring life. Their coast will be defended by the Greek fleet, and Greek enterprise would also develop the commercial possibilities of the country. Moreover, the civilization of the Greeks would enable Albania to lay the foundations of a national education and of a political organization. The idea, so far as it has been promulgated, seems to have met with a favorable reception among the 'brethren.' There is a strong racial affinity between the Greeks and the Albanians."

Even under present conditions the Greeks and Albanians readily assimilate, and a fifth of the population of the present kingdom of Greece is made up of Albanians. The Albanian is mentally not inferior to some of the best races of the West. He shows a marvelous susceptibility to civilization, and out of his own country easily adapts himself to the modes of more highly-cultured peoples.

## OTHER ARTICLES.

There is a review of Mr. Colquhoun's book "The Mastery of the Pacific," a paper on the education bill, and another on Victor Hugo, in which the reviewer says that Hugo's great defect as a writer is that he cannot get rid of himself; in his dramas and his novels he cannot utterly lose himself in his creations.

## THE QUARTERLY REVIEW.

THE chief feature in the *Quarterly Review* for July is Mr. Swinburne's appreciation of Charles Dickens, which is quoted at some length elsewhere. The number opens with a review of the books describing the tour of the Prince and Princess of Wales round the empire.

The writer of the article "The Romance of India" reviews Kipling's "Kim," Mrs. Steele's stories, etc., but the only point in the article that is worth quoting is the concluding passage, in which he hazards the speculation that some day it may be said that the translation of the sacred books of the East in the nineteenth century marked the beginning of a new intellectual era, as the translation of the Greek writers did in the fifteenth century. Who can tell that in some mud cottage in a hamlet on the plains or a shepherd's cottage in the hills there may not at this moment be lying a babe from whose mouth some day will proceed that which millions will for ages accept as part of their guidance in the difficult journey of life?

There is an article on James Russell Lowell. The writer, probably from temperament or from religious prejudice, is unable to do justice to the most important part of Lowell's writings. But he is not without appreciation of his descriptive work. Otherwise he would not have written:

"What Lowell more or less did in all his activities was to extricate the finer creed of his forefathers from its coarser and more obsolete surroundings, and to ap-

ply the sturdy sagacity and strong moral sense, the shrewd humor, and deep, if limited, feeling of the old Puritan to the problems of his day. These qualities, he held, would enable them to guide the inevitable democratic tendencies into the paths of downright honesty and sound common sense, and encounter the danger of political and social materialism that threatens the faith in plain living and high thinking."

There is a very interesting article concerning the depth of the sea, which deals with the inhabitants of the ocean depths which lie deeper than three hundred fathoms. It is an interesting subject, and it is handled in an interesting fashion. The fishes which inhabit those great depths are the only living creatures that inhabit a changeless world. Climate plays no part in their lives, seasons are unknown to them, and they experience no change of temperature. The ocean depths produce no vegetation, and yield no food save that which descends to them from above. In that cold, still, and noiseless world monotony reigns supreme. Some of the fish go blind, others develop huge eyes, while a third class carry their own lamps with them. Many of them have enormous jaws, and some are able to swallow fishes much larger than themselves. Altogether the article makes one thankful that we were not born in "the dark, the utter dark, where the blind white sea-snakes are."

There are several literary articles of more than usual note. In one the reviewer endeavors to revive the reputation of a forgotten poet, George Darley, who published his works between 1822 and 1841. Another literary article of great length and importance is an attempt to give a critical estimate of the value of the work of the Italian poets of to-day.

There is an article entitled "The Efficiency of the Services," which declares that it is impossible for England to rest content with a system which produces an uneducated army, an ill-prepared navy, and an inadequately informed foreign office.

## THE CONTINENTAL REVIEWS.

## REVUE DE PARIS.

OF the six historical articles in the *Revue de Paris* for July, the student will turn with most interest to the account of Rostopchine, the heroic Russian who is believed to have set fire to the town of Moscow rather than to let it fall into the hands of Napoleon and his legions.

The Napoleonic epoch provides the matter for three other articles. The first describes the elaborate arrangements, made in view of the elections of 1818, when the imprisoned Emperor was still adored in France, and when Louis XVIII. and his government ran every risk of seeing it proved to the world how little had been desired by the country the Restoration forced upon it. The second, entitled "Napoleon and the Popular Drama," shows how very important the great conqueror considered the amusement of the people. He always found time, even when actually engaged in a campaign, to concern himself with these kinds of matters; and by his special wish plays dealing with heroic episodes, of a nature to evoke the enthusiasm and patriotism of the spectators, soon took the place of the comedies of intrigue which had delighted the Parisians of the eighteenth century.

The letters of Mme. de Remusat, written between 1815 and 1817, though not directly concerned with Napoleon, give, of course, many amusing side-lights on the

Napoleonic era, especially of the kind of simple incidents laid in the provinces, and of the way in which the great events then shaking Europe were regarded by French provincials.

The centenary of Dumas Père has inspired M. Parigot to write a curious paper concerning Dumas' value as an historian. His latest critic claims that even if he concerned himself very little with historic accuracy, Dumas could certainly claim to have had an extraordinary degree of intuitive perception of ages other than his own. He possessed to a remarkable degree the power of reconstituting the mental atmosphere of an epoch. His heroes and heroines were intensely living creations—and this, whether they had had actual prototypes, or whether they were in very truth the children of his imagination.

## NOUVELLE REVUE.

WE have noticed elsewhere M. Desmarest's curious and instructive article on "Inventors: Their Good and Evil Fortune." Of the political articles the first deals with "The Situation of Italy, especially in relation to Tripoli."

The French have always taken the keenest interest in the financial side of their colonial possessions. M. Paris contributes a short, but none the less valuable paper,

concerning what he styles "The Piastre Question in Indo-China." Indo-China has to deal with much the same problem as have the English administrators in India, and what the rupee has so long been to the Anglo-Indian, the piastre is to those officials whose fate it is to be closely connected with Indo-China.

Yet a third article dealing with "France's Colonial Empire" attempts to give a forecast of the economical future of Martinique. The writer, M. Dassier, denies that there is the slightest necessity for evacuating the island. Martinique is now in a very peculiar position. Any and every experiment may be tried, and M. Dassier evidently believes that French capitalists might do worse than turn their attention to this most fertile spot, especially with a view to financing coffee estates. The island has always been famous for the excellence of its coffee and of its cocoa. There, as elsewhere in the West Indies, the abolition of slavery put an end to the splendid prosperity of the island. There now seems to be an idea of importing Chinese labor, and it must be admitted that the Chinaman, alone of human beings, seems dowered with a practical fatalism which makes him strangely indifferent to what the future may bring him.

Two articles are devoted to Siam. The one by M. Savine describes at great length the character and nature of the Crown Prince of Siam, who is now visiting Europe; while the other is ominously entitled "Siam: the Coming Conflict."

Other articles deal with the Piedmont insurrection of 1790, a scientific mission undertaken by Dumas Père, "The French Theatrical Financial Crisis," and an amusing biographical sketch of the great Napoleon's somewhat foolish brother, Lucien.

#### LA REVUE.

M. CHÉRET writes with warm admiration in *La Revue* for July of the widely read and most influential Polish novelist and journalist, Alexandre Glowacki. Here, at any rate, is a modern writer, after reading whom we do not feel as if we "had been eating soap." Glowacki is far better known as "Bolesaw Prus." It is enough, says M. Chéret, to say these two words to a Pole for a broad smile to light up his face. He smiles first because he is devoted to Glowacki, and secondly because he remembers the genial Dickensian humor of his many and widely read works—some fifteen or sixteen volumes. Glowacki's message to his countrymen is that this their light affliction endures only for a moment; it is but such as all great peoples must endure. It will not permanently affect their destinies. As for the eventual independence of Poland, Glowacki seems to consider it too obvious to be discussed. Besides writing tales and novels, he is a journalist of great distinction; and contributes to one of the most widely circulated Polish papers a brilliantly clever weekly *chronique*. In his understanding of human nature and delicacy of humor, M. Chéret would place Glowacki before Dickens. Unlike Gorky and Tchekhoff, he seeks for goodness and kindness in life. Following this article is a translation of one of his stories, "The Spy."

#### THE PROGRESS OF SPELLING REFORM IN FRANCE.

M. Renard, writing on spelling reform, says that delegates from the Higher Board of Education in France

and the French Academy are shortly to examine a project of spelling reform, supported by several well-known men of letters and grammarians. The chief points to be discussed are: (1) Frenchifying foreign words in common use; (2) unifying spelling; (3) simplifying double consonants, ph, th, etc.; (4) getting rid of double consonants.

#### THE DUTCH MAGAZINES.

THE most interesting article of the usual three contained in the current issue of *Vragen des Tijds* is that on "Insurance Against Being Out of Work," with special reference to what is being done in Ghent. This new form of insurance arose out of an exceptional crisis; and an attempt of this kind was made in Rotterdam some years ago, but was not successful, owing to difficulties and differences of opinion in the way of helping the unemployed. In certain towns in Switzerland an arrangement of this nature is in force; but in Ghent the idea has been carried out in a manner that appears to be satisfactory, and there is very little fear that the subsidy given to workmen's unions will lead to the demoralization of those assisted. The writer enters into details, and the complete article is worth reading by labor leaders and others interested in the question of the unemployed. The other articles are a learned dissertation on "Penal Law and Criminal Anthropology," and some remarks on "Letters of Mutilati and Huet."

*De Gids* opens with a novel by Augusta de Wit, "The Goddess Who Watches," to give a literal translation of the title. It is good reading. This is followed by an article on Mr. Hall as a minister, which will be chiefly interesting to those only who are associated with, or follow intimately, the political circumstances of Holland. The next article, according to a footnote, is rendered less interesting by the conclusion of peace in South Africa; it discusses the "Boer Movement" in America, and gives reasons why Americans should be and are in favor of the Boers. "In no other country," says the writer, "is the will of the people more powerful;" and the will of the people in this instance, in his opinion, is in favor of freedom. The President and the Secretary of State are friends of the Boers because they are lovers of freedom. Dr. Singel's observations on old-time traveling are pleasant and amusing reading, but there is not a great deal that is new to be said on the subject. Dr. Nieuwenhuis tells us of the increase of Dutch influence in Borneo; he describes the progress made with the tribes extending to Sarawak and elsewhere, and shows that the influence of Holland is certainly extending.

In *Elsevier* we turn at once to the article on Japanese printing, with its reproductions of pictures to be found on Japanese decorative papers and the like. A separate portrait of Professor Rosenstein, and a glowing sketch of the celebrated scholar, together with the customary character sketch of an artist of note, a short story, and other features make up an average number.

*Woord en Beeld* contains an illustrated description of the exhibition of ancient art,—pictures, clocks, plate, etc.,—at Deventer; a portrait and sketch of the career of J. C. van Marken, well known in industrial circles; a story, music, and pictures.

- Copper, Bessemerizing of, J. Douglas, *CasM*, July.

## *Review of Reviews.*

VOL. XXVI.

NEW YORK, OCTOBER, 1902.

No. 4.

### THE PROGRESS OF THE WORLD.

*Speaker  
Henderson's  
Retirement.* It was natural enough, as the month of October was approaching, with the Congressional and State elections only a few weeks ahead, that the newspapers and the politicians should succeed in partly arousing the country from the extreme apathy about matters of party politics that had prevailed through the summer. No previous event of the season had done so much to stir up political interest as the suddenly announced decision of Speaker Henderson,—who had, as usual, been renominated for Congress,—to refuse the nomination and retire from the contest. Mr. Henderson's explanations, made on September 16, do not show him at variance with the views of President Roosevelt on any question whatsoever to which he makes allusion, nor does he express himself in a manner inconsistent enough with the Iowa platform of this year to warrant any embarrassment on the score of that platform's avowals on the subject of the tariff as related to trusts. But Mr. Henderson makes it quite plain that he had found his views opposed by a considerable body of Republicans in his own district, which is the Third of Iowa, and is commonly known as the Dubuque district, from its chief city, which is also the home of Senator Allison. Mr. Henderson declares that there are in his district a great many "Republican voters who believe that free trade, in whole or in part, will remedy the trust evil." "I believe," he continues, "that it will not, but that such a remedy is likely to involve the nation in dangerous results, and, so believing, I feel that I should not accept the nomination for Congress, which was so generously tendered me, and I have decided accordingly." And he evidently meant what he said.

*A Great Office  
Involved.* The Speaker is, by virtue of his powerful office, the foremost figure in the House of Representatives, and so great is his authority that his views bear a vital relation to national policies as expressed in legislative programmes. The office of Speaker

has for the past quarter-century come to be spoken of quite commonly, by both practical and theoretical exponents of our system of government, as second in real power only to the Presidency. It had been commonly supposed that Mr. Henderson would have no difficulty in carrying his district in November, and that, in case of continued Republican control of the House, he would be made Speaker of the Fifty-eighth Congress, as of the Fifty-sixth and the Fifty-seventh. The retirement of Speaker Henderson, therefore, was naturally dwelt upon by the press as an incident of striking significance. As Speaker, with power to make up the committees, Mr. Henderson would have been in position to exercise more influence than any other man in the United States upon the action of Congress in matters affecting industry, trade, and the public revenues. With the convictions which he entertains so strongly,—and which do not seem to be different from those of the great majority of influential Republicans holding office,—it was hard for the country to understand why he should have declined a renomination which had already been tendered him by unanimous consent. But the case probably involved personal and local aspects that could not be wholly appreciated at a distance from Mr. Henderson's home.

*Personal  
Phases of the  
Matter.* There had been nominated by the Democrats to oppose him no less a figure than ex-Gov. Horace Boies, who is a sturdy campaigner, and who believes that the tariff is the "mother of trusts" quite as deeply as Speaker Henderson believes the contrary. The Democrats were preparing to make every possible effort in the district, and they were naturally making as much capital as they could out of alleged Republican differences on the question of tariff revision. The results of the contest in that district will be awaited by the country with peculiar interest. Mr. Henderson, who is sixty-two years of age, came to this coun-

Copyright by J. E. Bilbrough.

HON. DAVID B. HENDERSON, SPEAKER OF THE HOUSE OF REPRESENTATIVES.

try from Scotland fifty-six years ago, and he has lived in Iowa fifty-three years. He entered the army in 1861, at the age of twenty-one, as lieutenant in the Twelfth Iowa Regiment, losing his leg in battle in 1863, but reëntering the service as colonel of the Forty-sixth Iowa Regiment in 1864. With the expiration of the present Congress next March, he will have served twenty years consecutively in the House of Representatives. He is a lawyer by profession, and is the head of the Dubuque firm of Henderson, Hurd, Lenehan & Kiesel.

*Candidates  
for the  
Speakership.*

His withdrawal deprives Iowa of the honor of the Speakership, which, in case of the election in November of a Republican majority, would be quite as likely to go to Mr. Cannon, of Illinois, as to anybody else. Mr. Cannon has served in the House for

about thirty years, and is at present chairman of the Committee on Appropriations. Another prominent Congressional figure from Illinois, the Hon. Albert J. Hopkins, is quite likely to be removed from competition for the Speakership by securing the seat in the Senate to which so many Illinois Republicans have had more or less open aspirations. This is the seat which is soon to be made vacant by the completion of the first term of the Hon. William E. Mason. The recent State Republican convention recommended Mr. Hopkins as the choice of the party, for the enlightenment of the Republican members of the next Legislature. Mr. Mason does not admit the right of the Republican State convention to dictate in this matter; but other candidates, including the ex-Comptroller of the Currency, Mr. Charles G. Dawes, promptly accepted the convention's action, and it is at least probable that

Mr. Hopkins will become Senator Cullom's colleague. Among probable Speakership candidates, besides Mr. Cannon, there were mentioned last month Mr. Sherman of New York, Mr. Dalzell of Pennsylvania, Mr. Tawney of Minnesota, and Mr. Littlefield of Maine.

*Does the  
Tariff Foster  
Trusts?*

To return again to the public questions rendered the more conspicuous by Mr. Henderson's action, the honest voter may well find himself somewhat puzzled. Mr. Henderson declares himself an advocate now, as for several years past, of the idea of subjecting the so-called trusts to federal control as the best means to diminish or remove such evils as may be due to their methods. But he does not in the least believe that to open our doors to foreign competitors would afford us any relief

HON. JOSEPH G. CANNON, OF ILLINOIS.

(Who is likely to succeed Mr. Henderson as Speaker.)

from our own trusts, while it might, on the other hand, derange our industries and throw labor out of employment. He declares himself thoroughly in favor of reciprocity with Cuba, and of a wider application of the reciprocity principle. Mr. Henderson squarely accepts the principle of the Iowa platform, that the tariff should not be permitted to give shelter to monopolies that take advantage of the American people. But he holds that the Democratic plan would be to strike down American industrial combinations for the sake of allowing foreign combinations to come in and take possession of our market. The "Democratic Campaign Book" of the present year appeared early in September, and devotes a large

HON. ALBERT J. HOPKINS, OF ILLINOIS.

(Choice of State convention for U. S. Senator.)

part of its space to the section entitled "Tariff and Trusts," with a view to showing that the American people are greatly disadvantaged by the high prices which the trusts render prevalent under the Dingley tariff schedules. It presents a voluminous array of figures to prove its contentions. Gradually the issue seems to be shaping itself in the form of this question: Does the present tariff lend itself largely to the fostering of oppressive trusts and monopolies, and ought it to be promptly revised for that reason?

*Where  
Democrats  
Can Agree.*

To the question stated in this way both wings of the Democratic party would answer in the affirmative with substantial unanimity. The Democratic element that is best represented by Mr. Cleveland has been inclined to emphasize the evils of the protective tariff rather than the evils of the trusts; while the element of which Mr. Bryan is the leader has been disposed to be more aggressive in its attacks upon the trusts than upon the tariff. But both could readily enough come together upon a platform of tariff revision in the interest of the American consumer, as against large corporations supposed to be reaping undue advantage from the Republican system of high protection. The Republicans, on the other hand, differ somewhat, but not vitally, among themselves.

EX-GOV. HORACE BOIES, OF IOWA.

(Democratic candidate for Congress in Speaker Henderson's district.)

*Varying  
Republican  
Views.*

They all give great prominence to the fact that the country is busy and prosperous, and that the average business man would prefer to have political parties leave the present situation alone rather than bring about a period of distrust and uncertainty through agitation of tariff changes. All elements of the Republican party acknowledge privately if not publicly that the business conditions of the country have so changed as to render the Dingley tariff obsolete in many respects, and they all admit that it must some day be a good deal modified. Moreover, they all insist that the principle of protection must still be adhered to, and that the desirable sort of tariff revision would involve readjustment of schedules, but not a reversal of policy. Where the Republicans differ among themselves is as to the intensity of their feeling against trusts, and as to their views concerning the extent to which the tariff is responsible for combinations in restraint of trade and for unduly high domestic prices. They differ further among themselves as to the time when tariff revision should be undertaken. Most of them seem to be agreed that it would not be feasible for the present Congress to take up the question in the

short session this coming winter. Not a few of them wish that the present state of public opinion had been anticipated, and that Congress had last winter undertaken to revise at least a few of the Dingley schedules. There are others who take an opportunist view of the question, and believe in the plan of waiting to see what expression the people will make in the Congressional districts next month.

*The  
Practical  
Standpoint.*

Meanwhile, there are many people, who have no political fortunes at stake, who perceive clearly that the subject is not one especially adapted to stump oratory or party controversy, and that what is wanted is treatment of a concrete sort by business men, and by industrial and economic experts. Undoubtedly, some of the great corporations, loosely called trusts, are affected very closely by tariff conditions; others are affected scarcely at all. In every case the facts should be considered dispassionately. Thus, it does not happen to be true that the United States Steel Corporation has taken advantage of the tariff to exact the highest possible prices, for it is well known that it has been the policy of this so-called "steel trust" to keep prices down to a moderate figure, in order to promote a healthy and constant state of the market for its wares. But the steel trust is a great aggregation, and some of its industries are related to the tariff question in a way very different from others. Thus, if steel rails were put on the free list, it might make very little difference to the steel trust, whereas if the tin-plate tariff were repealed, a comparatively new American industry might be very seriously injured without any compensating benefit in the long run to the American consumer. These concrete cases, and hundreds of others analogous to them, ought not to be met any longer by Republican arguments or Democratic arguments. If we could only get rid of exaggerated and uncandid party attitudes in these matters that affect industry and commerce, it ought not to prove very difficult to readjust one tariff schedule after another on a strictly business basis in the light of all the facts involved.

*A  
Conference  
at Oyster Bay.*

Before the discussion of these questions received their fresh impetus from the circumstances under which Speaker Henderson withdrew from the Congressional campaign, President Roosevelt, who was about to start on his Western tour, had prepared a speech to be delivered at Cincinnati on September 20, in the course of which he took the ground that while trusts ought to be regulated, and ought to come under the control of the Gov-

ernment at Washington, it was not true that those against which there had been the most popular clamor were in any direct way the result of conditions that could be attributed to high-tariff schedules. Two or three days before starting upon this memorable round of speaking, handshaking, and visiting in the Middle West, President Roosevelt had taken counsel at Oyster Bay with several of the most influential Republican Senators. Thus, by his invitation, there had visited him, on September 16, Senator Allison of Iowa, Senator Aldrich of Rhode Island, Senator Hanna of Ohio, Senator Lodge of Massachusetts, and Senator Spooner of Wisconsin. This conference at Oyster Bay was regarded by the press and the country with exceptional interest. Unquestionably, the President recognized the fact that these gentlemen, taken as a group, were peculiarly representative of official Republicanism. Inasmuch as he proposed to speak on important questions of public policy while absent on his tour of more than two weeks, it was well that he should have exchanged views with these Senators, in the face of whose opposition certainly no important measure could be carried through the United States Senate. It was reported, as a result of the conference, that the President's views were unanimously supported as to matters of moment.

This means that the Senate leaders *Policies Agreed Upon.* accept the President's general proposition that great trusts and corporations should be brought under federal oversight, not with a view to the breaking down of modern business methods, but with the object at first of greater publicity, and subsequently of some legislation to deal with admitted abuses. Further, it was understood as a result of the conference that the President agreed with the Senators to the effect that no revision of the tariff could fairly be taken up until the Fifty-eighth Congress, to be elected this fall, has been organized for business, and that probably not much could be feasibly undertaken until after the Presidential election of 1904. The rapid development of public opinion may, however, cause both President and Senatorial group to take a different view of the urgency of tariff revision. A matter of especial importance said to have been discussed

by the President and his Senatorial visitors was that of Cuban reciprocity in particular, and the reciprocity question in general.

*Cuba as a  
Foremost  
Issue.*

It will be remembered that, in spite of strenuous opposition on the part of so-called "beet-sugar insurgents," the House of Representatives did finally pass a bill last session making a 20 per cent. tariff concession to Cuba; but the Senate did not concur. In our opinion, the foremost public question with which the voters should concern themselves in the pending campaign, and with which Congress should deal promptly on its reassembling in December, is that of our commercial relations with Cuba. It is hard to see how any right-minded man can fail to recognize the deep moral obligations under which we are placed in consequence of our expulsion of the Spaniards, assumption of control for a period of three years, and establishment of the Cuban republic under conditions whereby we reserve various advantages for ourselves. The voters should see to it that no man of either party is sent back to Congress this fall who will not give satisfactory assurances on this question. Nobody any longer pretends to assert before an intelligent audience that the beet-sugar crop of the United States will be affected a single penny one way or the other by the adoption of a scheme of reciprocity with Cuba.

*Annexation  
as the  
Alternative.*

The inevitable alternative is between reciprocity and annexation. Some at least of the Congressmen who have been opposed to Cuban reciprocity were the

ALL THAT'S LEFT HIM.—From the *Herald* (Boston).

THE RT. HON. SIR ROBERT BOND, PREMIER OF NEWFOUNDLAND.

(Who visited Washington last month to talk about reciprocity.)

victims of a scheme to bankrupt Cuban agriculture in the interest of those ready to buy up the sugar plantations at a fraction of their value. With agriculture and industry prostrated in Cuba, it is obvious that it would be practically impossible to raise a sufficient revenue to carry on the new republic successfully. Thus annexation would be precipitated, with the sequel of complete freedom of trade and an enormous boom in Cuban sugar lands, and with the American sugar trust in possession as the chief visible beneficiary. It would be far better to make good Mr. McKinley's promise to the Cubans, and to give their products favorable access to the American market in return for the splendid and varied market which a prosperous Cuba could give to the agricultural and industrial products of the United States. The reciprocity arrangement with Cuba ought to be a very liberal one on both sides, and eventually it ought to take the form of commercial union,—that is to say, free trade,—

followed, probably, at some indefinite future time, by political annexation. This is a subject that lies near to President Roosevelt's heart, and that is of much more immediate concern as an issue of practical statesmanship than the regulation of trusts or the revision of the tariff.

*Reciprocity  
in General.*

Reciprocity, indeed, as advocated by Mr. McKinley in his last speech, might well be adopted by the Republican party as an immediate policy in lieu of a revision of the Dingley tariff. Some of the men in Congress who have opposed the ratification of reciprocity treaties have done it purely upon the ground that reciprocity was an insidious step toward the modification of the rigid high-tariff system. But these men ought to be able to see that modifications of the tariff system on lines laid down by Mr. McKinley, the great tariff champion, might be more desirable from their point of view than the violent reaction against the tariff that is bound to come in the near future if protectionists shut

their eyes to changing conditions. Reciprocity offers a field for effective action, and the subject ought to have the earnest attention of the Congressional leaders in view of what may be accomplished at the forthcoming session.

*Reciprocity  
with New-  
foundland.*

Reciprocity as a system should interest us particularly with reference to our own neighbors in the Western Hemisphere. It should, as we have said, come first of all with Cuba, not merely because it would be good business policy all around, but because of clear moral obligation. There should also be a candid consideration of the treaties negotiated on our part by Mr. Kasson, which the Senate has hitherto neglected to ratify. Again, there should be immediate steps taken to meet the wishes of Newfoundland as represented by its prime minister, Sir Robert Bond, who visited Washington in the middle of September, having come here directly from England. It will be

remembered that years ago, when Mr. Blaine was Secretary of State, and Mr. Bond was serving an earlier term as premier of Newfoundland, an excellent reciprocity treaty was negotiated which failed to go into effect solely because the British Government interfered, and declined to allow Newfoundland to make her own advantageous trade arrangements. This action at London was due to Canadian representations. It is said, however, that Sir Robert Bond has now received assurances that England would not interfere with his concluding a commercial treaty with the United States. He conferred informally on the subject with the State Department last month. It was twelve years ago that he visited Washington, with the full consent of the British Government, to negotiate with Secretary Blaine the convention which Sir John A. Macdonald, the Canadian premier, succeeded in defeating. Canada is very desirous of bringing Newfoundland into her federation, while the Newfoundlanders themselves prefer to remain a distinct colony, with close business dealings with the United States. It will be a very poor and ineffective sort of statesmanship at Washington that will neglect to take prompt advantage of the opportunity to revive the plan of a reciprocity treaty with Newfoundland.

*And then with the Dominion!* While this will at first be distasteful to the Canadians, it ought to be rendered entirely agreeable to them by negotiations between our government and that of Sir Wilfred Laurier for a comprehensive and sweeping scheme of reciprocity between the United States and the Dominion. The pluckiness, high spirit, and fine practical capacity of the Canadian authorities in turning their backs toward our tariff wall, and seeking to develop profitable trade in other directions, are entitled to universal admiration. If the tariff line that stretches arbitrarily across the middle of the continent of North America were raised so high as to be absolutely prohibitive, Canada would still

THE RT. HON. SIR WILFRID LAURIER, PREMIER OF CANADA.

manage to find markets, to develop her population and her resources, and to make her career among the peoples of the earth. The United States, on the other hand, would go on prospering and developing, would irrigate the desert, exploit the West Indies and Mexico, and find outlets for her energy in Alaska, the Philippines, and elsewhere. But this arbitrary commercial division of the North American Continent would only involve serious waste of effort on both sides. We have benefited by a large migration from Canada, and the time has now come for a turn of the tide. The United States, on its part, should invite Canada's products as well as her people, while the Dominion in return should afford all hospitality to American capital and labor, to aid in the opening up of her vast natural resources. It is altogether statesmanlike for the Canadian government to seek markets in England and on the European Continent, and to promote plans for steamship lines, whether to England or to France. But Canada's highest prosperity would come under

(From a N. Y. Tribune photograph.)

**A CHARACTERISTIC SNAPSHOT TAKEN ON THE PRESIDENT'S NEW ENGLAND TOUR.**

(Winston Churchill is driving his four-in-hand, the President by his side, Senator Proctor and William Craig visible behind.)

a scheme of bold and generous reciprocity with the United States, looking toward an ultimate policy of commercial union rather than toward a probable resumption of commercial hostilities. Sir Wilfred Laurier, with his broad views, his great prestige, his popularity with both races in the Dominion, and his recognition in Washington, London, and Paris, as well as in Ottawa, as one of the foremost statesmen of our day, is the man with whom President Roosevelt's administration ought to be able to negotiate a reciprocity treaty that would insure to the permanent prosperity of the whole of North America.

*The President's Vacation Season.*

Although President Roosevelt managed to get some fragments of enjoyable vacation at his permanent home on Long Island, and maintained throughout the summer his remarkable standard of buoyant and virile health, he was constantly occupied with affairs which would have subjected an ordinary man to a severe if not

exhausting strain. His secretaries were busy in offices improvised over a bank at Oyster Bay. The great newspapers and press associations had their able representatives always on the ground. Visitors were arriving,—not in large numbers, but without cessation,—from all parts of the country. No affairs of state were neglected in so far as the President was personally responsible, however much or little the heads of departments may have been doing through the summer. But these Oyster Bay occupations were as play compared with the strenuousness of the President's touring, which comprised a twelve-days' trip through New England, lasting from August 22 to September 3; a Southern trip, from September 5 to 10; and, finally, a Western trip, which began on September 19, with an elaborate schedule of constant travel and speaking, to last until October 7.

*An Accident in New England.*

The New England trip, with its well-arranged itinerary through Connecticut, Rhode Island, Massachusetts, Maine, New Hampshire, and Vermont, furnished a series of striking speeches which were reported and discussed throughout the entire country. But it will be remembered by most people, not for its speeches, but for the President's exceedingly narrow escape from an accidental death. On September 3, while being driven in western Massachusetts through the beautiful Berkshire region from Dalton, the home of Governor Crane (who was one of his companions) to Lenox, the President's carriage was struck and crushed by a trolley car moving at a seemingly uncontrollable speed. William Craig, the United States Secret Service officer who was in constant

LEAVING SENATOR HOAR'S HOME, AT WORCESTER, FOR A DRIVE ABOUT THE CITY (THE SENATOR SEATED BY THE PRESIDENT, AND WILLIAM CRAIG ON THE DRIVER'S SEAT).

attendance upon the President, rode by the side of the driver, and was instantly killed. The driver was at first thought to be fatally injured, but he was afterward reported as recovering. With the President in the carriage were Governor Crane and Secretary Cortelyou. These gentlemen were all three more or less bruised and stunned, but none of them seriously hurt. The President's face was somewhat injured and swollen, but he continued on his way, omitting the speeches that were to have been delivered on

this last day of his New England pilgrimage. There was, of course, no criminal intent involved in the disaster, only a carelessness that might well seem criminal on the part of both motorman and coachman. The accident led to much discussion of the risks involved in these Presidential tours. There is very little danger of railroad accidents, but a considerable margin of risk in the innumerable carriage drives, automobile spurts, and coaching experiences to which ambitious local committees subject the President.

PRESIDENT ROOSEVELT AS AN OPEN-AIR ORATOR.

The Western trip came to an abrupt end on September 23, in Indiana, by reason of an abscess below the President's left knee resulting from a bruise received in the Massachusetts accident.

*The President's Speeches.* President Roosevelt's tours have been fruitful in admirable speeches, well varied in topics but not capriciously so, nor yet planned to produce the mere effect of versatility. These speeches have been able and statesmanlike, charming in their directness and candor, while never trivial or undignified. The ordeal was a severe one. It would have been much easier for the President to make a virtue of silence—of absorption in executive tasks.

While to the newspaper reader he would seem to have spoken much, it should be remembered that to the actual hearer he has spoken only once. Thus, from the headlines in the more sensational papers, the reader during his New England tour might easily have got the impression that the President was leading a crusade against trusts. Such an impression was heightened by the character of a large number of cartoons that appeared in various parts of the country. We reproduce one on another page from the New York *Herald* as typical. Yet, far from leading an angry or inflammatory movement against large aggregations of capital, the President, whenever he spoke upon the trust question, was as calm, as candid, as ju-

dicial in tone,—as reassuring, in fact,—as any American public man of any party who has ever delivered himself upon such topics.

*His Talk About "Trusts."* His speech at Providence, which was devoted especially to the "trust" issue, merely set forth in attractive and fresh phraseology the opinions to which he had repeatedly committed himself before, and with which he had made every one familiar who was at all conversant with the subject. The proposal to bring great corporations doing interstate business under federal auspices, with a view principally at the outset to securing a reasonable but not inquisitorial amount of publicity as to their condition and methods, is certainly not a novel suggestion to those who took the trouble to read President Roosevelt's message to Congress last December. The President has made no special plea for an amendment to the Constitution, assuming rather that considerable legislation might be had without such a step. In suggesting such an amendment, however, he was treading on no new ground, inasmuch as the conservative Republican elements in Congress had, before he came into the White House, not only proposed this idea, but actually carried such an amendment through one House. What Mr. Roosevelt said in his New England speeches on trusts,—far from being alarming on the score of novelty, or disconcerting as evidence of hostility to business progress,—was exactly in the line of suggestions which the most responsible corporation interests in Wall Street had last winter cheerfully accepted and endorsed. The curious thing, therefore, about the revived discussion of the trust question was not the President's position, but the insidious attacks upon that position emanating beyond question from Wall Street sources. The alarms were sounded against the idea of a constitutional amendment, as if, forsooth, the President had now proposed this for the first time.

THE PRESIDENT EMPHASIZING A FAVORITE POINT.

(The scene is at Asheville, N. C.)

*Trying to "Punish" Roosevelt.*

The so-called "magnates" of the railroad and industrial world were whispering to one another and to the newspaper organs in their control that President Roosevelt was unsafe; that he was hostile to property interests; that the New York Republicans must not in their forthcoming convention endorse him for a second term under penalty of no contribution to the campaign fund; finally, that he must not by any manner of means be nominated in 1904. The little flurry in New York politics resulted in the discovery that President Roosevelt was sure to have the endorsement of the Republicans of his own State, as he had been receiving that of practically every other State which had held a Republican convention thus far this season. Whatever mistakes President Roosevelt may have made, he has tried to do his duty exactly as he has been able to see it. Many of the great corporations, if not the majority of them, are in our opinion doing a legitimate business under new methods that are not only inevitable but desirable and good for the country. Such institutions have nothing to fear from a

man like President Roosevelt, and any attempt on their part to punish him for trying to enforce the law as he finds it and to do his duty according to his oath of office, will have shown, to say the least, a lack of discrimination. President Roosevelt is not given to riding hobbies, and is not trying to smash the trusts; nor is he disposed to think that he can usurp the functions of the law-making branch of the Government. He has said nothing on the trust question that is not well within the expressions of Republican national and State platforms. On various topics,—such as the history of our administrative work in Porto Rico and Cuba, the Panama Canal and our commercial progress, the Philippines and our position in the Orient, the Monroe Doctrine, the army and the navy, irrigation and internal progress, and many other themes,—the President has in these recent speeches shown a breadth of intelligence, a knowledge of American conditions and public policies, and a capacity to represent and express the best prevailing American opinion, that entitle him to the confidence of the country as a statesman of both mature and symmetrical views.

*The Maine and Vermont Elections.* The first fruits of the political season have already been gathered in, while the main crop awaits the Ides of November. Beginning with New England, the Vermont election was held on September 2, and that of Maine on September 8. The September balloting in Maine is always watched with interest by the wise men and statisticians of both parties, as indicating to some extent the general drift of national sentiment. The Republicans had expected this year a plurality of about 25,000 for Governor Hill; the actual figures proved to be 27,538. Naturally, the Republicans carried all the Congress districts and nearly all the seats in the State Legislature. The result is claimed by the party experts as satisfactory in its bearings upon the Congressional campaign at large. But this larger campaign has not really begun.

PRESIDENT ROOSEVELT SPEAKING FROM A CAR PLATFORM.

*The Liquor Issue in Three States.* There was more real feeling in Maine over the election of county sheriffs than anything else, and this entirely with reference to the enforcement of the prohibitory liquor law. It would appear that while everybody in Maine is "for the law," a large part of the voters are agin its enforcement. In Vermont, the liquor question was decidedly the paramount issue this year, and it led to a three-cornered contest and a failure to elect a governor. Under the State constitution a majority of all the votes cast is requisite to a choice. The regular Republican candidate, Gen. J. G. McCullough, had the largest number of votes; but the independent Republican candidate, Mr. P. W. Clement, who was running on a local-option and high-license platform, came in as a close second. Regarding the Democratic vote as also anti-prohibition, it is plain enough that a considerable majority of the voters of Vermont are now opposed to the existing law. The State Legislature this fall will have to complete the gubernatorial election, and it is probable that General McCullough will be successful. In New Hampshire, while the liquor question is a leading topic

of the campaign, it does not project itself as a party issue. A prohibition law has been on the statute books for a generation or more, and the Republicans, rather than the Democrats, have been its sponsors. The Republicans have now, in their recent State convention, declared their dissatisfaction with it, and they have asked the next session of the Legislature to take the question up and work out a modification of the system. The Democrats, on their part, have charged the Republicans with hypocrisy and evasiveness on the subject, and declare themselves for the enforcement of the law while it stands, but for the substitution of a tax system in case prohibition cannot be made effective. The New Hampshire Republicans have nominated Hon. Nahum J. Batchelder for governor, and the Democrats have nominated Hon. Henry F. Hollis. In pronouncing for the renomination of President Roosevelt in 1904 the New Hampshire Republicans expressed the prevailing party sentiment of all New England.

*Conservative  
Democracy  
Triumphs in  
Massachusetts.*

The Republicans of Massachusetts do not hold their State convention until October 3. The Democratic convention was, however, held on September 17, under circumstances in every way interesting to the country at large. The question was squarely at issue whether the Bryan wing of the party, under the lead of Mr. George Fred Williams, or the conservative wing, under the lead of Mr. Josiah Quincy, should dominate the convention. The candidate of the conservatives for governor was Mr. William A. Gaston, a Boston lawyer and corporation director of ability and high standing. The candidate of the Bryan Democrats was Mr. Charles S. Hamlin, also a Harvard man and Boston lawyer, prominent as a high Treasury official in the last Cleveland administration. Colonel Gaston was nominated by an overwhelming majority, and Mr. Josiah Quincy, who was the hero and in every way the dominant figure of the convention, secured the adoption of a platform which he had himself written. This platform makes no note of the money question, but devotes itself to what Mr. Quincy declares to be the real and vital issues of the present. It gives principal prominence to tariff reform and the regulation of trusts. It specifically demands reciprocity with Canada. This year's campaign had its real beginning, in our judgment, with four almost simultaneous events,—namely, the retirement of Speaker Henderson from the contest in Iowa, the conference of Republican Senators with the President at Oyster Bay, the Democratic convention in Massachusetts, and, we may add, the speech of

Senator Orville H. Platt in exposition of national policies at the Connecticut Republican convention. We reprint elsewhere (see page 450) Mr. Quincy's Massachusetts platform as a Democratic document, and the Connecticut resolutions, with a part of Mr. Platt's expository speech. The Connecticut Republicans, it may be noted incidentally, nominated Mr. Abram Chamberlain for governor, and endorsed President Roosevelt for nomination in 1904.

*New York  
Republicans.* In New York it was all along a foregone conclusion that the Republicans would renominate Governor Odell at the State convention, at Saratoga, on September 23. It was for a time very doubtful whether certain political and financial interests would not succeed in their determination to prevent an endorsement by this convention of President Roosevelt's candidacy for a second term. But after

HON. JOSIAH QUINCY, LEADER OF MASSACHUSETTS  
DEMOCRATS.

much discussion in the newspapers (and far more effective discussion in private conclave), the Republican leaders came to the conclusion that it would be best that the President's own State should not be missing from the long list of States whose Republican conventions were pronouncing for the nomination of the President by common consent two years hence. The primary elections, held on September 16, made plain the

Photo by De Young, New York.

CHARLES F. MURPHY, NEW HEAD OF TAMMANY HALL.

continued strength of the existing leaders of the Republican organization, Senator Platt remaining by common consent as head of the party.

*New York Democrats.* In the other political camp the leadership of ex-Senator David B. Hill became clearly established in the State at large, while attempts at Democratic anti-Tammany reorganization in New York City were shown to have little following. Within the Tammany ranks, the primaries brought two personalities into strong prominence. One of these is Mr. Charles Francis Murphy, who has now been placed at the head of Tammany Hall by the dominant Croker influence. Murphy is a saloon-keeper, who, from his boyhood, showed qualities of leadership in his East Side neighborhood. He is still a young man, at forty-four. He was a street-car driver in his early manhood, but opened a saloon at the age of twenty-one, and he has been active in local Tammany politics for exactly half of his lifetime. The other personality brought into prominence as a result of the primaries is that of William S. Devery, formerly chief of police, who was excluded from office with the advent of the Low administration. Devery decided to go into active politics, and aspired to become the official Tammany leader of his district. How he lavished money upon the men, women, and children of his ward in outings, picnics, and other diversions

during the summer was one of the chief topics of the New York newspapers. It is said, whether rightly or wrongly, that he spent \$50,000 in winning the favor of enough Tammany voters in one little locality to give him the leadership. The general situation simply shows that Tammany is not in the least regenerate, and that when the issues are drawn in next year's mayoralty campaign there will be exactly the same necessity for a non-partisan union of anti-Tammany forces as there was last year when Mayor Low was elected. The results of the Democratic State convention, which was called for September 30, could not be foretold when these pages were closed for the press, but it was quite commonly believed that Mr. Hill had cleared the way for the nomination of Mr. Bird S. Coler, formerly Comptroller of the city of New York, as candidate for governor against Mr. Odell.

WILLIAM S. DEVERY.

MAYOR TOM L. JOHNSON STARTING FROM HIS HOME, ON EUCLID AVENUE, CLEVELAND, IN HIS CAMPAIGN AUTOMOBILE.

*Tom L. Johnson and the Ohio Democrats.* The Democratic situation in Ohio is very different from that which Josiah Quincy dominates in Massachusetts or that which David B. Hill controls in New York. The great personality of the Ohio campaign on the Democratic side is Mayor Tom L. Johnson, of Cleveland. The State convention, held on September 3, was notable chiefly for the boom it gave to Mr. Johnson as a Presidential candidate. He presided over the convention, and furnished the committee on resolutions with a ready-made platform, which was promptly accepted and adopted. Everybody wore buttons bearing Mr. Johnson's picture and inscribed: "Tom L. Johnson in 1904." The pending campaign, in so far as the Democrats have attempted to shape it, unlike those of the Eastern States to which we have alluded, is upon strictly State and local issues. The State Legislature, in special session, has been engaged in constructing a general code for the government of Ohio cities. Mr. Johnson's platform declares for municipal home rule and for methods that will subject public-service monop-

lies to strict regulation and control. It also favors sweeping reforms in the State system of taxation. Allusions to national issues are confined to the opening paragraph, which is so direct and unequivocal that it deserves reproduction. It is as follows:

In State convention assembled, we, the Democrats of Ohio, hereby acknowledge and declare our continued allegiance to the Democratic party of the nation, and on national issues reaffirm and endorse the principles laid down in its last national platform adopted at Kansas City, and faithfully and ably represented in the Presidential campaign of 1900 by William Jennings Bryan. Regarding these principles as opposed to imperialism and colonialism, as opposed to government by injunction, as opposed to trusts and trust-fostering tariffs, as opposed to financial monopoly, and as opposed to all other legalized monopolies and privileges, we condemn every effort to repudiate or ignore them.

*A Picturesque Campaign.* A governor is not elected this year in Ohio, and the first name in the list of offices to be filled is that of secretary of state. The Johnson men, who like to

do something more original and picturesque than to apportion the offices among ordinary politicians, chose for secretary of state a Cincinnati clergyman, the Rev. Herbert S. Bigelow, pastor of the Vine Street Congregational Church,—a good speaker, and a strong advocate of social and economic reform. Mr. Bigelow was promptly scheduled to speak in every county in the State, and Mr. Johnson was also announced to speak every night until the election in November. To that end a great tent was provided for the audiences, a fast automobile was drafted into service for Mr. Johnson's personal use, and a regular caravan of coaches and vehicles was provided for his political retinue. All this is at least untrammelled, and it provides Ohio people with entertainment as well as with argument. The pending problems of city government are made especially prominent in Mr. Tom L. Johnson's campaign, in view of the fact that he is assisted by some well-known municipal experts.

*Anti-Bryan  
Democrats Win  
in Wisconsin  
and Iowa.*

The Democrats of Wisconsin nominated the mayor of Milwaukee, David S. Rose, for governor early in September, and achieved a notable victory for the cause of party reunion by bringing back into the fold that large element of Gold Democrats, led by such men as ex-Senator Vilas, which had for several years stood aloof. The platform was devoted principally to State issues, but it contained planks strongly attacking the present tariff system and the trusts. The convention refused to endorse the Kansas City platform. The return of the Sound-Money Democrats will doubtless be felt as a practical loss by the Republicans of Wisconsin, who have by no means reconciled the differences which were revealed in the convention that renominated Governor La Follette. It is now thought reasonably certain that Senator Spooner will be reelected without regard to the conditions laid down for him in the State platform. The Iowa Democratic convention, also held in September, was interesting chiefly for its protracted contest over the question whether or not to endorse the Bryan Kansas City platform. Such endorsement was finally refused by a vote of 384 to 344.

*Politics in  
California.*

In the great State of California the Republicans have brought forward a striking personality as their candidate for governor. Dr. George Cooper Pardee, who secured the nomination on the sixth ballot, after the collapse of the strong movement for the renomination of Governor Gage, is, like his father before him, a prominent physician of Oakland. He has also, like his father, served a

term as mayor of that city. He is a graduate and a regent of the State University of California, studied several years in the University of Leipsic, and represents professional standards and good citizenship at their best. This is not regarded as a Democratic year in California, and that party is reported as being more apathetic than usual. Its nominee for governor is the Hon. Franklin K. Lane, city attorney of San Francisco, and a man of recognized qualifications.

*In Southern  
States.*

In the Southern States the elections of November are merely a perfunctory ratification of the results of the real contest in the Democratic primary elections. It is thus a settled fact that Gov. William D. Jelks is to have another term as chief executive of Alabama, and that in South Carolina Mr. D. C. Heyward, a rice planter thirty-eight years of age,—who has not been a political figure heretofore, and who represents the conservative element,—is to be the next governor by virtue of a victory at the primaries won against the Tillman element. Mr. Asbury C. Latimer, who will succeed Mr. McLaurin in the United States Senate, belongs, on the other hand, to the Tillman wing of the party. Arkansas, like Vermont, has an early State election, and on September 1 the usual Democratic majority was rolled up, and Gov. Jefferson Davis was awarded a second term.

*This Country  
as an Exem-  
plar.*

Without the slightest show of aggressiveness, the United States has of late done many things to engage the attention of the world at large. Two matters were before the European public last month which set the Government of the United States in a position that won the approval of wise and humane people. One of these was the arbitration at The Hague of a question in dispute between the United States and Mexico. It was not a question that in any manner threatened a breach of good relations between the two republics, but it was one which had to be settled somehow, and which lent itself peculiarly well to the processes of arbitration. So it happens that the United States sets the world an example by being the first great nation to avail itself of the services of the Hague Tribunal. Mr. Stead has revisited The Hague, and has written us an article upon this case and its relations to the arbitration movement in general (see page 419). Another matter also reflected credit upon our State Department. It is well known that the Jews of Roumania are leaving their country in large numbers in consequence of discriminating laws against them, which are almost incredibly severe and unjust,

and which make it well-nigh impossible for them to pursue any of the ordinary means of livelihood. The greater part of these unfortunate Roumanians have been coming to this country, and they do not form a desirable class of immigrants. Protests to the Roumanian Government through our own minister have been unavailing. Secretary Hay has, therefore, sent a strong statement of the case to the great European powers which were signatories to the Berlin treaty of 1878, to which treaty Roumania owes its existence as an independent kingdom. Mr. Hay calls attention to the fact that Article 44 of the Treaty of Berlin prescribes equality for all classes in Roumania in terms that are obviously violated by the present policy which excludes the Jews from agriculture, the professions, and most of the trades, and thwarts and handicaps them at every turn. The British Government promptly recognized the force of Mr. Hay's argument, and opened negotiations with the other European powers, which may result in a conference on the subject of the condition of the Roumanian Jews.

*The Monroe Doctrine in Theory and in Practice.*

The Monroe Doctrine has been a leading topic of discussion in the European press of late, but not to any very intelligent or effective end. That doctrine will, of course, be best justified, first, by our vigilant show of both ability and readiness to maintain it; and second, and not least important, by our use of it always for good and beneficent objects. We have been much in evidence in Caribbean waters and at the Isthmus of Panama of late; but, quite apart from the Monroe Doctrine, we are bound by treaty stipulations to protect the Panama Railroad and maintain order on the isthmus. Apropos of the continued revolutionary disturbances which required the presence of our warships last month, it ought soon to become evident on all sides that the simplest and the cheapest way to maintain order there is to secure the transfer of sovereignty from Colombia to the United States. The isthmus is no essential part of Colombian territory, and that republic would be far more compact and easily managed if the State of Panama were detached. Far simpler than negotiating for perpetual canal rights would be a negotiation for the sale and transfer of the

KING CHARLES OF ROUMANIA AND HIS QUEEN ("CARMEN SYLVA").

isthmian strip from Colombia to the United States for a gross sum. In any case, the United States is destined henceforth and forever to protect and police Panama both by sea and by land. A possible issue involving the Monroe doctrine is said to be finally settled as a result of the Danish elections last month, which removes all doubt as to the completion of the sale of the Danish West Indies to the United States.

*The Troubles of Haiti.*

The current revolution in Haiti, which has been proceeding for several months in the somewhat desultory fashion of most Latin-American revolutions, was brought sharply to the public attention by a somewhat startling incident early in September. The gunboat *Crête-d-Pierrot*,—which was commanded by Admiral Killick, and which was aiding the revolutionary movement organized last spring by General Firmin,—seized the German merchant steamer *Markomannia* on September 2, and took possession of war munitions that were being carried to the provisional government of Haiti. On September 6, the German gunboat *Panther* destroyed the *Crête-d-Pierrot* at the entrance of the harbor of Gonaives, a city in possession of the revolutionists. According to the newspaper reports, the commander of the German gunboat demanded the surrender of the *Crête-d-Pierrot*, but before this could be accomplished Admiral Killick personally fired one of the magazines. The Germans thereupon trained their guns upon the boat and completed its destruction. Admiral Killick and a few others went down with their vessel. Killick's father was a Scotchman and his mother a Haitian.

The *Crête-d-Pierrot* had formerly belonged to the Haitian Government, but early in the summer it had deserted to the Firminist cause, and the provisional government then declared Killick a pirate, and invited his capture by any foreign nation. The United States Government has not made any public protest to Germany against the course pursued. The principal fighting between the land forces in Haiti has been at Limbe, a town about eighty miles north of Port-au-Prince. The place was captured by the revolutionists on August 9, but they lost possession on August 26. General Nord, Minister of War of the provisional government, was forced to evacuate the place, however, on the following day. He subsequently made two attempts to recapture the town, on September 4 and 17, but each time was repulsed. The troops on each side are said to number about three thousand. The election of members of the lower branch of the Legislature has been completed, but the new Senate has not yet been chosen, and the provisional government, therefore, continues in power. Haiti is certainly in a most forlorn state, but it is a total mistake to assume that the cause of civilization is hopeless in this

negro republic. The isolation of its people from effective American influences is due to the fact that they speak French rather than English quite as much, perhaps, as to any other cause.

*Further Eruptions of West Indian Volcanoes.* If there had been no destructive eruption of volcanic Mont Pelée in Martinique last May, the more recent eruption at the end of August and beginning of September would have appalled the whole world. Yet somehow this last convulsion, which spread devastation over a larger territory than the earlier one, seemed to attract very little notice, although it is said to have caused the death of not less than 2,000 persons, and to have buried under ashes and lava ten times as much territory as the eruption of May, which caused the death of about 30,000 people. In spite of gloomy apprehensions as to the future of Martinique, it seems not to be believed by more thoughtful people that Fort de France and the southern part of the island are in much danger. It is also a mistake to suppose that there is want of food or lack of work for the people who remain in this unfortunate island. The French expedition that was sent to study scientific and practical conditions has reported that the entire Mont Pelée region must be evacuated. Prof. Angelo Heilprin, of Philadelphia, who has returned, was an actual witness of the eruption of August 30. What is now most feared, not only in Martinique, but in others of the series of islands constituting the Windward chain, is that volcanic forces may cause a tidal wave which might destroy hundreds of thousands of lives in the towns and cities along their coasts.

CAUTIONED BY THE REFEREE.  
From the *Eagle* (Brooklyn, N. Y.).

*On the South American Continent.* Not to attempt a summing up of incidents in the confused Venezuelan situation, it may be said that the impression gained ground everywhere last month that the cause of President Castro was doomed, and that the revolutionists under the lead of General Matos were almost certain to prevail in the very near future. There have been no fresh developments, so far as we are aware, in the dispute between Brazil and Bolivia over the question to which pertains the sovereignty over that great region of rubber forests and other natural resources known as Acre. Bolivia had ceded the rubber and other privileges to an Anglo-American syndicate, and Brazil had denied Bolivia's ownership. If there is anything in the rumors last month of vast international consolidations of capital engaged in the rubber trade and manufacture, the question of Acre may take on a new importance. Meanwhile, we reproduce a Brazilian caricature of President Roosevelt, who is supposed to

personify the Monroe Doctrine in a very disagreeable manner, and to have designs, incidentally, upon Acre. It is well to believe that this does not represent the most intelligent opinion in Brazil. The one object of the Monroe Doctrine, so far as the Brazilians are concerned, is to give them the moral backing of the United States in holding every foot of territory against European aggression, and in maintaining and developing their republic in their own fashion. The Monroe Doctrine means that the United States would

TO ROOSEVELT.—From *Tagarela* (Rio Janeiro).

(The above cartoon is from a weekly journal of politics and affairs published at Rio de Janeiro—of course, in the Portuguese language—called *Tagarela*. It is accompanied by a poem in four stanzas, which accuses the United States, under the tutelage of Roosevelt, of wishing to carry on further annexation. But this policy, it declares, has its dangers and anxieties; and while the "Monroe crowd" may push their policy by force in other directions, Brazil won't stand it.—"no, sir" (*nao senhor*)! "Why," says this Portuguese rhymester, "do you send your iron tub, which you call by the Indian name *Iowa*? If you propose to put your claws upon Acre, you had better leave;" with more to the same effect.)

not willingly see Brazil suffer loss from French designs by way of French Guiana on the north, nor yet from alleged German designs through colonization in the South.

The unfortunate anthracite coal strike had lasted for some five months as these pages were closed for the press late in September, with the almost complete deadlock still unbroken. The group of associated railroads which had formed a monopoly in anthracite coal mining, and had established an artificial control over output, price, and market, were squarely met, on the other hand, by the combination of men who had taken advantage of the Pennsylvania laws relating to the qualifications of miners to establish an almost equally firm monopoly control over the supply of labor necessary to operate the mines. The really aggrieved and defrauded party in all this situation has been the public, which has been shamefully inconvenienced. The operators, who had made a tight monopoly out of mining and selling coal, are immediately responsible. It is not satisfactory, therefore, that these operators should come before the public with arguments and complaints about the unreasonableness of their laborers. Men who have assumed to acquire control of an article essential to common use and welfare ought to be wise and skillful enough to keep on good terms with their workmen. They are rather absurd when they affect an injured air because coal miners associate themselves in trade unions for the purpose of making the best contract they possibly can in the sale of their labor. Private ownership of coal mines is subject to the public policy and well-being; it is not at all an infeasible right. The right of workingmen, on the other hand, to stand out for the best terms possible, and to associate themselves for the better accomplishment of their purposes, is too fundamental to be questioned. The miners have been perfectly willing from the outset to submit their claims to any sort of impartial arbitration. The operators, on the other hand, have never for a moment dared to arbitrate anything. The only reasonable answer from the standpoint of the aggrieved public to the stubborn operators is simply this: Men who refuse to arbitrate ought to be men skillful enough in the conduct of their business to be able to carry it on without break or interruption, and without annoying the public with the friction of their internal problems.

The practical issue involved is not one of right or wrong, any more than is the making of any other employment contract. It is simply that the miners are

*A Mere Matter of Free Contract.*

trying to sell their labor at a high price, while the operators are trying to buy it cheap. The operators affect superiority, and say that the miners ought to take the wages that the employers are willing to pay. Their arguments have been irrelevant, but their tactics have been eminently practical. They have simply closed the mines, put up the price of coal, waited for the miners to run out of funds, and counted upon starving them into submission. Neither side has been entitled to much sympathy. Public attention should have been devoted to the finding of a solution for the benefit of the people who want to buy coal at a reasonable price, and who want to prevent the myriad indirect disturbances that come from protracted industrial disputes. The only monopolies that justify themselves are those which can show that by virtue of unified control they are serving the public more regularly and more cheaply. The anthracite monopoly is the worst in this country, because it exists solely for the sake of maintaining highly artificial and improper prices. Attempts in the earlier part of September to end the strike through political pressure were unavailing. It was the impression later in September that the strike would end in the course of a very short time through some disguised and roundabout concessions on both sides that would not wholly sacrifice the silly pride that had been standing in the way of arbitration, or some other common-sense solution of the quarrel.

*Business  
in General.*

In spite of such a depressing factor as this long-drawn-out coal strike, —which never would have occurred if the men who are so busy in promoting railroad and industrial consolidations were fit to deal with labor problems,—the business conditions of the country are marvelously good. This, of course, is due, not to the gentlemen who promote trusts, but to the skill, intelligence, and industry of the American people as a whole, to the richness of the soil, and to the favoring climatic conditions that have given us bountiful crops. The optimistic corn-crop estimates of August were modified in September as a result of premature frosts in the Northwestern States; but the crop will still be very large. Foreign trade has continued good, our imports thus far this year being considerably greater than in any previous year of the country's history. Exports, on the other hand, have sunk below those of any year since 1898. This is due wholly to a falling off in the export of our agricultural products, which, in turn, may be attributed mostly to the shortage of last year's crops. Taking the aggregate volume of the five principal cereal crops of the coun-

try, it is estimated that we shall this year produce about a thousand million bushels more than last year, this representing an increase of more than 30 per cent. This difference ought to have a very favorable effect upon both internal and foreign trade during the year to come.

*Public Revenue  
and the Tariff  
Question.*

In spite of the enormous reduction of national revenue by the abolition of internal taxes imposed at the beginning of the Spanish War, the income of the Government at Washington has continued to be embarrassingly superabundant. This has been due principally to the unexpected increase of imports and of the large duties paid thereon, which, in turn, is the result of a period of continued prosperity that has led to an unprecedented demand for costly fabrics, and luxuries of all sorts. Our own people have been complaining very much of the methods of our great corporations in their successful invasion of foreign markets by the device of selling abroad, not only at lower prices than those of foreign manufacturers in their own countries, but much cheaper than these same American corporations sell to us here at home. This is a game, however, that other people can play; and undoubtedly the English, German, and French manufacturers have lately been making special efforts to sell in American markets, and have made their prices low to catch the trade. Much of the newspaper criticism of American manufacturers for selling cheaper abroad than at home has been lacking in intelligence and in knowledge of business methods. The only thing now to be seriously feared is that the agitation in favor of tariff reform, and against large industrial combinations that manufacture tariff-protected goods, should arouse distrust, and so bring about a state of business depression. There is no reason at all why the tariff situation should be made the football of politicians to the exclusion of the knowledge and judgment of business men and economic experts.

*Some British  
Topics.*

The British Parliament will assemble again after recess on the 16th of October, with quite enough on its hands to make certain a strenuous if not a turbulent session. The Irish situation is troublesome in the extreme, and the new phases of the land question must be dealt with by methods invented to meet the fresh emergency. The Balfour government, furthermore, is obliged to take up and endeavor to pass the education bill which was carried over from the last session,—a bill calling for the public support of church schools, and reversing the policy of public elementary education entered upon thirty years ago. This school question is

uniting again all the Liberal and Radical elements. The remarkable change of political sentiment in the country, as shown some weeks ago by the special election in a Leeds constituency, has again been shown still more strikingly by a contest for a vacant Parliamentary seat at Sevenoaks, where the large normal Tory majority disappeared almost incredibly. Furthermore, the South African question is bound to have all sorts of annoying sequels. The general colonial situation is not what Mr. Chamberlain would like to have it. His conference of colonial premiers proved inopportune. If it had not been held, and if men of the great prestige of the premier of the Canadian Dominion and the premier of the Australian Commonwealth had not been in London to make protest in the very face of the Colonial Secretary, the plan of suspending the self-governing constitution of Cape Colony would not have been frustrated.

*Mr. Chamberlain and South Africa.*

As matters stand, the Colonial Office is embarrassed by the fact that the majority of the members of the Parliament at Cape Town are connected with the so-called Afrikaner Bond, which favors the Dutch race and is leniently inclined toward those who aided the Boer republics in the recent war. Sir Gordon Sprigg, the Cape Colony premier, is carrying on his government through the support of the Dutch element. Meanwhile, the Boer generals now in Europe have presented to Mr. Chamberlain a bill of demands on behalf of

their people that has made John Bull fairly gasp with astonishment and rage at such presumption and impertinence. The generals demand the completest sort of compensation for all losses of private property during the late war; ask grants of money in aid of the Boer widows and orphans; demand the restoration of confiscated lands; urge the immediate carrying out of full amnesty, the prompt return of the Boer war prisoners, the cessation of military government, the establishment of local home rule, the re-cession to the Transvaal of the district that was given to Natal, and a good deal else in the same line. These demands were met by Mr. Chamberlain's refusal in general and in particular to comply with most of them; but they led none the less to unpleasant discussions.

*Sir Wilfrid Laurier in Paris.*

The independent tone assumed by the governments of Australia and Canada has not been wholly agreeable to England of late, and Sir Wilfrid Laurier's reception in Paris on his recent visit, which was with as much honor as if he were the head of a great independent state, caused a little discomfort to British leaders of a certain advanced imperial-federation school. Sir Wilfrid is reported as having had protracted conferences with the French Foreign Office on the establishment of commercial relations under which Canada would make the same tariff concessions to the French republic that she has already made to England. It was further proposed that Canada and France should jointly subsidize a direct steamship line.

THE GOLFER (BALFOUR) AND THE SEVENOAKS (apropos of a recent by-election).

"H'm—I don't know how I'm to get over this. I can't get through it."

From *Westminster Budget* (London).

*Some French Matters.*

The excitement in France over the firmness of the government in enforcing the laws against the unauthorized schools of the religious orders has greatly abated. External questions have, in turn, absorbed the attention of the French press. The somewhat aggressive tone of M. Pelletan, the picturesque Minister of Marine, in several recent speeches, has formed a subject not merely of local discussion in France, but of wide international comment. One of these speeches was delivered

M. PELLETAN, FRENCH MARINE MINISTER, MAKING A SPEECH.

at Ajaccio, in Corsica, where he discoursed with much frankness on French power and influence in the Mediterranean, and demanded the thorough fortification of Corsica as a link between the mother country and African France, and a strategic base against Italy. Another of his speeches was at Biserta, on the coast of Tunis, where the French have been carrying out a great project for the improvement of the harbor and port, and its fortification as a modern naval rendezvous and stronghold. M. Pelletan's allusions to England, Germany, and Italy were regarded in many quarters as offensive, indiscreet, and incomprehensible, in view of the fact that the orator was actually in power as a member of the cabinet. But it is better to regard his speech as evidence, first, of the rapid recovery of French self-confidence in her international position; and, second, as having been meant rather as a scientific setting forth of French strategic plans and projects than an expression either of boastfulness or of hostility. Undoubtedly the French are disposed to do what they can to cultivate good relations in various directions, and it is known that they are particularly desirous of gaining a strong influence over Spain. The popular French ambassador at Washington, M. Cambon, who represented the Spanish at Washington with such wisdom and tact during the recent war, is going to Madrid to help promote close relations between the two neighboring powers. He will be succeeded at Washington by M. Jusserands, a brilliant diplomat and author, who has been serving France as minister at Copenhagen.

#### German Concerns.

The Emperor of Germany made his visit to Posen in the opening days of September, and rode bravely with his retinue through silent streets, past rows of undecorated houses. The Polish people made no disorder, but showed their feelings by abstaining from any manifestations of welcome. The great manœuvres in Eastern Prussia, attended by American as well as by English and European visiting officers, went off with no little *éclat*. In spite of the Kaiser's attempt at a mildly conciliatory speech in Posen, there is no sign of reconciliation. The Germans are buying up

the estates of Polish landowners in order to colonize them with German-speaking Prussians, and the Poles of all the world, through secret societies and otherwise, are in turn bringing concentrated support to the discontented people of their own race. Meanwhile, social and economic unrest are apparent throughout most parts of Germany. The bankers have been in session to defend capitalistic interests; the manufacturers are up in arms against the proposed tariff changes in the interest of the agriculturalists; the Socialists have been holding a congress opposing militarism, and demanding various reforms. There seems to be nothing new or noteworthy in Germany's external relations, which are, at least, as harmonious as usual.

#### Affairs in the Orient.

The English are, however, in no very pleasant state of mind toward Germany, and they are particularly apprehensive of Germany's designs in the Persian Gulf. There have been many dispatches of a contradictory nature regarding the Russians in Manchuria. It is said that they are about to begin turning that country over to China, province by province; but if Manchuria does not prove henceforth to be Russian rather than Chinese, we shall be greatly mistaken. India has been having much-needed rainfalls, and the crop prospects are favorable, so that gradual recovery from famine conditions is apparent. The Japanese Parliamentary elections have been held, with the result that Marquis Ito's party has a majority of seats in the new Parliament, and will control the situation.

# RECORD OF CURRENT EVENTS.

(From August 21 to September 30, 1902.)

## POLITICS AND GOVERNMENT—AMERICAN.

August 21.—Idaho Republicans nominate John T. Morrison for governor, endorse President Roosevelt for 1904, and adopt a platform favoring tariff revision and an anti-trust amendment to the federal Constitution.

August 22.—President Roosevelt begins a twelve-days' tour of New England.

August 25.—In the Alabama Democratic primaries, Gov. William D. Jelks is renominated for governor.

August 27.—California Republicans nominate Dr. George C. Pardee for governor.

August 28.—The Nevada Silver party unites with the Democrats, nominating John Sparks (Dem.) for governor, and Representative F. G. Newlands for United States Senator....North Carolina Republicans hold a convention composed entirely of white men.

September 1.—In the Arkansas election the Democratic ticket receives the usual large majority, Gov. Jefferson Davis being reelected.

September 2.—In the Vermont election the Republican candidate for governor, Gen. J. G. McCullough, fails of a majority of all the votes cast, and the choice of governor is thrown into the Legislature; P. W. Clement, the local-option, high-license candidate, is a close second to the Republican candidate....Delaware Union (Addicks) Republicans make nominations for minor offices.

September 3.—Iowa Democrats nominate for minor offices, and refuse, by a vote of 384 to 344, to reaffirm the Kansas City platform....Ohio Democrats make nominations for minor offices, and reaffirm the Kansas City platform, with an endorsement of William J. Bryan; the convention is controlled by Mayor Tom L. Johnson, of Cleveland....California Democrats nominate Franklin K. Lane for governor.

September 4.—Wisconsin Democrats nominate Mayor David S. Rose, of Milwaukee, for governor, and refuse to reaffirm the Kansas City platform.

September 5.—Idaho Democrats renominate Gov. Frank W. Hunt, and reaffirm the Kansas City platform.

September 6, 7.—President Roosevelt visits Chattanooga, Tenn.

September 8.—In the Maine election, Gov. John W. Hill (Rep.) is reelected by a plurality of 27,538, and the four Republican candidates for Congress are elected....Bench warrants are issued at St. Louis, Mo., for 18 members and ex-members of the House of Delegates, charged with bribery in connection with street-railway legislation.

September 9.—In the South Carolina Democratic primaries, D. C. Heyward is nominated for governor.

September 10.—Texas Republicans nominate George P. Burkitt for governor, and endorse President Roosevelt for 1904....Washington (State) Republicans endorse the nomination of President Roosevelt for 1904....Colorado Democrats nominate Judge Edward C. Stimson for governor, and reaffirm the Kansas City plat-

PRESIDENT ROOSEVELT, ACCOMPANIED BY SECRET SERVICE OFFICER WILLIAM CRAIG.

(Mr. Craig was killed at Pittsfield, Mass., on September 3, by a trolley car colliding with the President's carriage. In the picture he stands at the extreme left.)

KING EDWARD HUNTING DEER IN THE ISLE OF ARRAN.

form.... New Hampshire Democrats nominate Henry F. Hollis for governor.

September 11.—Utah Republicans endorse President Roosevelt for 1904.... Idaho Populists nominate O. H. Andrews for governor.

September 12.—Nevada Republicans nominate E. S. Farrington for governor.... Colorado Republicans nominate James H. Peabody for governor.

September 16.—Delaware and Utah Democrats nominate for minor State offices.... Washington (State) Democrats reaffirm the Kansas City platform.... Announcement is made that Representative David B. Henderson, of Iowa, Speaker of the House of Representatives, has declined a renomination to Congress because of disagreement with the Republicans of his district on the question of tariff revision.... President Roosevelt starts on an extended Western trip, speaking on the tariff, trusts, and reciprocity.

September 17.—Connecticut Republicans nominate Abram Chamberlain for governor, endorse President Roosevelt for 1904, and adopt a platform opposing general tariff revision.... Alabama Republicans nominate J. A. W. Smith for governor, and endorse President Roosevelt for 1904.... New Hampshire Republicans nominate Nahum J. Batchelder for governor, and endorse President Roosevelt for 1904.... Massachusetts Democrats nominate Col. William A. Gaston for governor, and refuse to reaffirm the Kansas City platform.

#### POLITICS AND GOVERNMENT—FOREIGN.

August 31.—A French decree fixing the export bounties on sugar is made public.... Dr. J. W. Smartt is announced as the leader of the Cape Colony Progressives, succeeding Sir J. Gordon Sprigg, the premier.

August 22.—In the Japanese general election the Sei-Yu-Kai party (Marquis Ito's party) obtains 192 seats,

the Progressives 104, the Imperialists 20, and the Independents 59.

August 25.—The Chinese Government sanctions the new tariff.

August 26.—The troops of the Haytian provisional government are reported to have sustained a hotly contested engagement with General Firmin's revolutionary forces.

August 28.—The corporation of Newcastle-on-Tyne, England, adopts a plan for the extension of Newcastle Quay at a cost of \$4,000,000.

September 2.—General Zontcheff, president of the Macedonian Committee, is arrested and taken to Sofia.

September 3.—Elections for members of the upper house of the Danish Rigsdag are begun.

September 4.—The party in power wins a signal victory in the Danish elections, thus assuring the ratification of the treaty with the United States for the cession of the West Indian islands.

September 5.—A defeat of the provisional government's troops is reported from Hayti.

September 9.—The bill authorizing a loan of \$35,000,000, the minimum price of issue being 90, the maximum interest rate 5, the loan to be payable in forty years, passes the Cuban House of Representatives by a vote of 48 to 2.

September 14.—A great meeting assembles in Phoenix Park, Dublin, to protest against the enforcement of the Crimes act.

September 16.—The Dutch Parliament is opened by Queen Wilhelmina in person.... The British national debt shows an increase of \$813,567,540 as the result of the Boer War.

Photo by Rockwood.

BISHOP J. M. FARLEY.

(Named by the Pope as successor to Archbishop Corrigan, of New York).

#### INTERNATIONAL RELATIONS.

August 22.—It is officially announced in Paris that M. Jusserand has been named to succeed M. Cambon as French ambassador to the United States.

August 25.—A parcel post is inaugurated between the United States and Great Britain.... An order of the Porte commands the satisfaction of all demands made by the United States upon Turkey.... Germany, Great Britain, and France protest against the blockade of Venezuelan ports.

August 27.—The King of Italy is welcomed by the Emperor of Germany at Potsdam.

August 28.—The appointment of Mgr. Guidi as apostolic delegate to the Philippines is announced at Rome.

August 29.—Japan consents to submit to arbitration the question of liability of foreigners to the house tax.... The new Chinese tariff treaty is signed by the representatives of Austria, Germany, England, Belgium, Japan, Holland, and Spain.... It is reported that a basis

of agreement on the Acre question has been reached by Brazil and Bolivia.

September 5.—The British commercial treaty with China is signed.

September 7.—The Haytian revolutionist (Firminist) gunboat *Crête-à-Pierrot*, flagship of Admiral Killick, is sunk by the German gunboat *Panther*.

September 8.—Albanians oppose with violence the establishment of a Russian consulate at their capital.

September 10.—Russian officials in Manchuria are ordered to expel foreigners from the province.

September 11.—The United States battleship *Wisconsin* and the cruisers *Cincinnati* and *Panther*, with a battalion of marines, are ordered to the Isthmus of Panama for the purpose of protecting American interests while the Colombian revolution is in progress.

September 15.—Hearings are begun in the "Pious Fund" arbitration case between the United States and Mexico before the international court at The Hague (see page 419).

September 16.—The French Minister of Marine, M. Pelletan, in a speech at Bizerta, uses language offensive to England, Italy, and Germany.

September 17.—Secretary Hay addresses a note to the powers that are parties to the Berlin Treaty, urging that Roumania be compelled to ameliorate the condition of the Jews.

THE LATE GEN. FRANZ SIGEL.

OTHER OCCURRENCES OF THE MONTH.

August 21.—The White Star steamship *Cedric*, the largest ocean liner afloat, is launched at Belfast.... Natives are killed by earthquakes on the island of Mindanao, P. I.

August 22.—A severe eruption of Mont Pelée, Martinique, is reported.... Governor Taft is welcomed back to Manila with a great popular demonstration.... Mont Alto, in the southwest part of Italy, is in eruption, and earthquakes are felt near St. Petersburg, Russia.

August 25.—Harry De Windt, the explorer, completes the trip from Paris to New York overland, except for Bering Strait, in 248 days.... In the naval maneuvers off the New England coast, the "White Squadron" surrenders to the "Blue," after an ineffectual attempt to enter Salem Harbor and hold it against the opposing ships.

August 30.—The Sultan of Binadayan, Mindanao, held as a hostage by the American troops, is killed in an attempt to escape.... A violent eruption of Mont Pelée, Martinique, destroys the village of Morne Rouge; about one thousand lives are lost.

September 1.—The Propaganda at Rome decides to recommend the appointment of Bishop John M. Farley as successor to Archbishop Corrigan.... The British Trades Union Congress opens its annual session in London.

September 3.—President Roosevelt narrowly escapes

death from a trolley car running down his carriage near Pittsfield, Mass.; William Craig, of the Secret Service, whose duty it was to accompany the President, is killed.

September 4.—The bituminous coal strike in West Virginia is ended.... A terrific eruption of the Soufrière volcano is reported.

September 5.—The Pope confirms the choice of Bishop Farley to succeed Archbishop Corrigan, of New York.

September 6.—Charles R. Flint's steam yacht *Arrow* covers a measured nautical mile on the Hudson River in 92 seconds (see page 454).

September 8.—Earthquake shocks are felt in the Pyrenees and in India.... General Chaffee orders a vigorous campaign to be begun against hostile Moros on the island of Mindanao, P. I.

September 9.—The army maneuvers in Germany are begun.

September 10.—The British Association for the Advancement of Science meets at Belfast.

September 14.—McKinley memorial services are held in many American cities and towns.

September 17.—In the anthracite coal region of Pennsylvania, mines and washeries to the number of 57, producing 28,050 tons, are reported in operation.

September 18.—Lieutenant Peary arrives at Sydney, N. S., on his return from his Arctic voyage begun four years ago.

September 19.—In a stampede at a session of the National Negro Baptist Convention at Birmingham, Ala.,

more than one hundred persons are killed and many others seriously injured.... Captain Sverdrup, the Arctic explorer, returns to Norway on the steamer *Fram*, after a four years' voyage.... Stanley Spencer, the English aeronaut, sails his airship for thirty miles over the city of London.

OBITUARY.

August 21.—Gen. Franz Sigel, veteran of the German revolution of 1848-49 and of the American Civil War, 78.

August 22.—Sir Thomas Jamieson Boyd, ex-Lord Provost of Edinburgh, 84.... Rev. Dr. James K. Hazen, of Rich-

Photo by Rockwood.

THE LATE DR. THOMAS GALAUDET.

(Successful instructor of deaf-mutes.)

mond, Va., secretary of publication of the Southern Presbyterian General Assembly, 69.

August 23.—Peter S. Hoe, of Montclair, N. J., last surviving member of the original firm of R. Hoe & Co., printing press manufacturers, 81.

August 24.—Archduchess Marguerite Sophie of Austria, 82.

August 25.—John C. Bullitt, a prominent lawyer of Philadelphia, 78.

August 26.—Ex-Gov. George Hoadly, of Ohio, 76.... Col. William H. Hubbell, of Brooklyn, N. Y., com-

mander-in-chief of the National Order of Spanish War Veterans, 55.

August 27.—Rev. Dr. Thomas Gallaudet, prominent in work for deaf-mutes, 80....Sir Campbell Clarke, Paris correspondent of the *Daily Telegraph*, London, 67....Levi C. Bird, prominent lawyer and politician of Wilmington, Del., 60....Mrs. Charles S. Tingay ("Ada Gray"), actress, 68.

August 28.—George Douglas Brown, of London, author of "The House with the Green Shutters," 38....Levi Sprague, of Lowell, Mass., formerly president of the Erie Telephone & Telegraph Company, 92....William Ball, of Michigan, breeder of merino sheep, 70.

August 29.—Congressman Reese Calhoun De Grafenreid, of Texas, 43....Ex-Congressman William C. Cooper, of Mt. Vernon, Ohio, 71....Capt. Samuel Basse, prominent in Washington and Oregon politics for the last forty years, 71....Lyman P. White, the "Father of Brainerd," Minn., 91....James Doel, England's oldest actor, 98.

August 30.—Theodore F. Seward, of Orange, N. J., originator of "Don't Worry" clubs and Golden Rule Brotherhood, 87....Alfred D. Jones, of Omaha, said to have been Nebraska's first settler, 87.

August 31.—Gen. Tyree Bell, one of Forrest's brigade commanders in the Civil War, 87....John Trivett Nettleship, the English painter and author, 61....Ex-Judge Samuel Treat, of Missouri, 87.

September 2.—Rev. Dr. Edward Eggleston, clergyman and author, 65 (see page 448)....William F. Howe, the noted criminal lawyer of New York, 75....Judge Albert H. Horton, formerly chief justice of Kansas, 65....Edward Taylor Schenck, of Ithaca, N. Y., a well-known New York lawyer, 87.

September 3.—Lord Connemora (Rt. Hon. Robert Burke), who was twice Under-Secretary for Foreign Affairs in England, 75....Major Charles A. Smylie, of New York, president of the National Licorice Company, 44....Secret Service Agent William Craig, of President Roosevelt's bodyguard, 42.

September 5.—Prof. Rudolf Virchow, of Berlin, the noted pathologist (see page 425), 81

September 6.—Philip James Bailey, the English author, 86.

September 7.—Daniel Waggoner, the richest ranch owner in Texas, 76....Dr. Claudius Buchanan Web-

ster, the oldest living alumnus of Dartmouth College, 87....Ex-United States Senator William N. Roach, of North Dakota, 62....Miss Bertha M. Waters, of Glastonbury, Conn., one of the foremost painters of the American school in Paris, 26....Rev. C. F. Zimmerman, editor of the *German Evangelical Magazine*, 59....Sir Frederick Augustus Abel, former president of the British Association, 76.

September 8.—Ex-Congressman William Coleman Anderson, of Tennessee, 65.

September 9.—Dr. T. A. J. van Asch van Wyk, the Dutch Minister of the Colonies, 53....William Allen Butler, of Yonkers, N. Y., lawyer and author, 77....Rev. Dr. George C. Seibert, professor in the German Theological Seminary of Newark, N. J., 74.

September 10.—Jesse Cox, a prominent Chicago lawyer, 59....Wilson Guy, of Hampton, Va., who supervised the construction of the Confederate ram *Merri-mac*, 74.

September 12.—Ex-Gov. Alexander R. Shepherd, of the District of Columbia, 67....Ex-Chief Justice Charles B. Andrews, of Connecticut, 68....Rev. Dr. William C. Pierce, a pioneer Methodist minister of Western Reserve, 87.

September 13.—Gen. John H. Forney, of Jacksonville, Ala., who was a major-general in the Confederate army, 73....Col. William A. Rafferty, of the Fifth United States Cavalry, 60.

September 14.—William S. Stratton, the millionaire miner of Colorado Springs, Col., 54....Samuel D. Babcock, the New York financier, 81.

September 15.—Miss Mary Elizabeth Williams, of Salem, Mass., a noted artist, 77....Justice Horace Gray, of Massachusetts, who recently retired from the United States Supreme Court, 74....Col. William A. Banks, of Bryan, Texas, a veteran of the Civil War and prominent in educational work in the South, 59.

September 17.—Robert Bonner Bowles, comptroller of the currency in President Cleveland's second administration, 46.

September 18.—Peter Doerhoefer, the Louisville tobacco manufacturer, 86.

September 19.—Charles H. Latrobe, a noted civil engineer, of Baltimore, 69....Rev. Dr. John Stebbins Lee, first president of St. Lawrence University, Canton, N. Y., 82....Marie Henriette, Queen of the Belgians, 66.

## FORTHCOMING EVENTS.

THE following conventions have been announced for this month: American Missionary Association, at New London, Conn., on October 21-23; National Irrigation Congress, at Colorado Springs, Col., on October 6-9; National Encampment of the Grand Army of the Republic and affiliated societies, at Washington, on October 6-11; International Press Union, at Washington, on October 7; American Agricultural Colleges and Experiment Stations, at Atlanta, Ga., on October 7-10; Farmers' National Congress, at Macon, Ga., on October 7-10; National League of Republican Clubs, at Chicago, on October 2-3; Union Veteran Legion, at Chicago, on October 8-11; American Friends Conference, at Indianapolis, on October 21; Brotherhood of St. Andrew, at Boston, on October 9-12; United Irish League of

America, at Boston, on October 19-21; German Epworth League, at St. Louis, on October 16-19; Disciples of Christ, at Omaha, on October 16-23; Lake Mohonk Conference of Friends of the Indian, at Lake Mohonk, N. Y., on October 22-24; American Society of Municipal Improvement, at Rochester, N. Y., on October 7-9; Methodist Missionary Conference of the World, at Cleveland, Ohio, on October 21-24; National Household Economic Association, at Milwaukee, on October 22-24; American Board of Commissioners for Foreign Missions, at Oberlin, on October 14-17; International Horticultural Congress, at New York City, on September 30-October 2; the American Humane Association, at Albany, N. Y., on October 15-17; and the National League of Republican Clubs, at Chicago, on October 2.

## CURRENT POLITICS IN CARTOONS.

"LEST WE FORGET."—From the *World* (New York), September 14, 1902.

**T**HE cartoon that we reproduce above, from a drawing by Mr. Charles G. Bush, appeared in the *New York World* last month on the first anniversary of the death of President McKinley. The Republican party would do well if it took this quotation from Mr. McKinley's last speech as one of its principal mottoes in the present campaign. The country unmistakably demands some modification of the existing tariff sys-

tem. Mr. McKinley a year ago declared that the time had come for changed trade relations with other countries, and that reciprocity, rather than free trade, ought to be the Republican method of recognizing the fact that our industries have outgrown the period of infancy, and can more than supply the home market. The cartoons that follow are mostly devoted to topics of interest in the current political discussions.

THE HANDWRITING ON THE BAND WAGON.—From the *Herald* (New York).

A GLIMPSE INTO THE FUTURE.—FAST AND TIGHT.

PRACTICING THE PARTY SLOGANS FOR THE FALL CAMPAIGN.  
From the *North American* (Philadelphia).

OH, NO, WE ARE NOT CANDIDATES,—  
WE'RE LOOKING AROUND FOR FUN;  
THERE'S PLENTY OF TIME TO CHANGE OUR MINDS  
IF WE CONCLUDE TO RUN.

From the *Plain Dealer* (Cleveland).

"Yes, the Democratic nomination for President will probably fall between Dave Hill and Bryan."  
From the Journal (Minneapolis).

ONLY HIS NEIGHBORS FAIL TO PATRONIZE UNCLE SAM'S BIG STORE.  
From the *North American* (Philadelphia).

Mr. Nelan's cartoon at the top of this page is meant to have a bearing upon current criticism of the fact that under existing tariff protection our large American industrial interests sell much more cheaply in foreign markets than here at home. The real question, of course, is whether, if the tariff wall were battered down, our home manufactures would not suffer so much as to make wage reduction necessary in order to carry on business in competition with foreigners. Mr. Bowman, of the *Minneapolis Tribune*, has a very humorous cartoon apropos of certain speeches in which the Secretary of the Treasury has attempted to

deny that the trusts have been principally fostered by the tariff. Mr. Bartholomew, of the *Minneapolis Journal*, makes a cheerful defense of the young Cuban republic in proposing to treat us as we have been treating her in the matter of tariff exclusiveness. It will be a good thing for all concerned when our tariff fence is extended to include the long-suffering island.

**THE TRUSTS:** "Mamma! mamma! There's my mamma!"  
**SECRETARY SHAW:** "My dear child, you have no mother. You just grew!"—From the *Tribune* (Minneapolis).

FOLLOWING AN ILLUSTRIOUS EXAMPLE.

**UNCLE SAM:** "You young rascal! What are you up to?"  
**CUBA:** "I'm just a-buildin' a high-tariff fence like yours."

From the *Journal* (Minneapolis).

OUR MUTUAL FRIEND.

**MISS CANADA** (to her guardian, Sir Wilfrid Laurier, on his return from England and France): "So you've seen my two grandmothers; how do you like them?"

**SIR WILFRID:** "Well, my dear, they are both so charming that I'm surprised they don't know one another better."

# THE UNITED STATES AND MEXICO AT THE OPENING OF THE HAGUE COURT.

BY W. T. STEAD.

ON September 15, the first case which has been referred for adjudication to the Hague Court was opened. The event, which will probably be remembered in history long after all the other items of intelligence which fill the newspapers at the present moment are forgotten, was marked by no ceremonial. The question at issue that has to be decided is comparatively small, and the dispute which will be settled this month would be speedily forgotten by all mortal men were it not that it will be remembered in the history of the human race that it was for the settlement of such a dispute that the first court under the Hague Convention was opened in the capital of the Netherlands.

There is a strange fitness in things. For three years, since the Conference of Peace broke up, no use whatever has been made of the convention drawn up by that parliament of peace for the amicable settlement of international disputes. For that delay the British Government must bear the whole responsibility. The supercilious refusal by English ministers to accept the plaintive and oft-repeated entreaty of President Krüger to settle their dispute with the South African republic on the lines of the Hague Convention administered a blow to the cause of arbitration the full extent of which is very imperfectly realized.

It would have mattered little if war had been entered upon by some other power than England, say, for instance, by one of the powers which acquiesced reluctantly, and under what may be regarded as moral duress, in the framing of the arbitration convention; but that England, who, through her distinguished representative Lord Pauncefote, had taken the lead in affirming the principle of arbitration before the world, should have been the first power to trample the principle under foot the moment she thought that she could attain her ends by a cheap and easy war, gave courage to all the enemies of arbitration to heap ridicule upon the principle which they had reluctantly accepted, and to do their utmost to bring the court at The Hague into ridicule and contempt. It is an open secret that some, at least, of the governments who signed the convention under the constraining influence of the Czar's prestige and popular enthusiasm for the

M. DE MARTENS OF RUSSIA.

(The world's greatest international lawyer and one of the arbitrators for the United States.)

cause would be very glad if the Hague Court were dissolved.

There was also a natural reluctance even on the part of some governments which were not so hostile to the cause of arbitration to be the first to call the court into active existence. Now, however, the war being over, it is extremely satisfactory to know not only that the court is to sit to adjudicate an international dispute, but that the initiative should be taken by the United States of America. The new world is the first to take advantage of the new court established by the parliament of peace for the settlement of the disputes of the nations.

It is also good that the dispute should be one between two republics. In this respect republics are setting an example, for it is always well for republics to set an example to monarchies.

The first question which is brought before the court,—although in itself a mere trifle concerning the ownership of a capital sum of something over \$700,000,—is one which possesses an historical and religious significance of the first rank.

#### HISTORY OF THE PRESENT CASE.

The Church having failed to perform its manifest duty of acting as peacemaker and arbiter of the disputes of the world, the laymen have at last, after the lapse of many centuries, taken the task into their own hands, and the Hague Tribunal is the work of laymen. It is constituted by temporal governments, from whose deliberations the spiritual power was sedulously shut out. But what is the first question that is to be brought before this lay tribunal, constituted by secular governments for the settlement of international disputes? It is a question of ownership of property which was originally given by pious founders for the extension of the Catholic Church. The matter in dispute, stripped from all question of encumbering detail, amounts to this: When the frontier of Mexico stretched northward, so as to include the whole of the present State of California, certain sums of money were given to the Society of Jesus for the purpose of carrying on its operations in California. Toward the close of the eighteenth century the then Pope suppressed the Jesuits, and the society, being driven out of Mexico by the faithful Catholic government of that date, lost control of its possessions, the administration of which was then undertaken by the Mexican Government.

After passing through various changes of the methods of administration, the Mexican Government undertook to appropriate the Jesuit funds and pay 6 per cent. interest on their capital value to the administration of the Catholic Church in those regions where the property lay. In 1846,

M. ASSER OF HOLLAND  
(One of the arbitrators for Mexico.)

Mexico and the United States went to war; and the northern part of California passed by conquest to the American Government. The Mexican Government claimed that the annual 6 per cent. interest which it owed to the Catholic Church should be paid to the Catholic Church in its own curtailed dominions. The United States Government claimed, on the other hand, that the Catholic body in the ceded Mexican territory, now the State of California, was entitled to its proper share in the original endowment.

From the year 1848 down to the year 1868 the dispute went on, without any settlement having been arrived at, but in 1868 the question whether the Mexican Government ought to disgorge the proper proportion of the original funds for the benefit of the Catholic Church in the State of California was referred to arbitration by a mixed commission. Sir Edward Thornton, then British ambassador at Washington, was selected as the arbitrator; and in the year 1869 he gave his award, which was to the effect that in justice and equity the State of California was entitled to half of the original bequest, and he decided that the Mexican Government must pay over to the American Government the arrears of twenty-one years of interest upon half of the property in question. This they did, but since

1869 they have refused to pay a penny more, and have appropriated the whole of the annual interest to the Catholic Church in the republic of Mexico. For thirty-three years this has been a source of dispute between Washington and Mexico, and it is this question which is now to be referred to the Hague Court for decision.

The capital sum involves about \$715,000. The Americans plead that Sir Edward Thornton's award settled once for all the justice of their claim to this sum, which is one-half of the total value of the property originally left to the Jesuits. The Mexicans, on the other hand, deny that Sir Edward Thornton's award bound them in the future. It dealt only with the question of the arrears up to 1869. The Americans contend that by Sir Edward Thornton's award the question became what is technically called *res judicata*. This is denied by Mexico on various grounds.

#### THE PRECISE POINTS AT ISSUE.

The first question, therefore, that the Hague Tribunal will have to decide is whether Sir Edward Thornton's decision was final as to the proper distribution of the original Jesuit fund, or whether it was not. If the Tribunal finds that the arbitral decision of 1869 ought to be as

binding in international law as it would be in common law, then the question will be settled without any necessity for going into the merits of the case. If, however, they should decide otherwise, the Hague Court will have to deal with the whole matter, and all manner of interesting questions will come up for decision. Among these, one of the most interesting is whether the funds originally left by pious founders to the Jesuit order were left to them for a political purpose or solely for the purpose of religious propaganda; and another question is whether the present Catholic Church in California is the legal successor of the Catholic Church which existed under the Catholic government.

The precise terms of reference are embodied in a protocol of an agreement made between the two governments of the United States and the republic of Mexico, "for the adjustment of certain contentions arising under what is known as the Pious Fund of the Californias," which was signed at Washington on May 22, 1902. This protocol, after a recital of the fact that the subject was submitted to a mixed commission in accordance with a convention dated July 4, 1868, and that the commission adjudicated the question at issue adversely to the republic of Mexico, and made an award of twenty one years' interest, amounting altogether to the sum of \$904,700, which sum had been fully paid and discharged in accordance with the terms of the said convention, proceeds as follows:

SIR EDWARD FRY OF ENGLAND.

(One of the arbitrators for the United States.)

Whereas, the United States of America, on behalf of said Roman Catholic bishops, above named, and their successors in title and interest, have since such award claimed from Mexico further installment of such interest, and have insisted that the said claim was conclusively established, and its amount fixed as against Mexico, and in favor of said original claimants and their successors in title and interest under the said first-mentioned convention of 1868 by force of the said award as *res judicata*; and have further contended that apart from such former award their claim against Mexico was just, both of which propositions are controverted and denied by the republic of Mexico, and the high contracting parties hereto, animated by a strong desire that the dispute so arising may be amicably, satisfactorily, and justly settled, have agreed to submit said controversy to the determination of arbitrators, who shall, unless otherwise herein expressed, be controlled by the provisions of the international convention for the pacific settlement of international disputes, commonly known as the Hague Convention, and which arbitration shall have power to determine:

1. If said claim, as a consequence of the former decision, is within the governing principle of *res judicata*; and

2. If not, whether the same be just.

And to render such judgment or award as may be meet and proper under all the circumstances of the case.

These contentions, the protocol proceeds to state, are to be referred to the special tribunal constituted in accordance with the provisions of the Hague Convention, the first meeting of which for the selection of an umpire was to take place on September 1, while the commencement of the hearing was fixed for September 15. All arguments, statements of fact, and documents should be concluded within thirty days after that date, unless the court decided upon a further extension of time not to exceed thirty days. Whatever sum is awarded by the tribunal must be paid within eight months of the date of award. Each of the parties shall pay its own expenses, and one-half of the expenses of the arbitration, including the pay of the arbitrators. If either party is dissatisfied with the award, revision is permitted, if a demand for such revision is made within eight days after its announcement. The question whether revision shall or shall not be allowed must be settled within five days after it is demanded, and within ten days proofs must be submitted, and counter-proofs within a further period of ten days. Arguments must be submitted within ten days after the presentation of all proofs, and a judgment or award given within ten days thereof.

If the court does not decide upon any extension of time the award may be expected on October 15, and if no demand for revision is made by October 23, the award will be final and conclusive as to the matters presented for arbitration. If, however, matters do not go so expeditiously, that is to say, if the court allows a further period of thirty days, and if revision is claimed and granted, the award may not be given until November 15, after which revision may postpone the final decision until January 7, 1903.

#### MEXICO'S CONTENTIONS.

By a reference to the diplomatic negotiations which preceded this reference to arbitration it is possible to forecast the nature of the arguments which will be adduced before the tribunal at The Hague. Mr. Mariscal, the Secretary of State of the Mexican Republic, at first put forward the plea that the matter was not one for diplomatic intervention, but should be tried before the courts of Mexico. This contention was afterward abandoned by the Mexican Government, and need not be considered here. The second objection raised by the Mexican Secretary of State deals with the question whether or not the decision of the mixed commission of 1868 constitutes a definite decision as to the question in dispute. Mr. Mariscal concedes the principle of the *res judicata* as governing the decisions of tribunals created for international arbitration. But he maintained that the

award of 1868 was not conclusive in the present case for two reasons :

A. Because in deciding the case submitted to the mixed commission of 1868, that tribunal exceeded its jurisdiction, inasmuch as the claim put forward was not one of the class agreed to be submitted by the convention in question.

B. Because the establishment of the amount of interest annually accruing in the case, and payable under the decree of October 24, 1842, is not any portion of what Mr. Mariscal terms the decisory part of the award, and that hence the principle of *res judicata*, etc., does not apply.

To the first of these objections the American reply is conclusive. If the commission of 1868 pronounced judgment on a claim which was not one of the class agreed to be submitted by the convention in question, the Mexican Government ought to have taken this objection at the time. The Geneva Tribunal upon the Alabama claims had insisted upon taking indirect claims into consideration. But when the indirect claims were brought forward by the United States Government the British Government at once declared that it did not regard such claims as embraced within the submission to the tribunal. But Mexico did not follow the British example. She deliberately argued and submitted the question whether the claim came within the terms of the convention before the arbitral tribunal created by it. The decision was against her, and she complied with and acquiesced in the award. In accepting the award Mexico necessarily accepted it with all its consequences.

As to the second objection, that the establishment of the amount of interest annually accruing is not any portion of the decisory award, and hence the principle of *res judicata* does not apply to it, the American Government meets this by a direct contradiction. The fixing of the amount of interest annually accruing was in their opinion a decisive part of the award, and carried with it logically a recognition of the justice of the claim of the American Government for the payment of such interest for each year that has passed since the award. The Mexican Government makes a further objection of another kind. They maintain that the Catholic Church of California to-day is not the legal successor of the Catholic Church which existed in California under the Mexican Government, and derives no title from it. If such a contention were admitted, it is contended on behalf of the United States that it would destroy the identity of the cities of San Francisco, San Jose, Santa Cruz, and Los Angeles, with the Mexican pueblos to which they succeeded respectively, and in virtue of which succession they enjoyed large and valu-

M. SAVORNIN LOMAN OF HOLLAND.  
(One of the arbitrators for Mexico.)

able properties. Such destructive effect of a change of sovereignty has never been recognized in any system of jurisprudence. This question was argued before and passed upon by the commission of 1868. Roman Catholic citizens of California, Nevada, Utah, Oregon, Washington, Idaho, and Montana are all interested in this matter, because the Territories which they reside in were embraced within the benevolent intentions of the founders, which were coextensive with the claims of the Spanish monarchy to temporal dominion.

Should the Hague Tribunal decide that the matter is *res judicata*,—or, to use the words with which the Dreyfus trial made us all familiar, *à chose jugée*,—the question will cease and determine. If, however, they should go into the question on its merits, it is possible that they might make a decision of policy rather than of law, and provide for either a reduction of the rate of interest,—for 6 per cent. is rather heavy according to modern standards,—or they might suggest that all future claims should be extinguished by a voluntary payment of the whole capital sum in dispute by the republic of Mexico to the United States. This, however, is to stray into regions of speculation which may have become out of date by the time this paper is printed.

Apart from the technical legal question, is it possible to conceive of a more interesting question, or one which more strikingly illustrates the shifting of authority from the ecclesiastical to the temporal power?

#### PERSONNEL OF THE COURT.

The question would never have arisen if it had not been for the action of the Pope in suppressing the Jesuit order at the end of the eighteenth century. The whole dispute turns upon whether a certain sum of money shall or shall not be allocated to the use of certain Catholic communities in the State of California, or whether it shall be devoted entirely to the use of Catholic communities in the republic of Mexico. Yet this question, which would seem to be eminently one for the decision of an ecclesiastical court, is raised by diplomatic action between two governments, one of which is freethinking and the other Protestant, and its decision is referred to a court primarily consisting of four arbitrators, one of whom, M. de Martens, is a Greek-Orthodox; another, Sir Edward Fry, is an English Prot-

ARCHBISHOP RIORDAN, OF SAN FRANCISCO.  
(Now at The Hague in support of the American case.)

estant; a third, M. Asser, is a Jew; and the fourth, M. Savornin Loman, is a Dutch Protestant. Should these four arbitrators be unable to agree, the question will be referred to an umpire, whom the four,—who are respectively Greek-Orthodox, Jew, and Protestant,—agree among themselves to nominate. Should they decide that the question is not a *res judicata*, this heretical court will have to decide, among other things, whether moneys left to the Society of Jesus in the eighteenth century were given for political or for religious purposes, and whether the Catholic Church in English-speaking California is the same Catholic Church as existed there when it was ruled by Mexico. Yet, in the opinion of the Catholics themselves, it would be difficult, if not impossible, to secure a tribunal more certain to decide the case upon its merits.

Of M. de Martens, who was the first of the arbitrators named by the American Government, it is impossible to speak too highly. Long ago I gave him the *sobriquet* of "the Chief Justice of Christendom," on account of the honorable part which he has taken in almost every important arbitration of recent times. Sir Edward Fry is one of the ornaments of the English judicial bench—a man eminently fair, open-minded, and free from any of the bias of the partisan. M. Savornin Loman, former Minister of Justice of the Netherlands Government, is one of the most distinguished lawyers in Holland. M. Asser, who was appointed at the eleventh hour in place of the Italian who was originally nominated, but who was unable to take his seat owing to the unexpected death of his wife, is one of the most eminent and judicially minded of all the members of the Hague Conference. He was the arbitrator selected by the Russian and American governments in an arbitration the award of which is not yet published. The case of Mexico will be pleaded before the court by no less distinguished a counsel than M. Beernaert, who is himself one of the judges of the International Court, and who is, beyond question, much the most eminent living Belgian. The arbitrators met on September 1 for the purpose of nominating an umpire, and chose for that office Dr. H. Matzen, president of the Danish Landsthing. The formal pleading was begun on September 15, and the decision will have to be given in thirty days. The proceedings, therefore, will naturally be watched very closely by all those who are interested in the cause of international arbitration, and there is every reason to anticipate a satisfactory and final decision of a dispute which in one form or another has created friction between two American governments for fifty-four years.

I had the pleasure of visiting The Hague in

August, and saw for the first time the premises which had been secured for the use of the court. It is a building in the Prinzengracht, fronting on a canal, which is shortly to be drained, and the space now occupied by the canal converted into a broad esplanade. The premises are taken on a five years' lease, at the remarkably low rent of \$500 a year. The house does not stand by itself, but has a prettily laid out garden in the rear. It has been fitted up for the use of the court, and on the walls are hung portraits of the sovereigns, prime ministers, and plenipotentiaries who took part in the founding of the court. The room where the council meets for the purpose of auditing the accounts and superintending the operation of the bureau is furnished with chairs, each of which bears the name and the arms of the power for the use of whose diplomatic representative it is. Another room is set apart for the library, for the replenishing of whose shelves the modest sum of \$200 a year is allocated by the economical council. Besides the court room in which the court will sit to adjudicate upon disputes brought before it, there are also retiring rooms, secretaries' rooms, and other necessary accommodation. The bureau as an office is commodious, supposing that arbitrations are occasional; but if the practice became general of referring disputes to the adjudication of the Hague Tribunal, it is quite evident that the present premises will be insufficient and inconvenient. But the prudent Dutch Government and the somewhat skeptical members of the council decided to proceed tentatively, and so they have provided for the headquarters of the tribunal modest premises which can be procured at a minimum cost, but are in singular contrast to the hopes entertained by those who founded the Hague Tribunal. It was perhaps well to walk before we ran, and it is better to begin on a small scale at first, rather than to launch out on a great expenditure such as would certainly be required for the Supreme Court of Nations.

Much will, of course, depend upon the result of the first arbitration. If it passes off well, and is rapidly followed by other appeals to the same tribunal, we may anticipate that quarters more in keeping with the importance of the court and in a more convenient location will be obtained, and that the new premises will be furnished and equipped with the best library of international law to be found anywhere in the world. The need for such a court, and the need for strengthening the court which has already been established, so as to enable it to take note of infractions of the conventions drawn up at the conference, is obvious to all who take an interest in such questions.

# RUDOLF VIRCHOW, EXPONENT OF THE DEMOCRACY OF LEARNING.

## I.—THE CAREER OF GERMANY'S GRAND OLD MAN OF SCIENCE.

BY OSWALD GARRISON VILLARD.

THERE died in Berlin, on September 5, one whose claim to immortality rests upon the surest foundation,—upon inestimable services to mankind, through his contributions to the science of healing and to knowledge of the human body. Of the names that are bound to live, Napoleon's will always be at one extreme of the list and Rudolf Virchow's at the other. For, above all else, Virchow was a lover of peace, an advocate of disarmament, a believer in the sacredness of human life, an enemy to wars, which he thought the source of most evils of the state, and a man whose whole life was given to increasing the knowledge and skill of physician and surgeon, that the average human existence might be prolonged, and death defeated at bed-sides where death had triumphed ever since the memory of man.

Yet, though it must ever be recorded that the practice of medicine owes its elevation from a trade to a science to him more than to all the rest of the medical discoverers of the twentieth century, it would be more accurate to say that he gave one of his lives to the art of healing. Not without reason did the Berlin public declare that when this little scientist died he would be found to be four men, and not one. Many a man has attained an honored place among writers and scientists by contributions no more valuable or extensive than those which came from Virchow's pen about Egyptology and archæology. Learned men have been honored by universities, the great scientific societies, even by nations, for less useful achievements than Virchow's determination of the measurements for comparative anthropology and his collections of race data which made him at once a pioneer and a leader in ethnology. Almost any ambitious teacher and investigator in any field of science would estimate his activity in terms of greatness could he leave behind him one-third the original contributions to knowledge which bear Virchow's name upon their title pages. But, in addition to all this, it was given to Virchow, throughout his four-score years, to be a great citizen and a great commoner. If he proved, as one medical writer has put it, the blood relationship of medical scientists to investigators in every other field of science, he also

made plain beyond dispute, in his own person, the kinship of politics and science, and demonstrated that he who wields the "Pathologist's Sword" can still find time for the duties of a public career as well as those of every-day citizenship.

In the domain of scientific learning is the truest democracy. Citizenship in it is citizenship in a world where there are neither artificial boundaries nor race jealousies. When urged, in the early seventies, to resign from the French scientific societies, Virchow indignantly refused. It was as much of a duty and a pleasure with him to dilate on Russian advances in caring for the public health, or to tell English and Italian scientific men what they owed to their own early investigators, like Glisson and Morgagni, as it was to praise his own countrymen and their achievements. None of the great honors and distinctions showered upon him could ever shake or affect his supreme modesty. This was ever strengthened by his chastening belief that where one's actual achievement falls so far behind one's goal and aims there is no room for pride. A born democrat and a liberal, this belief, as well as his scientific training, made him always one of the people. Indeed, he first attracted public attention and first won the distrust of royalty by his report upon the typhus epidemic of 1848 among the poor weavers in Silesia. Then still a young and unknown physician, his whole soul was stirred by the poverty, the overcrowding, the starvation, among those who were not only fellow countrymen, but fellow men and women. He denounced their condition, and the government that was responsible for them, in the strongest terms. From that moment he was a marked man; from that moment dated his enlistment in the cause of humanity.

Born in Schivelbein, near Stettin, in Pomerania, of middle-class parents, his life up to that time had in no way suggested the brilliant and superlatively useful career before him. He had left the gymnasium at seventeen, and had gone at once to Berlin to study medicine. On getting his degree as *Unterarzt*, in 1843, he had been made pro-sector at the Charité Hospital; and, in 1847, external lecturer in pathology at the Uni-

THE LATE PROF. RUDOLF VIRCHOW.

versity of Berlin. But the outspokenness of his report on the Silesian weavers, as well as his adherence to the Liberal movement which convulsed Germany in 1848 and 1849, temporarily terminated his career in Berlin, and led to his expulsion from his position. The South German University of Würzburg was, however, quick to perceive his value, and gave him its chair of pathology, rightly ignoring, if it did not sympathize with, his devotion to the cause of the people.

Here Virchow reconquered his Berlin position, and rose to lasting fame by the publication, in 1856, of his work entitled "Cellular Pathology." Pathology has been defined as "the science of disease, or of life under morbid conditions." Before Virchow devoted his master mind to them little or nothing was known as to the pro-

cesses which actually constitute disease. Medical men treated their patients, not with any knowledge of the conditions which had led up to illness, but merely tried the effects of drugs upon the symptoms that presented themselves without regard to the causes of which the symptoms were the result. Virchow proved that the cell is the unit of life in the healthy or unhealthy body, and that every cell is the outgrowth of another cell. It was his theory that the most abnormal cellular conditions are the results of injurious agencies at work on normal cells. Other great minds had already progressed considerably in this direction, among them Schwann, Müller, and Paget, but to Virchow must be given the credit for completing the theory and presenting it as a whole, so that it could be grasped by the entire medical world,

and became the basis of all medical theory. The study of bacteriology was an immediate consequence, although it seemed at first in conflict with Virchow's theory, and out of bacteriology have grown antiseptic surgery and the other marvelous developments of our modern operative science.

From the time of his resumption of his Berlin chair, Virchow's literary and scientific activity was incessant. Until his final illness he never ceased to work and teach. Continuing the publication of his "Archives of Pathological Anatomy and Physiology and of Clinical Medicine," which he had founded in 1847, and which are now, for the first time, without his supervision, Virchow wrote upon widely ranging topics. Physiology, public and school hygiene, epidemics and endemics, hospitals,—civil and military,—criminal law, military medicine, the cleaning of cities, the reform of medicine—these are some of the general medical heads under which he wrote. Upon the inflammation of blood vessels, the formation of the human skull and the cerebral substances, on swellings, tumors, embolisms, tuberculosis, diphtheria, and many other subjects he used the pen and displayed the knowledge of the specialist. "Goethe as a Naturalist," "Annual Reports of Advances in Medicine Throughout the World," "The Graves of Koban," and many valuable archaeological works might almost be said to have been the pastime and recreations of his intellect, which frequently gave nineteen hours out of the twenty-four to intense mental labor. In the interest of his friend Schliemann, the discoverer of Troy, he found time to travel in Nubia, Egypt, and the Peloponnesus, and no one ever hinted that in these side issues any trace of the amateur was to be found either in his writings or in his historical deductions. If a jack of many trades, he was essentially and absolutely master of them all. And it goes without saying that a mind like this was not contented until it had assimilated one after another of the living languages.

Throughout all this wondrously busy career he was not only the teacher of medical students from all over the world, who gathered in his lecture room to see the extraordinary skill with which he used his knife, but also the instructor of the public at large. For years he taught for the Berlin Association of Artisans, in what might now be called a "University Extension" movement, and put all his heart into the work of spreading a knowledge of science among the poor and the great middle classes. He never had a qualm as to the results of imparting education to the masses, nor feared that little knowledge which a catching phrase has made a "dangerous thing." Truth was for him ever the goal

to be sought, the god to be worshipped, and there were none to whom he was not willing to carry the facts which science and his own creative ability had brought to light. As if this were not proof enough of his readiness to serve the people, he brought about the construction of one hospital and one museum after another, through his own initiative or the support which his unrivaled prestige enabled him to give to others. Even Berlin's transformation from an exceptionally unhealthy to a notably healthy city is laid at his door.

#### VIRCHOW'S GREAT SERVICES TO THE STATE.

All this would alone have marked his devotion to the common weal and would have made him as one apart among his brothers in learning, for men like Helmholtz, Darwin, and Pasteur were content with the laboratory and its rewards. Not so Virchow. The highest kind of patriotism, the most conscientious pride in the civic life of which he was a part, impelled him to take office. How he found time to be a conscientious legislator, and even to be a partaker in the social life of the capital, it is impossible to explain. But the fact remains that he was for forty-two years one of Berlin's most faithful city councillors. Moreover, this did not satisfy his desire to serve his state, and in 1862 no fewer than three constituencies elected him to the Prussian Chamber, in which he served for sixteen years, and speedily rose to be the leader of the Liberal party by sheer ability and undaunted political courage. After city and state there was still the empire, however, and in its popular governing body, the Reichstag, Virchow served from 1880 to 1893, until turned out by the ungrateful Social Democrats.

It was in the Prussian Chamber that he rendered his greatest legislative services. Never an orator, his speeches were clear, forcible, and marked by intense earnestness, and as such they always attracted attention. Bismarck found it necessary to cross swords with him time and again. So natural and so outspoken a radical was naturally a red flag to the wonderful but unscrupulous Chancellor. How could the bureaucracy or aristocracy admire a man who would have his countrymen ground arms whatever the nation's perils? How could they admire one who again and again arraigned the Prussian ministry as he had arraigned it on his return from Silesia? How could the blood-and-iron patriots else than abhor one who, in 1865, defeated the attempt to create a German navy? Or who had, in 1863, forced the Chamber to pass a resolution condemning the government? His success in the latter matter so irritated Bismarck as to

lead him to challenge the undersized, spectacled professor to a duel, which was fortunately prevented, but the threat of which did not induce Virchow to soften his language, often described as violent and smacking of the demagogue by those who felt the lash of his tongue. Nor did his being deprived of the rectorate of the University of Berlin, in 1887, for a period of five years, affect his championship of what he considered the right. So great a man was above both the rewards and punishments of offended royalty. In the wars of 1866 and of 1870-71 he proved to his political opponents that he possessed the cheaper patriotism by conducting the first ambulance trains into the hostile territories, and devoting to the Red Cross work his extraordinary talent for organization. And all the while, if there was a hospital to be built, a new quarter to be laid out, the police to be reorganized, the drainage to be improved, the water supply to be increased, or the public health to be better safeguarded, it was always to Virchow that the magistrates of Berlin went seeking inspiration and the advice which always determined the action to be taken. Is it any wonder that the city has named its newest hospital after him, or that it buried him at its own expense as its most distinguished citizen?

Wherever placed, with whom he might come in contact, whether delivering the Huxley or Royal Society lectures in England, or showing a couple of Americans through the Berlin Eth-

nological Museum, or bowing before royalty, this king of science was ever a simple little gray man, "sincere, kindly, unassuming, absorbed in his subject, not in himself, crammed with information, profound and penetrating in thought, plain in utterance, the embodiment of accurate knowledge and sound judgment, the true servant of the truth."

Lord Lister, to whom antiseptics owes so much if not all, speaking as mouthpiece of England's learned societies at Virchow's wonderful eightieth birthday celebration in Berlin, on October 13, 1901 (like his seventieth, an event in the scientific world which drew its devotees from all quarters to the home of the Berlin savant), said: "All these bodies join in the recognition of your gigantic intellectual powers, in gratitude for the great benefits which you have conferred on humanity, and in admiration of your personal character, your absolute uprightness, the courage which has enabled you always to advocate what you believed to be the cause of truth, liberty, and justice, and the genial nature which has won for you the love of all who know you."

Few men have ever lived to have such homage paid and such praise bestowed upon them. None have found the applause of the multitude, the praise of the discerning, or the gifts of kings, of slighter moment, when compared with the satisfaction of high attainment or of ceaseless services on behalf of humankind.

## II.—VIRCHOW THE TEACHER.

BY DR. HENRY SMITH WILLIAMS.

IT seemed as if one encountered Virchow in whatever direction one turned in Berlin, and one felt that it was not without reason that his compatriots spoke of him as "the man who knows everything." At seventy-seven years he still had all the alertness of intellect and the energy of body that made him what he was. One found him at an early hour in the morning attending to the routine of his hospital duties, his lectures, and his clinical demonstrations. These finished, he rushed off, perhaps, to his parliamentary duties: thence to a meeting of the Academy of Science, or to preside at the Academy of Medicine or at some other scientific gathering. And in intervals of these diversified pursuits he was besieged by a host of private callers, who sought his opinion, his advice, his influence, in some matter of practical politics, of statecraft, or of science: or who, perhaps, merely came the length of the Continent that they might grasp the hand of the "Father of Pathology."

In whatever capacity one sought him out, provided the seeking was not too presumptuous, one was sure to find the great savant approachable, courteous, even cordial. A man of multifarious affairs, he impressed one as having abundance of time for them all, and to spare. There is a seeming leisureliness about the habits of existence on the Continent that does not obtain in America, and one felt the flavor of it quite as much in the presence of this great worker as among those people who, from our standpoint, seem never ready to work at all. This was to a certain extent explained if one visited Virchow in his home, and found, to his astonishment, the world-renowned physician, statesman, pathologist, and anthropologist domiciled in a little apartment of modest equipment, up two flights, in a house of the most unpretentious character. It was entirely respectable, altogether comfortable, to be sure—but it was a grade of living which a man of corresponding position in America could

PROFESSOR VIRCHOW LECTURING TO A CLASS.

(Drawn by E. H. Williams, during a visit with the great scientist.)

not hold to without finding himself quite out of step with his *confrères* and the subject of unpleasant comment. But here, in this city of universal apartment-house occupancy and relatively low average of display in living, it was quite otherwise. Virchow lived on the same plane, generally speaking, with the other scientists of Europe; it was only from the American standpoint that

there was any seeming disparity between his fame and his material station in life; nor do I claim this as a merit of the American standpoint.

Be that as it may, however, our present concern lies not with these matters, but with Virchow the pathologist and teacher. To see the great scientist at his best in this rôle, one should have visited the Institute of Pathology on a Thursday morning, at the hour of nine, as the writer did when last in Berlin. The institute building itself is situated close to the great Charité Hospital, and faces the series of low, unpretending structures which make up the famous bacteriological laboratories of Professor Koch. Virchow's institute is large by comparison with these, yet it also is distinctly unpretentious, not to say antiquated and shabby. For the moment, as in the past, it serves an excellent purpose, but it is about to be replaced by a new and more commodious building; indeed, it is possible that the change may have been effected within the past two years.

As we entered the lecture hall on the occasion referred to, we found the students already assembled and gathered in clusters all about the room, examining specimens of morbid anatomy, under guidance of various laboratory assistants. This was to give them a general familiarity with the appearances of disease products to be described to them in the ensuing lecture.

But what was most striking about the room was the unique method of arrangement of the desk or table on which the specimens rested. It was virtually a long-drawn-out series of desks winding back and forth throughout the entire room, but all united into one, so that a specimen passing along the table from end to end would make a zigzag tour of the room, pass,

VIRCHOW'S BIRTHPLACE.  
(In the village of Schivelbein.)

ing finally before each person in the entire audience. To facilitate such transit there was a little iron railway all along the center of the table, with miniature turntables at the corners, along which microscopes, with adjusted specimens for examination, could be conveyed without danger of maladjustment or injury. This may seem a small detail, but it was really an important auxiliary in the teaching by demonstration with specimens for which this room was peculiarly intended. The purely theoretical lectures of Professor Virchow were held in a neighboring amphitheater of conventional type.

Of a sudden there was a hum in the hush of voices as a little, thin, frail-looking man entered and stepped briskly to the front of the room and upon the low platform before the blackboard in the corner. A moment's pause for the students to take their places, and the lecturer, who, of course, was Virchow himself, began, in a clear, conversational voice, to discourse on the topic of the day,—which chanced to be the subject of the formation of clots in blood vessels. There was no particular attempt at oratory. Rather the lecturer proceeded as if talking man to man, with no thought but to make his meaning perfectly clear. He began at once putting specimens in circulation, as supplied on his demand by his assistants from a rather gruesome-looking collection

before him. Now he paused to chaff the assistant who was making the labels, poking good-natured fun at his awkwardness, but with no trace of sting. Now he became animated, his voice raised a little, his speech more vehement, as he advanced his own views on some contested theory, or refuted the objections that some opponent had urged against him, always, however, with a smile lurking about his eyes or openly showing on his lips.

Constantly the lecturer turned to the blackboard to illustrate with colored crayons such points of his discourse as the actual specimens in circulation might have left obscure. Everything had to be made plain to every hearer, or he was not satisfied. One can but contrast such teaching as this with the lectures of the average German professor, who seems not to concern himself in the least as to whether anything is understood by any one. But Virchow had the spirit of the true teacher. He had the air of loving his task, old story though it was to him. Most of his auditors were mere students, yet he appealed to them as earnestly as if they had been associates and equals. He seemed determined that his phraseology should gauge the level of their comprehension. Physically he was near to them as he talked, the platform on which he stood being but a few inches in height, and such physical nearness conduces to a familiarity of discourse that is best fitted for placing lecturer and hearers *en rapport*. All in all, appealing as it did almost equally to ear and eye, it was a type of what a lecture should be; not a student there but went away with an added fund of information,—which is far more than can be said of most of the lectures in a German university.

Needless to say, there are other departments to the Institute of Pathology. There are collections of beautifully preserved specimens for examination; rooms for practical experimentation in all phases of the subject, the chemical side included; but these are not very different from the similar departments of similar institutions everywhere. What was unique and characteristic about this institution was the personality of the director, and perhaps the best glimpse one could have gotten of this personality was to be gained by attending one of the demonstrative lectures of which a glimpse has just been given. First and last, these lectures covered the entire field of pathological anatomy. Many a physician from America, as from other lands, came to Berlin to hear them, and felt well repaid for the trouble. Indeed, this institute has been the fountain head of pathological knowledge ever since pathology took firm rank as an independent science.

# THE "LIGHT CURE" AT COPENHAGEN.

PROFESSOR FINSSEN AND HIS WORK.

BY JULIUS MORITZEN.

SOME six years ago the medical world watched with considerable curiosity the experiments of a young Danish physician, whose theories anent a "light cure" held out great promises. Since then the experimental stages have broadened until they include the realm of practicability. To day no name in the scientific catalogue is better known than that of Prof. Niels R. Finsen, of Copenhagen. Since the discoveries of Pasteur, the Roentgen rays are, perhaps, the most wonderful addenda to the history of medicine. But while the latter may be termed the search lights of the modern surgeon and his class, in the particular field he has selected Professor Finsen stands absolutely alone.

The aim of Professor Finsen and the Finsen Medical Light Institute is the conquest of superficially-seated consumption and cancer through the medium of both natural and artificial light. Many skin diseases yield to the methods employed by the eminent discoverer. From a purely æsthetic standpoint, therefore, the light cure becomes a distinct boon to mankind.

His researches and methods have opened up a territory almost unknown until Professor Finsen led the way, not ten years ago. Professor Widmark, of Stockholm, it is true, was the first to prove conclusively that sunburn is caused, not by heat rays, but through certain chemical rays contained in the light. Finsen himself does not hesitate to admit the validity of the other's priority. But still to the Danish physician is due the knowledge that such and such rays in the sun's spectrum are bacteria-destroying, while others are of a healing and curative nature.

Working on this principle, bringing to his aid the electric current, experimenting constantly, ill, yet subjecting himself to personal tests in order to be certain, Professor Finsen stood ready finally to let others judge him by his performances. The highest medical authorities in Europe and the United States have visited the Finsen Medical Light Institute at Copenhagen, and as a result of their approval almost every large city in the world is making ready to establish a plant for the treatment of such diseases as yield to the Finsen concentrated light.

With this much understood, the readers of the **REVIEW OF REVIEWS** will have little difficulty in

following the writer on his tour of investigation of the Finsen Medical Light Institute in the capital city of Denmark. It is the purpose here to explain succinctly, yet without omission, what Professor Finsen himself told on that visit to the

PROF. NIELS R. FINSSEN.

famous institution. Fortunately for the better understanding of things in general, the day is fast disappearing when men of medicine and science hold secret the knowledge which is the concern of all.

The new buildings of the Finsen Medical Light Institute are excellently suited for both research and clinical purposes. Located in Rosenvænget, a handsome suburban district of Copenhagen, the electric street-car service makes the institute easily available. No better evidence is needed as regards the rapid growth of the institution than the difference between the present spacious quarters and the low, almost barn-like, structure occu-

pied as recently as a year ago. Professor Finsen holds in no slight esteem the building where for five years he carried on his epoch-making investigations in the realm of bacteriology and of light treatment. To him the grand and larger complex is but another phase in the gradual advance; the ever-widening field where future problems can be met squarely with all the new methods that science can supply.

From first to last, the most vivid impression that a visit to the Finsen Medical Light Institute leaves behind is that of common sense. Whether it is Professor Finsen himself, speaking earnestly, enthusiastically, wrapped up entirely in the subject; whether it is those marvelous instruments, with their still more wonderful power of healing; whether it is the man or his method,—it all appears so lucid, so self-explaining, that little questioning is required. However, should it become necessary to direct an inquiry, it is met with a reply that sets every doubt at rest.

Professor Finsen, accompanied by two assistants, leads the way to the main hall. Here the head nurse is in charge of thirty-six young women, whose task is evident at a glance. Stretched out on tables grouped in fours, and arranged in a semi-circle around the hall, thirty-six patients are undergoing treatment. In order that the very best attention be bestowed, but one person is allotted each nurse at a time. For one hour and ten minutes at a stretch the treatment goes on, until the clock announces a recess, when another set of patients takes the place of those just treated.

And now Professor Finsen explains the meaning of it all. The majority of cases under treatment are of a particularly obstinate and disfiguring type of skin tuberculosis, *lupus vulgaris*. No certain remedy existed for the arresting of its progress until the Danish physician made the discovery that concentrated light could kill the microbes and heal the skin without leaving scars of consequence. Even with the light treatment, relapses still occur. It should be borne in mind that, by his previously established "red-light" treatment of smallpox, Professor Finsen had discovered a means whereby it could, in a measure, be successfully combated. He showed that by protecting the skin against the injurious action of the chemical rays of light it was possible to diminish the intensity of the inflammation. But, in the present instance, instead of excluding the blue, violet, and ultraviolet rays, as in the smallpox treatment, he makes use of their curative properties. All of which now seems very simple.

While Professor Finsen began his experiments with sunlight, and still employs the natural rays when weather conditions permit, yet the incon-

stancy of the northern sun has made it necessary to treat the majority of the cases with electric light. For this reason it is more to the point to dwell first on the construction of the electric-light apparatus, which, with their power of 20,000 candles each, are nevertheless so designed that the intense heat developed becomes nil as the tremendous glare strikes directly on the patient's face. It is this ability to utilize the chemical action of the concentrated light, and exclude the heat-giving quantity, which makes the observer look on in mute wonder.

The concentration apparatus consists of quartz lenses, framed in two brass tubes which can be moved, the one into the other, like two pieces of a telescope. Lenses of quartz are used because this material, in a far higher degree than glass, allows the ultraviolet rays of shortest wave length to pass through. For it is just these ultraviolet rays that have a considerable bactericidal effect.\* The apparatus for the concentration of sunlight, however, may be made of glass, since all the ultraviolet rays here have longer wave lengths.

In that part of the electric apparatus which faces the arc lamp two lenses are inserted. After passing from the lamp the divergent rays are here concentrated, and then they pass through the brass tubes, at the distant end of which they meet again with two lenses of quartz. Between these two latter lenses there is distilled water which cools the light by absorbing the intensely heating ultraviolet rays, but does not impair the blue, violet, and ultraviolet ones. Four such apparatus for light concentration are fixed around each arc lamp, the whole supported from the ceiling.

As far as the curative implement is concerned, everything has been done now to rob the light rays of their heat. But still the light is too hot to be turned on the skin without working injury. Therefore, since the light itself can be cooled off no further, the skin must be subjected to a cooling process. This is obtained through a little contrivance that consists of a brass ring closed at both ends with quartz plates. The brass ring also contains a small tube for the admission of running water and another tube to carry it off. By means of elastic bands the ring is now forced against that part of the skin that is to be treated. The cold, running water cools it off to such a degree that the skin can now stand a concentration of rays with a heating force sufficient to set fire to a piece of wood.

This little apparatus has the additional func-

---

\* Finsen thinks now that the violet, and even the blue, rays are curative also.

PATIENTS BEING TREATED IN THE FINSSEN MEDICAL LIGHT INSTITUTE, COPENHAGEN.

tion that it removes the blood from that part of the skin against which the ring presses. This very essential feature makes it possible for the chemical light rays to penetrate where otherwise the blood would absorb these rays. The water is carried through a rubber tube from a reservoir above, and after passing through the pressure apparatus, finds its outlet beneath the floor.

After the patient is placed on the table, which offers every facility for comfort and quick rearrangement of position, the nurse puts on a pair of blue spectacles, to ward off the strong light that is reflected on the pressure apparatus. Previously the physician in charge of that respective case has marked out the particular spot then to be treated. The size is about that of a ten-cent piece.

Almost immediately the treatment begins a decided inflammation sets in; something in the nature of sunburn. As the case is treated from day to day the reddish-brown lupus tissue disappears, giving way to a smooth, healthy surface. In this manner Professor Finsen and his able assistants have cured almost a thousand cases of this much-dreaded tuberculosis of the skin.

Now that the process is fairly well understood, it is the more interesting to let the eye wander over this unique hall, with its equal number of patients and nurses. The head nurse, a woman of extraordinary intelligence, who speaks English, French, German, and the Scandinavian languages with equal fluency, keeps a watchful eye that every detail is carried out as prescribed by the professor or his staff. Taking into considera-

tion that eight nationalities were represented at the moment of the visit to the Finsen Medical Light Institute, it becomes apparent how necessary it is that the one in immediate charge has linguistic abilities. None know better than Professor Finsen how much the physical depends on the condition of the mind. By offering his patients mental comfort, by making them forget for the moment that they are elsewhere than among their own, he assists the efficacy of his own discovery, and leads the way for a final cure. Unbounded gratitude is the part of those whom in this manner Professor Finsen has restored to society and their own self-esteem.

And so the great work goes on from day to day. Men and women of all ages and all classes, children of tender years, come to seek aid of this Danish physician. Let the description be as detailed as possible, let imagination supply that which description fails to tell, even then it is impossible to present a picture in complete consonance with what takes place. In the receiving room scores of people are waiting to have judgment passed on their particular affliction. Others, with bandaged faces, testify by their appearance that they are already undergoing treatment. A glance ahead, and there lies the great hall, with its electric-light apparatus under those red-covered shades that throw out a subdued effect. Bending to their tasks, the nurses watch with scrupulous care how the intense glare proceeds on its microbe-destroying mission. And over all, whether present or absent, hovers the dominating genius of the one man without whom medical science must have reckoned itself by that much poorer.

The treatment by sunlight differs in some essential points from that where the arc lamp is the agency. That is, in the open air tables are ranged side by side. The lenses, as will be seen from the illustration, are simpler in construction. But a tremendously strong light can be generated, and the water lenses used have the faculty of absorbing the ultrared rays, which give out much heat otherwise. If it were possible to obtain sunlight regularly, undoubtedly the out-of-door method would be the preferable one. But since the sun of the northern countries is a very fickle

quantity, Professor Finsen has come to the conclusion that the greater benefit lies in perfecting the electric appliances to such a point where the natural light can be dispensed with. As regards the relative strength of electric light and sunlight, Professor Finsen's experiments with microbe cultures has convinced him where sunlight kills the germs in a couple of minutes, electricity does the work in that many seconds.

One of the great advantages of the Finsen concentrated-light treatment in general is that it is absolutely without pain. The patients suffer not the slightest inconvenience. And those who have watched the progress of certain aggravated cases declare that the entire physiognomy of the patient undergoes a change. The eyes take on an added brilliancy. The carriage becomes more erect. It were as if a new dawn had risen, a regeneration where the victim of his disease is once more to be restored to his fellow men. It is in the moral aspect of the case that the Finsen treatment works such wonderful change side by side with the physical.

In the removal of birthmarks, such as portwine stains, from the size of a dime to those covering the entire one side of a face, the concentrated-light treatment has proved very efficacious. If physicians the world over would do nothing more than apply the Finsen light

cure in this direction, the discovery would have justified itself by its results. It is comfort to know that this facial disfigurement is doomed at last.

For anæmic patients, Professor Finsen has experimented successfully with what he terms his photo-chemical baths. He claims that the red color of the exposed parts of the skin is caused principally by light. Hence his effort to restore the deficiency by subjecting the anæmic patient to what is probably one of the most powerful arc lights ever constructed.

In the room set apart for this treatment the patients walk about naked, except for broad-brimmed straw hats to protect the eyes. There is no glare, however, notwithstanding the tremendous light force generated, for the walls and the ceiling are tempered in yellow tones. The effect of this treatment is said to be exceedingly pleasant, a sense of exhilaration taking possession of the entire nervous system. A number of cures have already been reported, and there is every reason to believe that in this direction, likewise, Professor Finsen has taught the medical profession a valuable lesson in therapeutics.

On the flat roof of the main building the sun baths take place. As in the room with the artificial light, here, too, the entire body of the patient is exposed to nature's health-giving rays.

THE LABORATORY, FINSEN MEDICAL LIGHT INSTITUTE, COPENHAGEN.

The sun bath as a complete health restorer, however, is as yet a matter of the future. This much Professor Finsen himself admits.

If the visitor, like the writer, is fortunate enough to gain admittance to the great laboratory, here he is brought face to face with what may be termed the cause, the effect of which is to be met with everywhere in the Finsen Medical Light Institute. By day or by night, as circumstances decree, the professor and his associates here pursue their studies in the realm of microcosm. Whatever new problems are to be solved by Professor Finsen, this splendid laboratory will assist in making practicable. For it is not for the sake of experimentation, but because he wants curative results, that Professor Finsen has sacrificed his own health and comfort that others might be benefited through his researches.

Niels R. Finsen was the son of a well-known Icelandic functionary; he was born some forty-two years ago on one of the Faroe islands. His early education took place in Iceland, and from here he went to Copenhagen and entered the university for the purpose of studying medicine.

It was in a small attic room of the old surgical academy building that Professor Finsen began his first investigations touching the effect of light on the human organism. Sophus Bang, a fellow student, now considered one of Europe's first anatomists, shared Finsen's enthusiasm as regards a complete reform of medical therapeutics. All kinds of schemes for the betterment of mankind were constantly discussed by the young students. Then ill health came to both. Bang sought refuge in Switzerland, where he gradually regained his strength, while Finsen remained at home to fight his battle single-handed against the disease that ever since has held him in its relentless grasp.

But ill health, which left him a badly shattered constitution, did not deter from pursuing the studies he had begun of his own accord. He was considered little short of queer when he began discussing the influence of sunlight on the human organism. True, it was admitted by the medical world that light influenced all animal life, but Finsen was alone in declaring that sun rays held the keys to a new method for treating certain diseases.

In 1890, Professor Finsen graduated from the Copenhagen University. Gradually it became clear to the skeptically inclined that there was much of common sense in what Finsen claimed for his discovery. Then, in an article, "The Influence of Light on the Skin," published in *Hospitaltidende* for July, 1893, he aroused general attention by declaring that in cases of small-

pox cures could be effected by placing red curtains before all the windows of the sick room.

This was the beginning of what was to prove Professor Finsen's reward. In 1894, the year following the publication of his article, smallpox became epidemic in Copenhagen. Now was the time to put the matter to a test. Shortly previous, Dr. Svensen, of Bergen, acting on the suggestion, had tried the "red-room" treatment with splendid results. Professor Fjellberg now did the same thing with the Copenhagen smallpox cases. Everywhere the medical fraternity applauded the results obtained; especially because, by preventing suppuration, the disease could run its course without leaving those dreaded scars.

While medicine had gained a grand victory, to Professor Finsen the "red-room" treatment was only a negative result. Instead of excluding the light rays, as in smallpox treatment, he wanted the "positive" side made applicable; the best use of the chemical light rays for curative purposes. To gain this end he experimented on a lupus patient at the electric light station. The sufferer, who for more than eight years had tried every remedy to get rid of his distressing malady, but without success, was restored to health through the concentrated light cure. And now both moral and monetary assistance came to the discoverer of the treatment.

In 1896, the Municipal Hospital of Copenhagen placed a piece of ground at the disposal of Professor Finsen. Here were erected several buildings,—unpretentious, it is true, but sufficient for the time being. The Finsen Medical Light Institute was organized through the munificence of Messrs. Hagemann and Joergensen, two wealthy residents of Copenhagen. The Danish Government likewise gave a considerable sum for the furtherance of the institution which, beginning with two patients, now treats hundreds daily. On an average, the cases treated are of eleven years' standing; one individual, having suffered from lupus forty-five years, likewise showing marked improvement. But, as a matter of course, where the concentrated-light treatment is begun in the earlier stage, improvement and permanent cure follow much more rapidly.

With its removal to its present quarters in Rosenvaenget the Finsen Medical Light Institute has entered on its career of real stability. Every department is organized on a basis of best results. Professor Finsen has himself charge of the laboratory, with Dr. Forchhammer as chief physician, and Dr. Reyn the first assistant. The staff includes chemists of national renown, expert electricians, and nurses whose work is absolutely unique in the profession of healing.

# THE PHILIPPINE CONSTABULARY AND ITS CHIEF.

BY JEREMIAH W. JENKS.

[Professor Jenks, of Cornell University, has returned to this country after a year spent in studying colonial administration in the Orient, with particular reference to Philippine problems; and he was engaged last month in putting the finishing touches upon a valuable report he is making to the Government at Washington. We are glad to print here Professor Jenks' tribute to the thoroughness and excellence of the new constabulary system of the Philippines as devised and carried on under the direction of one of our typical army officers. Next month we shall publish from Professor Jenks' pen a comparative *résumé* of the systems of civil administration now existing under the Dutch in Java, the British in the Straits Settlements, the French in Indo-China, and the Americans in the Philippines, with perhaps some other examples of colonial government.—THE EDITOR.]

THE attention of the American people has, for the last few years, been so steadily directed to the work of the American army in the Philippines, that few have thought of the native Filipino army loyal to the United States, which at the present time, practically throughout the islands, has largely taken the place of the American army. When the last work of the American army against organized opposition in the Philippines, "the chinking" after small scattered troops in the forests and mountains,—had ended, there fell to the new Philippine constabulary the work of seeking out and bringing to justice the small bands of brigands which lurk in the neighborhood of the larger places. Such bands flourished in certain localities in the Spanish days, and it was to be expected that they would be found in the Philippines, as in every country, following a period of disorder.

Realizing this fact, the Philippine Commission passed a bill on July 18, 1901, providing for an *armée constabulaire* under the supervision of the civil government, whose function it should be to maintain peace, law, and order in the several provinces. The body was to consist of not less than seven or more than one hundred and fifty *brigades* *compagnies*, properly officered, for each province together with an American chief, upon whom should rest the duty of organizing and commanding this body, and various American assistants, chiefs and inspectors. The minor officers, sergeants, corporals, etc., were to be natives selected from the provinces in which they were to do their work.

The plan of having order kept among a semi-lawless people by a military police selected from the neighborhood is distinctly contrary to that followed in most of the colonies of England and Holland in the far East. In those countries it is thought unsafe to trust natives to fight their own neighbors; and the native police who serve

in British or Netherlands India are invariably recruited from remote provinces. Our government, however, believed that plenty of recruits could be found loyal enough to the Americans and determined enough to secure good order, so that they could be trusted to quell disorder and bring criminals to justice, even in their own neighborhood, while their knowledge of local conditions would give them a decided advantage over any troops brought from a distance. Experience has justified this belief.

The task of organizing and commanding efficiently such a semi-military body,—whose work, nevertheless, was to be much more varied, no less dangerous, and no less important than that of the regular soldier,—demanded military and executive ability of the highest order. The selection of Capt. Henry T. Allen, of the Sixth United States Regular Cavalry, formerly senior major of the Forty-third Volunteer Infantry, showed the good judgment which has been so generally employed in filling positions of responsibility in the Philippines. Captain Allen is a distinguished example of the high type of men that have been placed at the disposal of our civil and military governors in the Philippines. His record shows also what opportunities are given to men of ability and character in our army.

Born in Kentucky in 1859, after completing his course at West Point, he served, during some period of his active service before going to the Philippines, in Idaho, Montana, and other parts of the West. In the years 1884-85, he was put in command of an exploring expedition in Alaska, where, amid what for ordinary men would seem to be insuperable obstacles of cold and ice, fatigue and starvation, he carried out against desperate odds the work assigned him by the government. His fellow officers, even to-day, say that nothing but the courage and resources of this young lieutenant of twenty-five years saved

CAPT. HENRY T. ALLEN, U.S.A.

the lives of the party. The simple, business-like narrative of this work in Alaska gives to any one who has power to read between the lines an insight into the possibilities for showing heroism and endurance that are called for from our soldiers in time of peace. Such work is a new kind of "victory of peace" that calls for courage and daring, physical as well as moral. The commendation of his commander, "for courage, fortitude, tenacity, and ability in exploring the unknown regions of Alaska," is the brief military compliment which most civilians would have expanded into a eulogy.

Owing to Captain Allen's uncommon gifts as a linguist, and to his attainments in military science, he was made one of the instructors at the Military Academy in the year 1890. Afterward he was sent to St. Petersburg as military *attaché* in the years 1890 to 1895; and later he was given a similar position in Berlin, where the Spanish war found him.

A man who is spoken of as "having a special knowledge of diplomacy," who reads and speaks readily "French, German, Russian, and Spanish," besides having "some knowledge of Swedish," and some experience in banking, as well

in scientific exploration, is a man peculiarly well fitted for the important semi-diplomatic position of military *attaché* in an important foreign embassy.

His more strictly military record is scarcely less striking than his scientific. In the Cuban war he was commended for his "great gallantry and his conspicuous example and energetic measures" at an attempt of the Spaniards to surprise our troops near Santiago de Cuba. He was recommended for promotion on account of "distinguished gallantry" at El Caney.

In the Philippines he was recommended for advancement for "distinguished and meritorious services, military and civil," while in command of the island of Samar, and similarly recommended, for like reasons, for his services while commanding the island of Leyte. In all these cases he was in command in arduous and dangerous expeditions against the enemy, showing everywhere energy, gallantry, and military skill. One of his superior officers speaks of him as "One of the best officers I know." Another says: "He is an officer of the highest qualifications, and a gentleman in the highest sense of the term."

From these brief military records it is seen how well fitted a man our governors of the Philippines found to put in charge of the most important work of commanding the Philippine constabulary.

He organized the force from the bottom up. Through gradual enlistments this has become a regular body of about five thousand men, scattered throughout the islands. Under its general supervision is placed to a considerable extent the local police, so that indirectly the chief of con-

stabulary has under his oversight in the neighborhood of twenty thousand men. Under the same officer falls the distribution of supplies to the constabulary as well as to the insular and provincial officers of the islands. The constabulary administers in certain provinces the provincial jails, together with all telephone and postal lines, and practically, in certain quarters, the telegraph lines as well. The necessity of keeping track of all movements against the public peace compels the higher officers to follow the press of the archipelago, in order to keep in touch with the various movements of dangerous agitators, as well as to do the more direct work of watching well-known criminals. Attempts are made from time to time by some of the more ambitious of the criminal leaders to organize not merely a local band of brigands, but also a widespread outbreak, in order that their opportunities for plunder may be increased. These attempts, for the last year or two, have been practically all discovered by the constabulary and promptly suppressed by the arrest of one or two leaders long before they have reached the stage of any serious disturbance of the peace.

No one can appreciate the difficulties of our new work in the Philippine Islands, and the skill and boldness with which those difficulties are met and overcome, who does not look carefully into the working of this scheme of organizing and managing what is practically a loyal native army enlisted, to a considerable extent, from the ranks of the insurrectos themselves. So, too, nothing can make an American prouder of his country than to see that, serving modestly in inconspicuous places in our public service, we have men like Captain Allen.

---

## THE ARCHBISHOPS WHO CROWNED THE KING AND QUEEN.

THE Primate of the English Church, the Most Reverend Frederick Temple, Archbishop of Canterbury, who was so prominent, and, in his touching physical weakness, so pathetic a figure at the recent Coronation of King Edward, has been a power in the religious life of the English Church for well-nigh half a century. He is the son of Major Octavius Temple, who, at the time of his birth, November, 1821, was resident in the Ionian Islands, then part of the British Empire. They were ceded to Greece in 1864. The future archbishop's education, however, was entirely English,—first at Tiverton, in

Devon; then at Balliol College, Oxford, which in those days, as now, was distinctively the resort of honor-men, among whom Frederick Temple won distinction, gaining a first class in classics and mathematics, and as a result of this, a fellowship, which he held from 1843 to 1848. The educational career then attracted him. He became principal of Kneller Hall, and, after eight years of growing distinction, was appointed inspector of training colleges in 1856, and headmaster of Rugby,—a school that had attained world-wide renown under Dr. Arnold,—two years later. This office he held for eleven years with

THE ARCHBISHOP OF CANTERBURY AND THE ARCHBISHOP OF YORK.

distinction. Then the Church reclaimed her own, and he was consecrated Lord Bishop of Exeter in 1869, whence he was translated to London in 1895, and to the primacy in 1896. The future archbishop bore a brave part in the controversy that centered around "Essays and Reviews," which in the religious thought of the

60's took much the same place that "Lux Mundi" was to do thirty years later. Though a distinguished and forceful preacher, the archbishop has published little. A volume of sermons at Rugby, and a series of Bampton lectures on the "Relations between Religion and Science," may be noted.

His colleague of York, the Most Reverend William Dalrymple Maclagan, is five years the junior of Archbishop Temple, and the son of an army physician. Of Scottish birth and training, a graduate with mathematical honors of Peterhouse College, Cambridge, he served for five years in the Indian army, from which he retired with the grade of lieutenant in 1852. It was not until four years later that he took his first clerical orders. In 1869 he was appointed rector of Newington, and vicar of Kensington, a part of

London in 1875. Three years later he was appointed Bishop of Litchfield, and in 1891 translated to the Archbishopric of York. He shared in the editorship of "The Church and the Age," two volumes which thirty years ago attracted much attention, and collected, in 1891, a volume of "Pastoral Letters and Synodal Charges." It was his traditional prerogative to crown the Queen after the Archbishop of Canterbury had completed the more elaborate ritual that marks the consecration of the sovereign.

## THE WORLD'S FICTION FOR A YEAR.

BY TALCOTT WILLIAMS.

FROM 8,000 to 10,000 novels yearly appear the world over. They are but a share of the earth's great stream of print, but they are the largest share. Japan contributes a round half thousand,—in 1895, 462. There are a couple of hundred in India,—letters in India still turning to verse in preference to prose, as in primitive Vedic days. The Arab world has its scattering scores; in Egypt, three to five yearly; in Syria, a few dozen. Strange works they are. Some Presbyterian friends of mine aided to equip a reading room for Arab immigrants, and were aghast at the new novels when a neat typewritten translation of a few pages was spread before them. It was odd—for a Presbyterian reading room. Not in Arabic. The East is open-minded and open-speeched, and ever its fiction harks back to the plain-spoken men who sit in the curving ring of listeners in the market place, telling tales as old as Hammu Rabbi and as new as the Arabian Nights in the hands of a child. Japanese fiction is passing from the interminable Chinese romance to fiction modeled on the European novel. In north-west India, Moslem Lucknow, on the appointed day, fills the street where the monthly numbers of the last romance come fresh from the press. One which had a prodigious vogue a dozen years ago carried a modern hero through prodigies of valor in the Russo-Turkish war. For a decade past in India vernacular fiction, as in Arabic, is taking the place of the tale modeled on old classic examples. The world of the novel, like all worlds, is coming to be alike the world over.

Italy and Spain, between them, issue from 500 to 600 novels in a year, the larger country the larger half. France, the world's school-

master in fiction, prints 600 volumes a year. Scandinavian Europe as many more, centering for publication at Copenhagen. Russia supplies, on an average, year by year, from 800 to 1,000. Its vast millions are unlettered, but the appetite of its small educated classes, social conditions, and the absence of libraries and newspapers, stimulate reading. When the copyrights on Pushkin's poems expired, the first twelve months saw 183 editions and a circulation of 2,000,000 copies. What English poet is likely to have this compliment? Each lesser tongue in Europe has its hundred or two of novels, but the editions are small. A sale of 8,000 to 10,000 copies is the limit of success for a new Hungarian novel.

### THE TEUTONIC RACE GIVES THE FLOOD OF FICTION.

The great flood of novels comes, after all, from the two great branches of the reading Teuton race,—from the 70,000,000 who speak German and the 120,000,000 who speak English. Together, these tongues yearly issue nigh 4,000 titles in fiction, juvenile and novels together,—half the world's stories. In 1901, there were issued in this country 914 novels and 434 juveniles. England had of both classes 1,513. Germany published, in 1901, 3,406 issues in belles-lettres, novels, drama, and verse. In 1898, out of 3,061 such works, an analysis showed that 1,856 were novels and juveniles. In 1901, there were about 2,000. Duplications reduce the new fiction of Great Britain and America to some 2,000 separate titles, about one-third written in this country and about two-thirds in England. German fiction, it must be remembered, includes all greater Germany,—Austria as well as the more northern empire; the German of Switzerland as well as of Russia and that outlying fringe in other

lands, where, as in Belgium or Holland, there has begun a German renaissance on the border. The fiction of the English tongue runs by strange streams, and the sheets on which its most original living genius first appeared in print were damped down by the Ganges.

No full list of the issues of English fiction in a year is ever known. No fiction compares with it in circulation or in audience. France once led all Europe in the circulation of its novels. It is barely thirty years since James Parton, in discussing literary earnings, pointed out that French men of letters alone gained a comfortable competence, because they alone wrote for all Europe. This has ceased. The growth of national spirit since 1848 has rendered literary consumption regional. A single French novel in a year may reach 100,000, as may this year M. Willy's "*Claudine en Ménage*;" but in the English-speaking world "*Audrey*" began last February with 100,000 copies. Miss Corelli's "*Temporal Power*" has just opened its sales with an edition of 125,000. At least four novels,—Mr. Wister's "*Virginian*," Miss Rives' "*Hearts Courageous*," Mr. Hough's "*Mississippi Bubble*," and Mr. Major's "*Dorothy Vernon*," all American,—exceed any French or German novel of the year. Even in the circulation of "*Sir Richard Calmady*," estimated at 30,000, "*Lucas Malet*" (Mrs. Mary K. Harrison), probably exceeds the demand for M. Bazin's "*Les Oberlé*," the second French success of the year. In Belgium a run of four editions excites remark, and M. Maeterlinck has not improbably had a far larger circulation in translation in English than in his own country in the original.

#### FICTION EDITIONS SECOND ONLY TO SCHOOLBOOKS.

Short of schoolbooks, no editions in any land equal those of fiction, and their titles average a fifth of those published of substantial books. Only those who check the various returns which appear from time to time of the "books" published in various countries are aware how illusory these are and how misleading in comparison. Nothing awakes confidence like an erroneous statement carried out to units, or, still better, worked out in a percentage to the fourth decimal. In countries like Japan and Germany, where a record is made of all issues not periodical, though of only four pages, the yearly number of publications of all orders will rise to 25,331 in Germany in 1901, and 26,965 in Japan in 1895. German university theses alone,—most under 100 pages,—give 5,000 to 6,000 titles in this list yearly. If only new "books" of a substantial size, excluding directories, almanacs, annuals, and mere routine

lists, like college catalogues, be included in the tale, as is the habit here and in England, the number of "books" issued in 1901 will be,—United States, 5,496; Great Britain, 4,955. On this basis there are from 45,000 to 55,000 new volumes issued yearly from the presses of the world. Germany has of these 9,000; England and the United States as many more, deducting duplicates separately noted in each; France and Russia 6,000 each; Italy and the Norse lands, 3,000, and the rest of the world's lands run at about 2,000 each. India, a continent in itself, has about 7,000 a year, though no one presidency and no one tongue has over a third of this number. The world's publications would in a decade fill the largest library in this country, and in twenty exhaust the shelf-room of any library abroad. The flood grows, but at a varying speed. In seventy years ours has deepened twentyfold, doubling every twenty years. In 1833, there were 274 works by Americans and 206 by foreigners published in this country, old and new. The number, old and new, American and foreign, in 1901, was 8,141; but the proportion was altered slightly,—4,701 were by American authors, new and reprints, and 3,440 by foreign writers, old and new, English and European.

National initiative has, after all, made but slow progress. A little over half of our book consumption came from abroad two generations ago. A little less than half now. Germany, like the United States, has doubled its book output in two decades; in Japan it has grown some fivefold; but the total has remained substantially unchanged in England and France. Here, as in so much else, these two lands have reached the top of their progress curve, and maintain a fixed norm. The average yearly output of letters and of books has not changed 10 per cent. in either in twenty years. Russia, like the United States, has doubled. So has India. Italy has grown a third. This record of the annual issue of books is a singularly accurate and penetrating measure of the relative movement of lands in the world current of national evolution and devolution.

#### TRANSLATED FICTION RARELY SELLS.

Novels are the largest single group in this great flood of volumes. They are the only interchangeable form of the higher letters. No good poems translate. Some translations are better than others, but no man born to a tongue ever saw its better verse in translation without a qualm. Even plays call for "adaptation." Novels translate. Yet the fewest novels have had a notable circulation outside of the tongue of origin. From 50 to 100 novels are yearly published in translation here and in England. Out of 500 or

so issued in the last five years, only one, "Quo Vadis," has won a place among the "best-selling" books. Zola's books are prodigiously talked about in the papers. After the first one, "L'Assomoir," none has sold. The sales of even Tolstoy are small measured against the native novel. But foreign translations have a visible and immediate effect on the native novelist. These exotics cross-fertilize the native bloom, and it sets to fruit of a new flavor. Zola gave realism. Tolstoy modified Howells' methods, and dull pages came, absent from "Their Wedding Journey." "Quo Vadis" began,—though "Ben Hur" should and did not,—the sacred novel, half a dozen appearing this year. The influence of French models is on every page of younger men who write with care. But, as every bookseller will tell you, and as every publisher knows, the translated novel may lend dignity to a list; it does not add thousands to the aggregate circulation of the issues of a firm.

NATIONAL TASTE DEMANDS A LOCAL COLOR FOR NOVELS.

In nothing is the national taste more local than in fiction. The ultimate method of the higher verse is alike in all tongues. If you are fortunate enough to be born to more than one tongue,—and no laborious linguistic acquirement in later years equals this in illuminating literary pleasure,—there is no witchery more inexplicable than the fashion in which higher verse will

HENRYK SIENKIEWICZ.

charm and yet refuse transfer to another tongue as familiar. As with Hindu caste, salt sea and boundary line deprive verse of its incommunicable superiority. Great poems are essentially one. Novels, like a local flora, reflect soil and climate. With all modern communication, the novels of various lands not only have inflected differences of tongue and temperament, they occupy separate fields, and address themselves to different tastes. French novels, so easily foremost in form, address themselves to definite social and personal problems. Where else does novelist after novelist find readers willing to follow him through a cycle, as has almost every Frenchman of the first rank in fiction. Empty "Gyp's" fiction may be and full of bald suggestion, which the most brazen of American bookstalls would not put on sale; but even the Comtesse de Martel is full of purpose, and never forgets her kinship to Mirabeau. When Mrs. Atherton implies a political creed and propaganda in "The Conqueror" it strikes the American as slightly humorous. Zola led France. Could any American novelist or English do as much in his land? What porridge had Thackeray?

The Spanish novel as distinctly deals with local, regional, and provincial life taken as a whole and treated as a unit. Was ever the integral life of a provincial town so completely set before the reader as in the "Fourth Estate" by Armando Palacio Valdes? The isolation of the

MAXIM GORKY.

Peninsula, its early kingdoms still showing their boundaries across the map of the monarchy, the fixed social life of a community which lost its initiative when it burned the Protestant in the north, slew the Moor in the south, and expelled the Jew from both, these all unite to breed the defined study of definite types. As D'Annunzio illustrates in "*Gioconda*," or Matilde Serao in the "*Ballet Dancer*" and "*On Guard*," two authors poles apart in style and method, the Italian has as distinctly the distinct power of making a detached mood live,—the same power to isolate emotion and use it to personal ends which has given the Italian his detachment from faith, his attitude toward religious emotion, and his dominance in the affairs of the Church. The German novel is as clearly domestic. Its pages reek with personal relations. The first novel in the tongue is, after all, an educational treatise. When a newly-awakened tongue like Magyar turns to the novel, it runs in the last half of the last century, as other lands had earlier, through the long and descriptive historic cycle,—as in Jokai's two hundred novels,—accomplishing what Scott did for his land, not only for the annals, but the scenery of Hungary. In similar fashion, in Bohemia, under the Czech renaissance, Alois Jiráček has passed down the history of his land in a long series, "*U Nás*" ("*With Us*"), which has in the past year's issue reached modern times. The Polish novel oscillates between the historic revival in fiction, as in a familiar series, in a land permitted no historic revival in fact, and the introspective speculation of the Pole, which always prevented national decision, as by Sienkiewicz in "*Without Dogma*" or Eliza Orzeszko's "*Argonauts*," a study of social conditions. Turgenieff, Tolstoy, Gorky,—what are these but the successive awakening in Russia of the educated, the noble, and the serf? Pontoppidan, in Denmark, now at the end of a long life, has given his great work to the awakening of Denmark half a century ago, which has turned starving sandy tracts into the most profit-yielding farms in Europe, and no Danish novel but reflects this singular victory of the high school and this singular defeat of liberalism by the directing class. Nor need one, to complete the picture, remind the reader how completely the ordinary English novel has become a mere social chronicle, while the American still flounders, its field undiscovered, vibrating, when popular, between a picture of folk life and historical romance.

With this world flood of fiction no critic, however great his industry or wide his knowledge, can expect to have even a paper-knife acquaintance. It taxes any man's efforts to maintain a direct and personal knowledge of the

notable novels in his own tongue. The usual acquaintance of an educated man with the tongues of the East and West will permit him to report,—it would be dishonest to criticise,—the general direction of this fiction, frankly using those secondary sources by which the journalist, through a wide, if distant view, brings within the range of his reader the affairs and the politics of other lands.

#### FRENCH NOVELS OF THE YEAR.

M. Zola has lived to see his method, proposed as final in French fiction, already abandoned, though the philosophic teacher who gave him his first impulse,—Taine,—inspires M. Bourget. It was apparent a year ago in "*Un Homme d'Affaires*." It is as plain in "*L'Étape*," a novel in which he has sought to show how useless it is to hope to build a stable French life, save on the foundation once laid by the monarchy. M. Édouard Estaunié, in "*L'Épave*," the life of a small town, continues in the narrow compass of a cabinet piece his pitiless pictures of the provincial life of republican France. He, like M. Bourget, is carrying on a political polemic. Popular interest turns rather to the sentimental appeal of M. Bazin's picture of Alsatian life under German rule in "*Les Oberlé*," the young Alsatian still enamored of a France from which he has been sundered, a work with that singular power of sketching a region rather than characters peculiar to French letters. M. Jules Claretie makes another appeal to the wounds of the past in "*Le Sang Français*." The sons of a Metz general, M. Paul and Victor Marguerite, continue their cycle on 1870 in "*Le Désastre*," a minute study, while M. Paul Adam turns an earlier page and recalls a note struck by Musset, in "*L'Enfant d'Austerlitz*." Books like these are reviewed. The book which is read is the flagrant but skilled record of the nether depths, by M. Willy, in "*Claudine en Ménage*," the success of the year so far as popular circulation goes.

#### THE NOVEL SECOND TO THE DRAMA IN GERMANY.

German letters to-day live in the drama. In leading the day's future, it has taken the place once held by France. The novel has become a secondary matter in which the long conflict over old and new romanticists is stilled. What interest can the foreign observer take in Adolf Wilbrandt's development of the value of work as the great teacher in "*Ein Mecklenburger*," the slow growth of the "noble character," the old maid, "*Cäcilie von Sarryn*," of Georg von Ompfeda, the musical schoolboy genius of Emil Strauss' "*Freund Hein*," or the two philanthropists, one of the alley and the other of the field, in "*Aus der Triumphgasse*," by Riccarda Huch.

Photo by the Misses Lally, New York.

MISS HALLIE ERMINIE RIVES.

and "Jorn Uhl," by Gustav Frenssen, a Protestant clergyman? These all do credit to the German heart. How little do they move a foreign attention.

The ideal is the only universal national solvent, and Maeterlinck's "Le Temple Euseveli," translated as "The Buried Temple," on the dividing line between essay and self-revealing fiction, is perhaps the first use of the subliminal self in higher letters, a fact of life and a principle of analysis destined to decide the current of the humanities for the next half-century.

#### THE SITUATION IN SPAIN, ITALY, AND RUSSIA.

Spain has this year but a group of rising young men, whose names as yet mean nothing. In Italy, Gabriele d'Annunzio has given himself to a play, "Francesca," of dubious success, and the only other novelist known to those without, Matilde Serao, has turned from the task of defending herself and her newspaper from the charge of complicity in the Neapolitan Tammany, to publish "Lettere d'Amore." So wide a shadow may the ill success of an "English-woman's Love Letters" cast, though their fame has not helped to success "A Modern Antaeus," by their author, Laurence Housman, one of those books in which the hero is slowly made by hand, page by page, from school to his death-bed. Russia has a new man of short stories, Leonid Andreev, whose first volume has sold like Gorky's, to-day leading Russian sales.

#### IN AMERICA,—"THE VIRGINIAN."

Novels, like all the works of men in the field of letters, have two tests—the demand of the general and the judgment of the trained; but there is this difference, that while it is really of no consequence to the man who writes great verse whether it is read or not,—he can wait,—the novel, like the newspaper, is written to be read. The novel of the year, like Owen Wister's "The Virginian," sometimes bears both tests, and sometimes, like Mrs. Edith Wharton's "The Valley of Decision," it bears but one. Of American novels this stands alone for distinction of style, for sheer architectonic quality. The average reader found it dull. If you know your Italian eighteenth century, following it to its unsavory lairs in Goldoni and him of Seingalt, if scenery appeals, and you love both the things of the outer life and the inner soul, you will wonder that every one has not read a book which has indeed had, in proportion to its importance, but a moderate sale, handicapped besides by its two volumes.

"The Virginian" has sold. It began years ago in the honest attempt to preserve to the future a fading Western life. This gives it the flavor of the document. The Virginian is the best thing we have done on this side the water; but he will not work, and it is a happy

MISS ANNA DOUGLAS SEDGWICK.

CHARLES MAJOR.

idea to put him, as so many of his class and kind have put themselves, where he has about him deserts of idle hours. Episodes interest the American. There has come, too, if one trace Mr. Wister's stories through the years, an access of philosophic insight. He thinks. This is not common in novels. Given these and a careful habit of writing, and there follows the one book of the year which has marched to great though not record-breaking success under the suffrage of buyers.

#### AN ABRUPT PAUSE IN BIG SALES OF NOVELS.

The year of American novels is without its array of vast circulation, because it has been without any books deserving it. Three years of big sales had bred the comfortable impression that everybody will buy anything. Everybody will not. The Booklovers' Library and the Tabard Inn may play their part, but there has been an abrupt pause to the big sales of the past. These are of two kinds,—sales to the trade and sales to buyers. It is too early to say whether Marie Corelli's "Temporal Power," which begins with the first, will go on to the second. Miss Corelli, who stands in her vogue for the same sort of thing which breeds Christian Science,—inability to know a fact when you see it or to have a logical idea,—will sell in England. Her sales

here are less. In this book she has left spiritism for politics, and turns a king into a leader of impossible men in an impossible realm, with evident conviction that she is it.

These three books have, for widely different reasons, a distinct place in the year's fiction. The other novels of the year group themselves. Two authors of great vogue in the close past,—Miss Mary Johnston in "Audrey" and Mr. Charles Major in "Dorothy Vernon of Haddon Hall,"—have tested fate once more. Both began with great editions, and both have sold, but neither book has cast any shadow. Miss Johnston has written rather better than before, is more skillful, and all the reviewers agree that it is quite wonderful,—this picture of old Virginia and the eerie maiden,—but the new book lacks the touch that moves. Mr. Major is "dramatic." He too has taken more pains than before. There are the same tempests, and this young woman, like the other, tears passion and her clothes to tatters. Mr. Henry Harland, in trying, on his part, to repeat a past success, has the advantage that it was based not on plot, romance, and a capacity for incident, but on the power to write with skill on picturesque subjects, used as the setting for a shrewd knowledge, not of human nature, but of human types. While Mr. Harland writes in English, he thinks in French, and "The Lady Paramount," one might almost say, was painted on the lid of the "Cardinal's Snuff-box."

OWEN WISTER.

## THE SUCCESSORS OF SUCCESSFUL STORIES.

The American public is in nothing more alike in all its acts than in the fashion in which it requires each new plea for favor to rest on its merits. In England, an author who has once

"JOSIAH FLYNT."

sold, sells again; not here. "Castle Cranecrow" does not gain because its author, Mr. G. B. McCutcheon, wrote "Graustark." Mr. Will N. Harben in "Abner Daniel" has improved on "Westerfelt," but it is doubtful if this close study of Georgia life wins a like attention, with its evident realism. This local chronicle is still at the point where it is more anxious to spread local color over the picture than to make the picture. Miss Nancy Huston Banks has taken Kentucky for "Oldfield." "The Desert and the Sown" adds the skill of the story-teller to the vision of the Western mountain, but lacks the substance of Mrs. Mary Hallock Foote's past work.

Two novels, "Hearts Courageous," by Miss Hallie Erminie Rives, and "The Mississippi Bubble," by Mr. Emerson Hough, are fitted to large sales and lavish advertising as a coat is fitted to a man. They are chosen for their purpose with unerring judgment. The Revolution in Miss Rives' book, an earlier period in Mr. Hough's, a clear style, much movement, action, familiar figures given life, a fresh hand,—out of these a year's success comes. Of a very different sort is Mrs. Gertrude F. Atherton's "The Con-

queror." Here there is the direct attempt to reconstruct an historic character, Alexander Hamilton. It is not Hamilton, but a figure full of Greek fire, a sort of woman's statesman. True or not, it has made its mark on its readers. This was scarcely true of two historical novels by practiced hands, one suddenly stilled by death,—"Kate Bonnet" (piracy story), by Frank R. Stockton, and "Dorothy South" (Virginia before the war), by George Cary Eggleston. Neither has here the characteristic quality of its author. Nearly three score of these historical novels have this year appeared, and their number has been swollen by the notable increase of publication at the author's expense.

## HOWELLS AND HENRY JAMES.

In the recognized group of novelists who yearly make their appearances, Mr. Howells and Mr. James lead. To one equally interested in the vote of the many and the verdict of the few, there is something pathetic in the middle-aged novel like "The Kentons," with the atmosphere of the seventies on every page and a Dutch capacity for painting in the round the arid annals of this Ohio family, whose daughter falls in love in the right way with the wrong man and in the wrong way with the right one. "The Wings of the Dove" returns to Mr. James' earlier subjects and retains his newer method. How amazing and how exasperating that a man can write like this, produce this unique effect of woven words, and yet leave you, so far as reality is concerned, in this picture of the contact between the American and English, with the shimmering sense of the cinematograph, which always seems to be and never is the real thing.

In "Captain Macklin," Mr. Richard Harding Davis has the precise fighting hero who stirs and wins. This man has blood in his veins, not ink. With him, "Ranson's Folly," and "In the Fog," Mr. Davis has suddenly emerged again, and readers swarm once more. Sir A. Conan Doyle has recurred to an earlier popularity in the "Hound of the Baskervilles," in which the method of an episode is applied to a longer span. Mr. Fergus W. Hume has repeated his past, "The Pagan's Cup" brimming with artificial mystery.

## NO NEW POPULAR AUTHOR THIS YEAR.
